**OVERMAN**—has been less active than during the same time last week, declining from \$45 to \$38, improving to \$51, then selling at \$40@49, and closing at \$45. Since our last issue, the hullion receipts of this company amounted to about \$4,000, showing a yield of over \$34,000 for the current month.

**IMPERIAL**—is in better favor, selling at \$133@138, and closing yesterday at \$129. The receipts of hullion since our last issue aggregate \$8,242, making a total of \$33,995. The receipts for the month will be less than the returns in September. The mine shows no material change, except that it produces a lower grade of ore. Mr. Bourn, the President, and several of the Directors have gone to Virginia City on business pertaining to lawsuits against the company.

**GOLD HILL QUARTZ**—sold at \$85@90. Our quotations at the close are \$85 bid and \$95 asked. The 290-foot level continues to yield well. Receipts of hullion in October amounted to \$10,994 against \$3,259 04 in September. It is believed that no dividend will be paid during the present month.

**OPHII**—opened at \$29, then sold at \$65@50, assessment of \$36 per foot delinquent, and at the close realized \$52. The water is decreasing in the shaft, and sinking appears to go on satisfactorily.....**EMPIRE MILL**—a few shares sold at \$165, closing at \$170.

**AMADOR**—sold in the open board, early in the week, at \$215 huyer 30, then at \$200 seller 30. We quote it at \$215 asked. At the present end of the north drift, on the 1,210-foot level, 200 feet from the shaft, the ledge is ten feet wide. The holder ledge that came in is now six feet wide, and the rock is said to be improving in quality, and is becoming more regular. The main ledge, together with this holder formation, is fourteen feet wide.

**CONFIDENCE**—at the close a few shares sold at \$40. From July to the close of September the average yield per ton fell from \$19 51 to \$14 60. The receipts of hullion during October amounted to \$12,000; in September, \$11,310. The annual meeting of the stockholders takes place on Friday, the 8th inst.....**BEIUCHER** commanded \$108@115, closing at \$102 50.....**ALPHA** changed hands to a limited extent at \$450 seller 30.....**BULLION** realized \$16@14.....**JUSTICE AND INDEPENDENT**, \$12 25@11 50; and **ESCHQUER**, \$7 50.

The aggregate sales of Stocks, Legal Tender Notes, etc., at the regular sessions of the Board since Saturday last, amounted to \$1,067,419. The sales in the open session, from the 25th to the 1st November, inclusive, amounted to \$405,572, showing a combined aggregate to date during the past week of \$1,472,991.

**STEAM FLOUR MILL**—Santa Barbara is going to have her own flour mill. The machinery is now being manufactured in this city.

**WOONWARR'S GARDENS**—It will be seen from the advertisement which appears to-day, that new attractions are being continually added to the variety heretofore presented.

MINING SHAREHOLDERS' DIRECTORY.

(Compiled for every issue, from advertisements in the MINING AND SCIENTIFIC PRESS and other San Francisco Journals.)

Comprising the Names of Companies, District or County of Location; Amount and date of Assessment; Date of Meeting; Day of Delinquency; and Amount and Time of Payment of Dividends.

Table with columns: NAME, LOCATION, AMOUNT, AND DATE OF ASSESSMENT, DAY OF DELINQUENCY, DAY OF PAYMENT OF DIVIDENDS. Lists various mining companies and their financial details.

Table with columns: Item, Price. Lists various goods like Butter, Cheese, Eggs, etc. with their respective prices.

San Francisco Metal Market.

Table with columns: Item, Price. Lists various metals and alloys like Iron, Steel, Copper, etc. with their market prices.

Valuable Books on Mining, Mineralogy, Geology, Metallurgy, Etc.

Table listing various books with columns: Title, Author, Price. Includes titles like 'ANSTED'S Gold Seekers Manual', 'ANTISELL', 'BLAKE, W. P.—Geological Reconnaissance', etc.

AN INSTRUCTIVE BOOK!

Prof. LAYRES' ELEMENTS OF COMPOSITION, BELLES-LETTRES AND ORATORY

For Scholars, Teachers, Lawyers all Professional Persons, and those of Common Education, who would improve the Eloquence and Effectiveness of their Composition and Manners of Address.

Price, postage paid, \$1.10. This is a new publication, and in style and treatment of this important subject, is original, simple, plain and comprehensive. The author, Prof. LAYRES (a meritorious Teacher of good standing in California, and a sound thinker and reasoner), in his preface says: "The method pursued by the Author in developing the subject of Composition, is both the synthetical and analytical. The former is necessary to teach the theory, the latter the practice of the art; and as these are both indispensable to the scholar, so are also the two methods, as the sequel will show."

Latest Stock Prices Bid and Asked.

Table with columns: Stock Name, Bid, Asked. Lists various stocks like United States 7-10ths Bonds, California State Bonds, etc.

BEAN'S HISTORY AND DIRECTORY OF NEVADA COUNTY, CALIFORNIA.

Containing a complete History of the County, with Sketches of the various Towns and Mining Camps, the Names and Occupation of Residents; also, full Statistics of Mining and all other Industrial Resources.

THE GOLDEN ERA.

Founded in 1852, it is the oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family journal of unequalled excellence.

DEWEY & Co., Mining and Scientific Press Office, San Francisco.

Mineral Land Law Blanks FOR SALE. We are prepared to furnish any of the following blanks used in securing patents for lands under the National Mineral Land Act of 1866: I. Applicants' Declaratory Statement. II. Diagram, Description of Diagram and Boundaries, and Notice. III. Register's Order for Publication—with Notice. IV. Deposition that Notice has been Posted. V. Application for Survey Etc.

DEWEY & Co., Mining and Scientific Press Office, San Francisco.

Mineral Land Law Blanks FOR SALE. We are prepared to furnish any of the following blanks used in securing patents for lands under the National Mineral Land Act of 1866: I. Applicants' Declaratory Statement. II. Diagram, Description of Diagram and Boundaries, and Notice. III. Register's Order for Publication—with Notice. IV. Deposition that Notice has been Posted. V. Application for Survey Etc.

RECOMMENDATIONS:

It is simple, concise, and well arranged. It seems to be a work of great value.—John Smith. I am prepared to concur in the recommendation of the Honorable Superintendent of Public Instruction.—J. C. Pelton. After a careful and thorough perusal of the same as it was in my power to give, I came to the conclusion that, for conciseness, correctness, and precision of definition, as well as for completeness and simplicity of style, it was, and would be, without a rival. I regard your work as the best of its kind. I know of but few men in any profession who would not be benefited by its careful study.—Wm. H. Hill. I regard it as one of the best treatises upon these important branches—perhaps the only one obtainable possessing equal advantages—combining comprehensiveness with conciseness, and of such simplicity in its arrangement as to be readily understood by the advanced pupil.—F. W. Hatch. It is admirably arranged to develop the correct idea of the analysis and synthesis of language, and the application of ideas into sentences and periods. The style is clear, terse and pleasing. I do not hesitate to recommend it as a great acquisition to our text books.—James Denman. I am happy to express my conviction of the value of the whole treatise. It would give me much gratification to see so thorough and excellent a treatise emanate from young California.—Martin Kellogg. I recommend it to all those who wish to obtain a book that will give them definite ideas on this subject, and teach them to express their thoughts and feelings in a clear, simple, and forcible manner.—Caroline L. Atwood. I regard the book about to be published as far superior to any work extant upon that subject.—Wm. S. Hunt, A. M. I believe the work will be a valuable and much needed addition to our school text-books.—Herman Perry. You have brought the results of a profound analysis, and made them available, in a practical form.—I. H. Brayton. I am recommended particularly to my young friends of the legal profession, as a source from which they may be able to learn much of value as special pleaders and as advocates at the forum.—John Curry. The subjects upon which you treat have heretofore been too much neglected in the education of young men in America. Exactly calculated to interest. It will soon become a necessity in every lawyer's library.—Charles A. Tuttle. Its clearness and comprehensiveness make it easy.—G. W. Boies. A gentleman of varied learning and ripe culture, who has half a dozen languages at his tongue's end. He seeks to teach the student not only how to take sentences apart, but how to construct them. His system has the merit of originality. We know of no work in which can be obtained so lucid an exposition of the elements of composition, and such valuable assistance in learning how to put his ideas into language. Prof. Layres has done the cause of popular education good service.—S. F. Bulletin. This is a San Francisco book by a San Francisco author. It contains 66 pages, and is altogether creditable to a San Francisco. It meets a public want, and meets it in a form and size cheap and convenient, and in reach of the humblest.—Alto California. The writer, the lawyer, the minister, or the statesman, may study its rules and definitions with profit. Nothing conduces more to the purity of a national literary taste than a general and thorough knowledge of the rules by which the construction of language is governed.—S. F. Times. Prof. Layres plunges at once "in medias res." He seizes a sentence (which is the unit in composition, whether written or spoken) holds it up before you; tears it to pieces before your eyes; or rather, he shows you, neatly and skillfully dissects it—displays one by one its several parts; makes you thoroughly acquainted with each, in its integrity; and then shows you how to put them together again. A series of such experiments, if system has the merit of originality, gradually that you do not feel the difficulty, and the thing is done; you are master of the subject.—Mining and Scientific Press.

San Francisco Market Rates.

Table with columns: Item, Price. Lists various commodities like Flour, Corn Meal, Wheat, etc. with their market rates.

Wholesale Prices.

Table with columns: Item, Price. Lists various commodities like Flour, Corn Meal, Wheat, etc. with their wholesale prices.

Three copies one year, \$12.00. Five copies one year, 18.00. Ten copies one year, 35.00. An extra copy free for one year to the person sending a club of ten subscribers. Send money to our office in registered letter, or by Express, Address, BROOKS & CAPP, San Francisco.

## Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

## CALIFORNIA.

## Alpine County.

*Miner*, Oct. 26th; Mr. Graff recently made an assay of a sample of the ore lately struck in the Merrimac mine, which gave a return of \$200.87 per ton, \$18 of which was gold, the balance silver. The ore is also rich in copper, being what is known as Fahlerz or gray copper ore; called also fahlors. For over 80 ft. along the tunnel this ore has been found, and its quality improves as distance from atmospheric influence is attained. Yesterday, and the day before, much better specimens than the one assayed were found in large quantities.

Several Washoe experts and others who have visited the Mountain tunnel recently, give it as their opinion that they are near their ledge. The granite composing the face is now much of it bleached and full of sulphurets, supposed to be the result of infiltration from a body of ore at no great distance ahead.

Messrs. J. Morris and Wm. Monahan have this week entered into a written agreement with E. Arnold, Supt., to run 300 ft. of tunnel for the Leviathan Co. whose claim is situated about four miles northerly from Monitor.

There has been another strike in the I. X. L. mine. What extent the body found will prove we have not even an idea, but our informant says he saw a chunk weighing over 30 lbs. of as good ore as was ever found even in this rich vein.

The Ringold Co. are putting track in their tunnel and have a car ready to run, which will greatly facilitate the work. They are in ledge matter yet, but not in far enough to expect the good thing promised by the croppings.

## Amador County.

*Dispatch*, Oct. 29th; The McAdams & Hubbard mine near Middle Bar of the Mokelumne river is to be reopened.

Last week, Mr. Thomas Brady sold his interest, one-fourth, in the Kennedy mine to Mr. B. F. Langford, of Woodbridge, for \$10,000. The ore yields from \$28 to \$54 per ton.

The improvements at the Coney & Bigelow mine are being pushed forward vigorously. They have a large force of men at work on the timbers for the new steam hoisting works, which are to be of a very substantial character.

## Calaveras County.

*Chronicle*, Oct. 26th: Three and a half tons of unsorted rock taken from Lamphear & Co's lead, near Spring Gulch, crushed at Harris' mill, paid \$11½ per ton. The lead is wide, well defined, and prospects well from top to bottom.

The quartz claim of Alexander, Seavers & Co., situated in Rich Gulch, is paying handsomely. Their mill has a battery of 10 stamps, which is run by water. The claim had been worked considerably previous to falling into the hands of the present owners, but owing to defective machinery and consequent loss of gold, it did not pay and was abandoned. We understand that since the present company has been working the mine, about four months, it has paid all expenses and the company have \$6,000 in bank.

Messrs. Hill & Homer have leased the celebrated Whisky Slide claim, having purchased the Mina Rica mill at West Point, and will immediately remove it to Whisky Slide.

## Inyo County.

*Virginia Enterprise*, Oct. 29th: The following is an extract from a letter written by Charley Duval, now in Cerro Gordo Dist., Inyo county. A number of furnaces are in full blast in Cerro Gordo, and a considerable amount of silver is being taken out. The Mexicans have made many improvements in their furnaces and in their smelting processes, and the hullion now turned out by them sells readily at \$1 per oz., at the mines. The St. Lucas mine, two miles from Cerro Gordo, is being worked by Messrs. Ochoa and Almada, who are taking out about a ton and a half of ore per 12 hours, working two men. This ore yields, by mill process, \$300 per ton. It is being worked at the Silver Sprout mill. Mr. Duval, in speaking of a visit to Kearsarge Dist., dwells at considerable length upon the management of the Kearsarge mine and mill by J. B. Low, and thinks that he will soon bring Kearsarge out with flying colors.

## Mariposa County.

*Mail*, Oct. 26th: The splendid new mill of Robinson & Co., was started a few days since, and promises to be productive of great results to the owners and to the community. The mill runs three batteries of

four stamps each, driven by an engine of 50-horse power, to which is attached the patent "cut-off," and Scott & Eckart's Regulator. It is claimed for this invention that it will work a saving of 33½ per cent. of fuel. The mill is in all its parts regarded as one of the most perfect that has ever been put up in this county. The vein is five ft. wide, and possesses excellent facilities for working. The incline shaft cuts the vein at 165 ft. There was about 90 ft. of water in the mine; but the new pump and pumping machinery is reducing it very rapidly—at the rate when first started of about 20 in. per hour. The mill is in active operation, with 175 tons of ore to work upon, which will yield \$20 per ton.

## Nevada County.

*Transcript*, Oct. 25th: About a year ago a 5-stamp water-power mill was erected on the Grizzly mine, at Devil's Cañon, and for the last several runs the rock has yielded about \$100 per day. Recently 10 more stamps have been added, and a 40-horse engine purchased by Mr. Clark, which will be put up on the mine immediately. The ledge has been thoroughly prospected for a distance of 2,500 ft., and found to be of average richness, varying in thickness from three to six feet. The casing is well defined, and the lode gives evidence of being a true ledge. A new tunnel has been run 80 feet below the lower level, and the ledge reached, giving 400 ft. of backs. Mr. Clark now proposes to run another tunnel which, in 500 feet, will cut the ledge, thus opening the mine for the whole 2,500 feet, and giving from 500 to 800 feet backs.

Oct. 26th: Rock was taken from a prospect shaft in the Enterprise mine, at Diamond Creek, last fall, which paid \$24 to the ton in free gold, and the sulphurets, by the chlorine process, yielded \$510 per ton. The owners of the claim are now engaged in opening it.

There are now six quartz mills and two arastras running in the vicinity of Eureka. Two more arastras and a mill are soon to be built.

A 5-stamp mill, run by a "hurdy-gurdy" wheel, has been erected at the Marietta mine at Devil's Knob, and is kept constantly at work upon rock which pays from \$15 to \$20 per ton. They are now taking out rock from a 5½-foot shoot which yields \$20 per ton, without working the sulphurets. One man taking out rock keeps the mill running day and night. The total cost of mining and milling the rock is only \$3 per ton. The Marietta has been opened by two tunnels on the ledge. The upper one is in 60 feet, and the lower 120 feet. These tunnels are run directly upon the ledge, and the lower one now has 100 feet backs, which increases as it is driven in.

The Mary Etta mine was located by Spring & Co., at Diamond Creek, about a year ago, and lately sold to Jas. E. Perkins for a San Francisco company, which has a working capital of \$50,000, in cash. The machinery for a 20-horse engine to be erected upon this claim is now on the road, and a 5-stamp mill, which can be increased to ten if necessary, is to be erected immediately.

*Transcript*, Oct. 30th: The Scandinavian Co. which was recently incorporated, design to erect an 8-stamp mill upon the claim. The ledge has been prospected for 300 feet, and is demonstrated to be rich.

*Gazette*, Oct. 28th: A rich quartz vein was struck last Saturday, on Cement Hill, by Henry Richards and others. They were running a tunnel for gravel, when they struck the ledge crossing the tunnel.

From a pan of quartz taken from the Sinnott ledge last Friday \$150 was obtained. The vein is small, but the quartz is of the finest quality, being literally filled with gold.

*National*, Oct. 24th: The Empire Co., on Ophir Hill, cleaned up on Tuesday \$26,500, after a run of less than a month.

*Excelsior*.—Meadow Lake *Sun*, Oct. 26th: We were shown yesterday by Mr. Chappell, superintendent of the Mohawk and Montreal mine, some 70 ozs. of amalgam, valued at about \$1,200. This was from 54 tons of rock.

The Live Oak Co. have reached a depth of 38 feet on their ledge, which looks finely, showing a considerable quantity of free gold.

The Camp Co. have closed their mine for the winter.

The Eclipse Co. are engaged in packing ore from their mine to the Mohawk and Montreal Co's mill for crushing.

*Virginia Enterprise*, Oct. 29th: At Collins' hat store, yesterday, we were shown a handsome golden brick just received from the Mohawk and Montreal mine, which looked fully as interesting as those which have preceded it. It was assayed by G. W. Dorwin, assayer of this city, and its weight was 65.50 ozs., containing gold \$1,025.56, silver \$16.93—total value, \$1,042.52. This was the product of 54 tons of sulphuret ore which was thought to contain but little free

gold, averaging over \$20 per ton, independent of the sulphurets, which are carefully saved for future treatment. There is plenty of ore on hand, but the mill is only run occasionally, the energies of the company being principally directed to the building of ore shoots and other outside arrangements, preparatory to a steady winter's run.

The Meadow Lake correspondent of the *Gold Hill News* writes, Oct. 22d: "The Green Emigrant Co. have reached a depth of 40 feet, and struck a well defined ledge six feet wide. Their average yield, in free gold, is over \$30 per ton, exclusive of the sulphurets, which assay over \$100.

The Grant Co. are driving their work night and day. Fine developments are constantly being made. The company now employ a large force upon their mine.

The Gold Run is an A No. 1 mine. Their tunnel follows the ledge into the mountain about 230 feet. A better defined ledge cannot be found, the ore showing a great amount of free gold.

The Eclipse is one of the richest prospecting claims yet opened. They are making preparations to ship about 100 tons to the Mohawk mill to be crushed, which will, no doubt, make a good yield.

## Placer County.

*Dutch Flat Enquirer*, Oct. 26th: The Iowa Hill correspondent writes: "The Pacific Co. is still at work opening their ground and will begin to 'breathe' about New Year's. We were informed that the Columbus Co. had within their mine a hand cement mill, which excited our curiosity so much that we concluded to see it. When we reached there we were exceedingly surprised at the simplicity of the machine. It is simply a sort of trip-hammer concern, and it is astonishing the rapidity the cement yields to the blows, and the richness of the cement is just about as astonishing. Gold could be seen in every piece you might pick up. At the Shelly Co's dumps we saw a monstrous hill of pay dirt waiting for water. A little further up we saw Keffe opening the old Baltimore tunnel for the purpose of working old ground. Still above, and we found Davidson and Wilson carrying out first rate looking dirt from their new tunnel. The old Live Oak Co. are vigorously driving their tunnel ahead, expecting to strike the lead every day.

*Herald*, Oct. 20th: McGonigle & Co. have struck it richer than ever in the Black Ledge. Capt. Mallett has also found some very rich quartz in his claim, west of North Ravine, which is supposed to be on the same vein as the Peter Walter ledge.

## Plumas County.

*Quincy National*, Oct. 26th: The Green Mountain ledge, in Cherokee District, owned by Batchelder & Kettis, has been lately yielding large returns. The rock is hauled two miles to a 4-stamp mill, in Dixie Cañon, where it is crushed, paying on an average of nearly \$100 per day. The last clean up, for 21 days' run, yielded upwards of \$2,000.

Operations have been commenced in the new quartz mill of H. C. Bidwell, near Greenville. This mill will be used to crush rock from the Caledonia ledge, which is believed to be quite rich.

## Shasta County.

*Courier*, Oct. 26th: The owners of the Bullion ledge are so elated with their fine prospects that they have decided to erect a mill for reducing the ore.

Ed. Baldwin and Ike Downing have struck a rich prospect on Rock creek, and are busily engaged in opening their claim and preparing for the rainy season. The gold found in this claim is of a coarse character, and is found principally on the bed rock. A nugget weighing three ounces was found in an adjoining claim last winter.

Taylor & Daniels have purchased the Salt creek water ditch, and contemplate extending it to a point not far from the Bunker Hill claim, where they have struck diggings which prospects almost as rich as the celebrated Daniels claim.

## Sierra County.

*Downieville Messenger*, Oct. 26th: The Comet-Gravel Co., near Grass Flat, is now reaping the reward of over ten years' steady work in tunneling, it having recently taken out nearly \$600 in the space of eight sets of timbers in the main tunnel. The tunnel is now in about 2,000 feet, and the heading is yet a long distance from the point which this company intends to reach. Still better pay is expected when it strikes the main channel.

The Mount Pleasant Co. intends to consolidate with the Washington and Ladies companies, and run a joint sluice from Cañon creek, a distance of 1,500 feet, by which they will drain nearly one mile front, at an estimated cost of \$30,000, opening as extensive and rich as the famous Blue Gravel mines at Smartsville, Yuba county.

The Star Co., at Greenwood, near Cedar Grove, adjoining the Caledonia Co's ground,

are taking out rich dirt, paying from \$8 to \$12 per day to the pick, and are driving their main tunnel toward the summit, some 3,000 feet away, and expect when they reach it to strike the ancient river channel running from Howland Flat to Scales' Diggings, along the dividing ridge between Slate and Cañon creeks.

Considerable excitement has resulted from the discovery of rich ore in the Wehe quartz ledge, situated on the East Fork, about one and one-half miles from town. A solid ledge of micaceous quartz has been discovered, fully three feet wide, carrying a heavy vein of arsenical sulphurets, which it is estimated will yield thousands of dollars to the ton. We have specimens of the ore which show considerable free gold, one peculiarity of which is that it is nearly all crystallized.

Developments in the Brush creek mine shows that its richness borders on the marvelous. The shaft has been steadily going down since the date of the discovery of the rich pay streak, and there is still no diminution in the richness of the rock. Breasting on the ledge both ways from the bottom of the shaft shows the rock to be equal to that taken out at the start. The owners select the best ore, barrel it up, and store it away in a safe place.

Some time since several hundred pounds of rock from the Good Hope mine were taken to San Francisco for the purpose of getting a working test. The ore was worked by Messrs. Clements and Peters, and one lot of 47 pounds taken from the main shaft, averaged \$46 per ton. Another lot of 37 pounds taken from the mouth of the tunnel, gave \$34 per ton.

## Tulare County.

*Visalia Delta*, Oct. 23d: Sage Land, near Kelson Cañon, is likely to prove one of the richest mining camps yet discovered in this portion of the State. The first mill was built there a few weeks since, by Messrs. F. White Taylor, of Havilah, and Walker, of Watsonville. In 60 days from the time the machinery left San Francisco, the mill was running, and the first six days' run, upon mere croppings, cleaned up \$5,000. Other lodes of equal richness abound in the vicinity, two more mills are going up and a few months will see a new town springing up in the wilderness.

## Yuba County.

*Marysville Appeal*, Oct. 29th: The Brown's Valley correspondent writes the following concerning the Rattlesnake mine: I will state that the ledge, in the north level, No. 2, is at present from 15 to 20 inches wide and the quartz very good; and that at the top of this ledge is a small streak of quartz about 12 inches in width, which is exceedingly rich. This rich streak may be traced upwards for about 50 feet; but I have so far no means of knowing anything about its length northerly, or its extent downwards. The quartz in the south level, No. 2, is in nature and color similar to that in north level, No. 2, but as yet not so good.

## BRITISH COLUMBIA.

*Cariboo Sentinel*, Sept. 3d: The unprecedented dryness of the weather lately has had the effect of drying up the various streams to such a degree that mining has been almost totally suspended.

Several Chinese companies are working over old ground with water obtained from the Flume Co's ditch, and are making very good Chinese wages.

The only claims on Williams Creek that took out pay last week was the Aurora Co., which took out 127 ozs.; Raby claim, 60 ozs., and the Morning Star claim, which is yielding \$12 per day to the hand.

Notwithstanding the scarcity of water, the following amounts were taken out of Stout's Gulch during the week. Alturas Co. 175 ozs.; Taftvale Co. 132 ozs.; and Jenkins Co. 40 ozs.

Prospecting is being vigorously prosecuted in Red Gulch.

The Minnehaha Co. in Mosquito Gulch, who have gained no little notoriety lately, in consequence of their diggings being haunted by a ghost, have at last got on the lead. From the bottom of their new shaft they washed out yesterday forenoon eight ozs. The Hocking Co. washed out 35 ozs. for the week.

The Calaveras claim on Lowhee Creek, yielded during the week 100 ozs.

Sept. 12th: On Mosquito Creek the following companies took out for last week the following amounts: Minnehaha Co. 1½ ozs.; Ophir or Job Co. 12 ozs.; Hocking Co. 1½ ozs.; Willow Co. 20 ozs.; Point Co. 10 ozs.; Discovery Co. 20 ozs.; Holman Co. 20 ozs.; Jeffree Co. 60 ozs.

The Discovery Co. at Cedar Creek, are making \$20 per day to the hand. Aurora Co. took out during the week 100 ozs.

Sept. 16th: Stout's Gulch continues to give a good account of itself.

The Alturas Co. cleaned up for the week,

208 ozs.; Taftvale Co. 160 ozs.; Mucho Oro Co. 40 ozs.; Jenkine Co. is making about wages.

On Lowhee Creek, the Calaveras Co. washed out for four days' work last week 100 ozs.; First Chance Co. cleaned up for the week, 55 ozs. The old claims in the head of the creek have nearly all fallen into the hands of Chinamen, from whom it is next to impossible to ascertain the amounts taken out.

Sept. 23d: On William's Creek, the Aurora Co. washed out for the week ending yesterday 440 ozs.; Borealis Co. took out for two days' washing, 20 ozs.; Raby Co. had about 70 ozs. for the week; Hibernia Co. are making \$8 and \$10 a day to the hand.

Moorhead Co., on Lowhee Creek, now owned by six Chinamen, are making \$50 a week to the hand; Chittenden Co. are averaging \$15 a day to the hand; Plumbago Co. are starting a drift into the hill above the former company's lines; First Chance Co. had about 50 ozs. for the week; Calaveras Co. washed up for the week 100 ozs.

Oct. 12th: The Taftvale Co., in Stout's Gulch, found a nugget weighing 5½ ozs., entirely free from quartz.

Oct. 26th: On Cedar Creek, the Aurora Co. last week had their sluices robbed of about \$500 in dust. They continue to take out about \$20 a day to the hand. The Discovery Co. are also taking out about the same amount.

#### COLORADO.

Denver News, Oct. 16th: At the First National Bank, there was this morning, nine silver bricks, weighing 250 lbs. The bricks are from ore from the United States Coin lode, and was reduced at the reduction works of Garrott, Martine & Co.

From eleven assays of ore from the Herkimer lode, the lowest yielded \$200, silver, per ton, and the highest \$2,800. The average of the 11 assays was \$953.64 per ton. Another assay from picked specimens yielded \$5,300 per ton; 580 ozs. run in the Georgetown smelting furnace, yielded 180 ozs. of pure silver, valued at \$241.20, or at the rate of \$964.80 per ton.

A bar of bullion is on exhibition at the Fair which weighs 226 80-100 ozs. fineness .831½, and valued at \$5,600. The bar is from Colorado Gulch gold, taken out by Dr. Burt.

A rich free gold bearing lode has been discovered in California Gulch. It is called the Five-Twenty lode.

Times, Oct. 15th: A company has been formed in the East, with a capital of \$120,000, to work the Crescent and Nyanza lodes, near Georgetown.

Twenty-four ozs. of silver were lately taken from six lbs. of picked ore from the W. B. Astor lode.

W. P. Linn has sold one-half of the Mexican to parties East for \$25,000. The same company are negotiating for the other half.

The Nuckolls, that was thrown up by Chicago men on account of the crevice narrowing, has been sunk to a further depth of 10 ft. by Mr. Packard, the enterprising owner. It now looks better. The ore is very rich, and there is no doubt but what it will make a good mine.

The New Boston lode is one of the strongest argentiferous galena veins near Georgetown. There is 2½ to 3 ft. of solid ore in the crevice, that assays from \$80 to \$140 per ton. Nearly 150 tons have been brought to the surface.

The largest percentage of gold and silver yet saved by the "California process," was obtained yesterday from four tons of Gregory ore. Its value per assay was \$50 per ton, and the parcel yielded, after treatment, \$182.08, being 91 per cent. of the assay.

About 20 men are working on the bar diggings below Idaho, and are making good wages. Now and then come very rich streaks of pay dirt are found.

Mr. Peter Fleming, of Nevada, has struck a very rich dirt crevice on the American Flag lode. There is four ft. of it, and every particle will wash four hits to the pan. It is thought to be the Burroughs or the Kansas putting into the Flag.

A lode containing quantities of native gold has been struck up Soda Creek, one mile from Idaho. The owner is making money by running a very primitive kind of an arrastra.

Belden, Tennal & Co., who have been sinking for some time on the Leavenworth lode, have come upon one of the finest ledges of argentiferous galena yet discovered in this country.

Fifteen tons of ore, from the United States Coin, treated lately at Georgetown, yielded 86½ per cent. of the amount of gold and silver given by fire assay.

The Beverly mill at Nevada, is working on surface ore from the Newland lode, a late discovery in the neighborhood. It is full of native gold, some places presenting

a beautiful appearance. They expect to clean up over \$700 for the week's work.

The prospects of the Smith & Parmelee Co. never looked better. They are now working on one of the richest veins of ore ever discovered in this country. It is on their second level, from which they are now back-stopping upwards in a scientific manner, and with splendid results. Specimens from the ore that came recently in sight have been shown us—they assay \$400 to the ton. This ore is being laid aside to be worked by a more improved process. Their mill is now running on "stuff" taken from near the wall rocks, and from which they are realizing from 80 to 90 ozs. per week. They have besides nearly 1,500 tons of valuable tailings, which it is proposed to work by the California process.

Georgetown Miner, Oct. 10th: Mr. Snyder, agent of a Philadelphia company, at Mill City, is running Albion ore, by arrastra, from which he obtains \$200 per cord.

We have seen some very rich ore from the Belmont No. 2, East Argentine, that assays 1,200 ozs. of silver per ton.

C. W. Bramel, Esq., has just shown us a certificate of assay of ore from the Correct lode, made by Mr. Foster, that gave \$536.36 in silver per ton.

Recent assays of average ore from the Flora McLain lode gave \$495.44 and \$1,770.75 per ton.

Dr. Johnson, Supt. of the smelting works, is making arrangements for a pair of immense Cornish rollers, 17 to 28 in., capable of crushing from 75 to 80 tons of ore per day.

#### IDAHO.

Owyhee Aralanche, Oct. 19th: The Iowa Co's mill in Flint District started yesterday on a preliminary trial. Everything works well and the Co. look forward to the time when they will turn out "much bullion."

#### MONTANA.

Post, Oct. 12th: The Atlantic Cahle lode is the richest and largest auriferous quartz vein in Montana. Some doubts were entertained at first as to the immense deposit of ore being a regular vein, but since well defined wall rocks, the lower a pure white granite, the upper a firm limestone, were found, these doubts have vanished and a bona fide ledge shows itself. The quartz is of every hue and texture, from pure white, thickly studded with fine gold, to eider-like hunt masses of decomposed rock variegated with sulphurets and oxides of copper, similar to the Dakota lode in Beaverhead county. The whole vein of quartz is intersected with crevices, which widen out into pockets in places, filled with decomposed quartz and dirt. The assay of average quartz, 1,200 tons of which lie ready to go to the mill, as tested by Bohm & Molitor, of Helena, is \$427.87 in gold and \$1.56 in silver to the ton.

The building for Hendry & Ray's 12-stamp mill at Butte City has been commenced, and the mill will be in operation in two or three weeks. We have the authority of gentlemen competent to give a reliable opinion, that the copper ores in that region exceed in richness those of the famous Lake Superior region.

Sheriff Snider on Tuesday resold the Co-re property in Alder Gulch, the purchase of which by Mr. Morse for \$6,500 was noticed some days since. Mr. Morse having a trust deed for the property, the sale to him was invalid. It was purchased at the last sale by Mr. Leroy Southmayde for \$6,800 currency.

Mr. Postlewaite is about to commence the erection of a 15-stamp mill to crush ore from the Kennett lode. It will be erected near Slade's ranch on the Madison divide, and work will be commenced in a few days.

#### NEVADA.

##### Black Rock.

Sage Brush, Oct. 19th: Black Rock is still fomenting. Quite a number of interested spectators are drifting by to the immediate vicinity of that famous region, and many of our own citizens will go thither to remain for the winter. Owing to the peculiar climate of that section the winter is the best season for operating there.

Maryeville Appeal, Oct. 25th: There is an increased excitement about the Black Rock mines. They are fabulously rich, but the working of the rock has been attended with obstacles which seemed to be beyond the power of science and the perseverance of man to overcome. Lately, however, several tons of rock have been worked at the Dall mill, Nevada, with results which seem to give confidence to capitalists and induce the erection of two mills.

##### Humboldt.

Unionville Register, Oct. 19th: Some 20 assays of ore from the Bueva Vista series of ledges, in Battle Mountain district, taken without selection, have been made, the lowest of which gave \$50 per ton, ranging up into the hundreds. The ore is decomposed,

and in appearance resembles the best of the Golconda ore.

The Dun Glen correspondent writes: There are several hundred tons of first class rock lying on the dump at the Cumberland mine.

South of the Cumberland is the Register mine, on the same belt of mineral. This claim looks very favorable, and the owners have made arrangements to open it immediately.

The Jefferson is also considered a first-class mine. A shaft of 40 feet has been sunk on it. The ledge is over six feet wide, and the mineral taken from the vein looks very rich.

The Black Hawk has the appearance of a first-class mine. There has been but little work done upon it as yet.

The Kentucky mine has all the qualities of a good vein of mineral, the croppings being very rich in silver.

Thousands of tons of mineral are in sight in the Golconda mine that will pay from \$60 to \$100 per ton. The ore is being daily hauled to their mill in Fairview.

Oct. 26th: Mr. Ginaca will have his new 10-stamp quartz mill finished and in running order in the course of three weeks. This mill will be run by water power.

The Humboldt Canal Co. has nearly completed its canal, and it appears to be a perfect success.

Trespass, Oct. 25th: Two of the five large pans used for calcining at the Onana smelting works have broken with recent use, and will have to be replaced at great cost. It is believed that the pans were cast too large and of too light material to stand the weight of so much metal as they are charged with. They will be immediately replaced.

##### Pahranaगत.

San Bernardino Guardian, Oct. 19th: We have heard from Pahranaगत district this week, and are glad to hear that, after all, there is a good show for these mines coming out. A party from there reports that a sale of large interests in Pahranaगत has taken place in New York, the stamps on the transfer deed amounting to \$3,000. It is reported that operations will at once be commenced, and conducted in the most thorough manner; that the mining will be conducted by practical and experienced men, and that by next spring the camp will open up as one of the most lively and enterprising in the whole country. There will be no want of capital to develop the resources of the lodes, which are claimed to be the continuation of the great Comstock.

##### Reese River.

Reveille, Oct. 21st: The Knickerhocker mill was set in motion last week. It is reducing ore from the Columbus district. Several mines at Ione belonging to the mill company were producing good ore.

The 10-stamp mill of the Consolidation Co., of Hot Creek, which has been idle for months, has been leased by Judge Ferris, and is at present employed in working its own tailings successfully.

The vein of the Quintera ledge, in Silver Bend district, was cut in the shaft at the depth of 130 ft., and was found to be of the width of seven feet. Drifts extend from 50 to 60 ft. on either side of the shaft, in which there are bodies of ore that will pay at the rate of \$80 to \$100 per ton. A trifle over three feet in the width of the ledge carries the main body of ore. The surface ore of the Quintera was as rich as any yet discovered in the district.

Since the purchase of the Northumberland mine, in the district of that name, by T. P. White, for his company, active measures have been taken to open it. The most important work yet undertaken is the running of a tunnel on the eastern slope of the mountains, which, according to survey, will strike the ledge in the length of 360 feet at the depth of 140 feet below the surface. The first 30 feet were easy going, and were made at the rate of 12 feet per day. Next spring another tunnel will be commenced on the western slope of the mountain, which is estimated to be 1,300 feet long when the ledge shall be cut, and 500 feet below the surface.

Oct. 23d: Since the starting of the mill by the Old Dominion Co. life and activity have been infused throughout Hot Creek district. The Old Dominion mine continues to improve in appearance, although it is opened to only a slight depth, and it is producing a large amount of excellent ore. Other mines in Hot Creek are doing equally well. Among the best of these is the Silver Glance, near the summit of the Blue Ridge mountain. The ledge has been traced for nearly 400 feet, and yields good ore in all the excavations. Its main opening is by an incline shaft which is scarcely 20 feet deep. The vein is five feet wide between the casings, three feet of which contain the mineral. Several tons were worked at the Old Dominion mill and gave a yield of \$100 per ton. It is the intention of the owners to

push work on the mine during the winter.

The Buckeye mine in Summit Cañon, North Twin River, has produced singular as well as valuable ore. Its samples of native silver, in flakes, spongy masses and delicate threads, are as common as they are beautiful, and are unequaled in the Reese River region. Ten tons of ore from the mine had been reduced at the mill of the Twin River Co., and the pulp assayed at the rate of \$300 silver per ton.

Oct. 24th: Joseph Williams, who lately discovered a number of gold and silver-bearing quartz ledges near the California houndry, has had 12 assays of the ore made by Boalt & Stetefeldt, three of which yielded as follows: No. 1, silver, \$183.26; No. 2, silver, \$91.62—gold, \$6.28; No. 3, gold, \$366.75—silver, \$5.52. All the rock contained gold from traces to \$10 per ton.

Reveille, Oct. 25th: The Murphy mine has improved greatly in appearance, and that the quality of the ore, which was always good, is still better. The work is being pushed through an extensive "chimney" of most valuable ore.

The Florida mine, of the New York and Austin Co., continues to produce regularly a fair quota of superior ore, the yield of which varies from \$250 to \$350 per ton. On the platform there were some 30 tons of first class ore, which will, in our judgment, rub the latter figures close. Large pieces of the ore showed the size of the vein to be from 12 to 14 inches thick.

The vertical shaft of the South American mine is 172 feet deep, and the lowest level extends from the depth of 160 feet. The vein is firm and from 10 to 18 inches thick. The quality of the ore produced is excellent. Ten tons of the ore as it was taken from the ledge were sent to the Manhattan mill for reduction, the yield of which was \$171 per ton. Thirty tons—10 tons of first-class and 20 tons of second-class—are now at the Met-tacom mill, but the yield of the ore has not been ascertained.

Oct. 26th: Bunker Hill district is beginning to awaken considerable attention. The success of Coover's fine mill, which is employed in reducing ore from the Victorine ledge, is perhaps the immediate cause. Several ledges have been sufficiently prospected and opened to determine the quality of their ore. Nearly all the mines in the district produce mineral which contains an appreciable quantity of gold, and several of them yield gold in excess of silver.

Nearly 4,000 ounces of bullion arrived in the city yesterday afternoon from Ione. It was produced at the Knickerhocker mill.

Silver Bend Reporter, Oct. 26th: A company has commenced work on a tunnel intended to strike the Red Warner and other ledges, with indication of reaching the Warner in a few days.

##### Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

Virginia Enterprise, Oct. 23d: Four tons of ore from Washington district is being worked at Dall's mill, which, it is expected, will yield \$300 per ton.

Oct. 24th: A movement is on foot for the resumption of work on the Union claim, Palmyra district.

The daily average of ore taken from the Gould & Curry mine at present is 100 tons, with from 3,500 to 4,000 tons already in the ore houses at the mine and mill.

A lot of 1,500 pounds of ore worked from the Dunderberg mine at a mill in Aurora yielded at the rate of \$50 per ton. The ore operated upon was not selected, but was taken out across the whole width of the lead.

Oct. 25th: The hoisting works at the new Ophir shaft are now in operation.

Wells, Fargo & Co. shipped from their offices in Gold Hill and Virginia during the past week, 6,184 pounds of assayed bullion, valued at \$159,254.13.

Oct. 26th: The Lady Bryan has at last proved a paying mine. Within the last six weeks it has been discovered that the whole of the immense croppings of the ledge are a mass of paying ore, which it is only necessary to blast out and send to the mills. A piece of ore selected as an average specimen by Mr. Sharon, of the Bank of California, assayed \$111.99, and a piece selected at the same time by Mr. O'Neale went \$169.85 per ton. A specimen submitted to contain nothing at all yielded at the rate of \$37.45 per ton. Assays made from the pulp flowing from a battery in which a lot of float rock was being crushed, yielded as follows: \$32.12, \$26.23 and \$31 per ton. In regard to these assays it must be borne in mind that quicksilver was used in the battery, and that the greater part of the free metal contained in the ore was doubtless amalgamated and held within the battery. The Golden Eagle mill, Dayton, is now running on ore from the Lady Bryan.

## Mining and Scientific Press.

W. B. EWER, SENIOR EDITOR.

O. W. M. SMITH, W. B. EWER, A. T. DEWEY,  
DEWEY & CO., Publishers.

OFFICE—No. 505 Clay street, corner of Sansome, 2d floor.

## Terms of Subscription:

One copy, per annum, in advance, \$5 00  
One copy, six months, in advance, 3 00  
For sale by Carriers and Newsdealers.

WRITERS should be cautious about addressing correspondence relating to the business or interests of a firm to an individual member thereof, whose absence at the time might cause delay.

POSTMASTERS are requested to punctually inform us of the removal of subscribers of the Press from their locality, or of neglect to take the paper out of the office from any cause—when the subscriber omits that duty himself. It is not our intention to send this journal to any party longer than it is desired. If we inadvertently do so, subscribers and others will please inform us.

## Canvassing Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. Jan. 11, 1866.

Dr. L. G. Yates is our duly authorized traveling agent. July 5, 1867.

Mr. A. B. Butler is a duly authorized traveling agent for this paper. July 15, 1867.

Mr. W. D. Root is an authorized agent for this paper for Nevada State, August 1, 1867.

Mr. H. C. Northrop, is our duly authorized agent for Oregon, Washington, Idaho, and Montana. Aug. 17.

## San Francisco:

Saturday Morning, Nov. 2, 1867.

## Notices to Correspondents.

**HISTORICUS.**—The only Englishman that ever wore the papal crown was Nicholas Breakspear, who was elected Pope in 1154. His piety, virtue and ability occasioned his elevation to that high office. He was the son of an obscure clerk, and had been rejected by the Abbot of St. Albans on account of incapacity. Stung by this disgrace and the reproaches of his father, he traveled to Paris, without resources other than the alms of the charitable. He studied with applause in the university of that city, and subsequently wandering into Provence was admitted amongst the regular canons of St. Rufus, who elected him, in succession, prior and abbot. In the latter capacity his insisting on strictly virtuous conduct, offended a large part of the fraternity over whom he presided, who combined in presenting to the Pope an accusation against him, and afterwards a second. In the interval the Pope had seen and conversed with Nicholas, and on the occasion of the second deputation waiting upon him, in order to lay before him their complaint, the Pope (Eugenius) with a smile, said: "Go elect another abbot—the Englishman is cardinal, Bishop of Albano." In this office he performed several important legislative functions, and on the day following the decease of Anastasius, the successor of Eugenius, the former wandering "poor scholar," as he would be called in Ireland, was by the conclave, without solicitation on his part, unanimously elected to the pontifical throne.

**PETROLOGIST.**—We are not able to state why the aluminous mineral Bauxite, alluded to in our issue of Oct. 5th, in the Scientific column, as being at present the most available material for the production of aluminum, was so called. From its title its properties are not in the slightest degree to be inferred; a fact, however, common to the greater part of mineralogical names. As an example of this barbarous method of naming minerals, we may mention those containing cerium, eighteen in number, only three of which are at all calculated to give the reader the remotest idea that cerium forms a component part of any. The following is the list of terms: Edwardsite and manazite (as phosphate of the protoxide, also in cyrtolite and phosphocerite,) cerite, allanite, orthite, pyrrhite, gadolinite, iescherite, mosandrite, polymignite, cuxanite, fergusouite, pyrochlorite, mikrolite, and lastly (be careful, reader, not to get lockjawed in attempting the pronunciation) tschewkinite!

**J. P. W. D., Point Arenas.**—The mineral which you send has no value. It consists merely of alumina, silice, iron and sulphur. The yellowish appearance, which you probably mistook for copper, is due to a combination of iron and sulphur.

**SANTA ANNA.**—A telegram of Oct. 30th, says that this old reprobate has been sentenced to death. He has petitioned the government for mercy.

## The Petroleum Fuel Question.

To obtain the greatest quantity of heat from the smallest quantity of fuel, is a problem which has long occupied the attention of practical men. In the endeavors to solve this problem, the chief efforts have been directed to the size and construction of the furnace, and the arrangement of the flues. The properties of the fuel employed, although they have been more or less taken into consideration, have never, until quite recently, commanded that attention which their importance deserves.

The ordinary process of generating heat, whether it be for domestic purposes, in a common stove, or in a furnace, with a boiler for making steam, implies the occasional addition of some kind of fuel, the combustion of which is effected through the agency of oxygen, obtained as one of the elements of atmospheric air. In obtaining oxygen from that source altogether, only one-fifth of the volume contributes to the development of heat, while the other four-fifths, which consists of nitrogen, has to be raised to a high degree of temperature, and expelled from the chimney, carrying off a large amount of heat, which is entirely lost to any purpose of utilization.

Combustion denotes the union of carbon, hydrogen and oxygen, in various proportions. One of the main points to be considered in economizing fuel, is to bring these elements together in just the proper proportions, and under the most favorable conditions for effecting their perfect combustion, or a complete union of the carbon and hydrogen with oxygen. We know, from the vast volume of smoke which escapes from our furnace flues and chimneys, that these materials combine to a very limited extent only, in ordinary practice. Especially is this the case where fuel is employed which contains a large amount of the hydro-carbons. This waste of bituminous fuels, especially, is exceedingly difficult to prevent, even with the most carefully constructed furnaces. One reason is the necessity of a frequent exposure of the furnace to a large current of air, necessitated by the periodical introduction of fuel. This usually leads to an opposite extreme—the throwing on of too much fuel, entailing a constant waste and variableness of temperature.

The modern application of steam to ocean navigation has also called for another most important desideratum—the necessity of a condensed fuel, which shall occupy the least possible room on our ocean going steamers, every available foot of space in which is valuable for freight purposes. And as the more condensed the fuel employed, the more difficult it is to effect a complete combustion, the greater the necessity for improvement in that direction.

It is more particularly in view of this last consideration that the recent efforts have been made to devise ways and means for the employment of petroleum, instead of coal, for making steam. All the early trials in this direction were negated from the imperfect combustion produced; so large an amount of carbon being lost as to render the use of petroleum altogether too expensive for practical use.

In the European experiments, the petroleum has been injected in the form of spray, either upon incandescent coals or upon tiles, or some similar substance, previously heated to such a temperature as to ignite the petroleum by contact—the heat being kept up, of course, by the burning of the oil itself. The large amount of atmospheric air required to effect a perfect combustion, under these conditions, has been found to produce such a depressing effect upon the temperature of the flame, as compared with that produced by the mixed vapor of steam and volatile hydro-carbons, as to greatly impair its usefulness; a large portion of the heat being really employed in heating up and driving off the immense volume of nitrogen, which it is necessary to force into the

furnace to obtain the requisite oxygen for combustion; and with all this a very imperfect combustion is effected, as is shown by the volumes of escaping smoke.

Profiting by this failure, two of our American inventors, operating upon opposite sides of the continent, and, unknown to each other, have sought their chief supply of oxygen from another element than air—water. Water furnishes a much larger proportion of oxygen than air, while both of its elements, it is said, are combustible. Four-fifths of the bulk of the atmosphere is incombustible; and the heat required to drive those four-fifths from the furnace is not probably greater than that required for the final decomposition of steam, which has been superheated by waste heat to obtain the equivalent of oxygen, otherwise required from the atmosphere. While the oxygen is so obtained in sufficient quantity to produce a perfect combustion of the excess of carbon, the hydrogen is set free at precisely the point of time and temperature to admit of its ready union with a new supply of atmospheric oxygen, which is accomplished with the generation of the most intense artificial heat known to man.

This is the philosophy of using steam in combination with heavy hydrocarbons—or our native petroleum oils; and it is upon the perfection of the mechanical appliances by which this is effected, that the relative merit of the inventions of Mr. Foote, of Boston, and Mr. White, of this city, consists.

Neither of these gentlemen have either discovered or applied any new principle. The utility of the use of water or steam in burning heavy hydro-carbons was first made known, or at least first practically developed, in England in the winter of 1832-3, and was patented and made known as "Rutter's Patent Process for Generating Heat." The facts connected with this invention or discovery will be found very interesting in connection with the recent experiments in the same direction.

Mr. Rutter was, at the time mentioned, manager of the gas works at Symington, in Hampshire, England. The residual coal tar from the manufacture of gas possessed then, as now, but little value, and efforts were made to employ it as fuel in connection with coke in the furnaces. Mr. R. soon found that he could not consume more than one-third of it—the balance escaping as smoke. Reasoning upon the matter, he soon came to the conclusion that the imperfect combustion arose from the lack of oxygen. His furnaces being so constructed that he could not conveniently add to the volume of his draught, it occurred to him that since water, by its decomposition, yields both oxygen and hydrogen, that fluid would, if decomposed in contact with the burning tar, not only furnish the excess of oxygen required; but in addition thereto, a large amount of hydrogen, which latter would of itself greatly aid the combustion. He at once instituted a series of careful, comparative experiments, the result of which was, that whereas, under the old system of burning the tar, from 50 to 60 gallons were required as a minimum supply of a single furnace, in connection with the coke, for twenty-four hours; with the use of water, as above indicated, eight to twelve gallons of tar was all that was required for the same length of time. Moreover, he found that the heat generated by the combustion of tar in the presence of the water, was far more intense than the heat when water was not used. The fact was so apparent that the excess of heat, and economy of fuel was due to the presence of water that he made it the subject of a patent.

At that time petroleum and coal oil were only known as a drug; while the supply of coal tar was quite too limited to give to the discovery any great commercial value. Hence, but little importance was attached to the discovery, and it appears to have been almost or quite forgotten, until recently resurrected as a new thing in this country. Its application to making steam, so far as the principle was concerned, was distinctly recognized by Mr. Rutter in his application. The patent was made to cover all "bituminous, oleaginous, resinous, waxy and fatty substances in a fluid state." Its use with water instead of steam, was a necessity growing out of the application to a furnace, when no steam boiler was convenient for employing steam.

The American patentees, of course, cannot pretend to claim the application of steam for the purpose specified, as that could not be made the subject of a patent; they simply seek protection for the mechanical appliances by which they accomplish that purpose.

## A Virginia Gold Mine—California Machinery.

We have been permitted to read a letter from Prof. C. S. Richardson, descriptive of the Vacluse gold mines near Spottsylvania, Virginia. This mine was formerly worked by an English company; but was abandoned about fifteen years ago, and of course had become filled with water, and the shafts and drifts very much damaged. The entire works and mine have now been put in order under the direction of Prof. Richardson. They have a 150-horse power engine, driving the pumps, and 30 stamps. At present they are saving the free gold by the use of blankets, copper plates, mercury cups and percussion tables. The tailings go to pile for subsequent treatment. They have just commenced working. The mine appears to have been opened to the depth of 150 feet. The ore is a decomposed quartz and talcose slate, yielding, by assay, from \$15 to \$16 per ton, of free gold—picked ore going to double that amount. The concentrated sulphurets pay about \$40 per ton, and comprise about 4½ to 6 per cent. of the entire bulk of the vein rock. There appears to be two or three veins, very easily worked, the entire cost of delivering the rock at the pit's mouth being \$1.50 to \$2 per ton. There is said to be an abundance of ore of a similar character in that immediate vicinity, and quite a rush is expected if these works prove successful. There are five mines already opened, and there is talk of commencing operations on others soon. The Eagle mines are also located about ten miles distant from this locality. The Professor adds: "There is great talk over in North Carolina, of the eminent success they are having with what they call the 'California machine.' What it is I do not know, only that it was brought from San Francisco, and that other machines of a like description are *en route* for other mines in the same State. One of the miners from there was down a fortnight ago and told our captain that they had now entirely overcome all the difficulties in getting the gold from the mundic."

We know of no machinery, now at work in the Atlantic States, which has been sent thither from this city; although the proprietors of the Union Foundry sent on a set of machinery for a mine in North Carolina about three weeks since. They are also in correspondence with other parties there in relation to furnishing machinery. The machinery now *en route* consists of a 20-stamp mill, arranged in four batteries. This mill has a discharge on all sides, and is fitted with Booth & Co's arrangement of copper plates. Four Brevort grinders—one for each battery—go with it. These pans are built very much after the manner of the Baux & Guind pan. The pulp passes from these pans into *lavaderos*—large tubs, eight feet in diameter by six feet deep, with stirrers. They work with a slow motion, the water and pulp flowing over the top, while the gold, sulphurets, etc., settle to the bottom.

**MINING IN NEW HAMPSHIRE.**—Prof. Fleury has recently furnished to the Lishon (N. H.) Journal a lengthy article on the comparative values of the mines in that section, and those in Canada East. From a close inspection of each locality, he is inclined to give the preference to the New Hampshire mines. He supposes that both localities are on the same mineral range. The method of mining, however, in Canada, he thinks decidedly ahead of that at Lisbon and Lyman. In the former locality the work is undertaken on a larger scale, with plenty of capital—the works, whether at the mines, mills or furnaces, are conducted in a more substantial manner. Yet there are no ores in Canada that will show a favorable comparison with either the Dodge or Moulton mines in New Hampshire. These mines yield gold, silver and copper. The latter metal is reduced to 40 or 50 per cent. matte.

A Word to the Wise.

The long winter nights are now coming on, when every person will have more or less spare time, and when those who are unemployed will seek either the bar-room, the saloon or the fireside of home to find amusement. In the first two cases that time will most surely be thrown away; in the latter, the insipid novel or enticing game, although they may serve to tickle the fancy and while away the hour, will leave no traces of good behind; but rather create an appetite for that which tends to enervate the entire mental system, and render it unfit for anything else.

The great want of our farmers and mechanics, is a paper containing information which will not only serve to interest but to instruct. Such a paper we offer in the MINING AND SCIENTIFIC PRESS. No other paper on the Pacific coast contains so great an amount of valuable information as the PRESS. From its pages the progress, not only of the Pacific coast, but in a measure the entire country, may be traced. It is an encyclopaedia of every day instruction to the workingman and the student. Give the children the paper; let them study it; perchance they may get an idea from its pages; one idea a week will soon amount to quite a small stock of information, from which the mind may branch out and gather new and enlarged ideas—such as will form a solid foundation for an immense structure. The same benefit will accrue to the older person, and the time which would otherwise go to waste, will be used to lay up knowledge that will often aid in the workshops, in the mines, and in every-day conversation.

Many a genius lies buried in little blacksmith and other shops, or on the farms and in the gulches of our wide-spread land. No man has any business to be stumbling along, working at anything, without making efforts to improve his condition and sphere of usefulness. All are behind the times unless they keep themselves posted with the important inventions in mechanics and discoveries in science. There should be no kind of reading more attractive, especially to the young man, than a scientific and mechanical journal. It may be the first stepping-stone which will lift him to eminence in his trade or profession; it certainly can never do him any manner of harm, and will never make him any poorer.

**PETROLEUM FUEL FOR LOCOMOTIVES.**—A locomotive was recently run on one of the Pennsylvania roads, for a considerable time, with oil instead of coal for fuel. The experiment was suspended only on account of the defectiveness of the mechanical appliances for the new fuel. With White's or Foote's burners, there would be no difficulty whatever. A later trial was made on the Hudson River Railroad; but in consequence of some blunder on the part of one of the operatives, the result was not as satisfactory as it might have been, although the indications were exceedingly favorable for a final success. An ordinary locomotive consumes, on an average, about one ton of coal in three hours, or its equivalent in wood. A vast saving in transportation of fuel will be made on the great continental road, in passing over those portions of the line destitute of wood or coal—a distance of about 800 miles—if oil is found an economical fuel for making steam. Experiments thus far tend to prove that a pound of oil will make as much steam as two pounds of coal.

**LAND ON THE SAN JOSE RAILROAD.**—Sixty-eight thousand dollars worth of land in the Pulgas Rancho, was sold on Thursday last at auction, in lots of from 17 to 214 acres, and at prices from \$77.50 to \$160 per acre. The total number of acres sold was about 600, being the portion of that ranch known as the Gamble tract, adjoining Menlo Park.

The New Fog Whistle, or Steam Gong.

While Mr. Parker, lighthouse keeper at the Farrallones, was in the Eastern States recently, he saw a newly invented steam fog whistle, which was attracting much attention in New York and other seaport cities. He was so favorably impressed with it, that he purchased the right to sell the patent on this coast, and brought one of the whistles with him on his return, which has been temporarily placed upon the Vulcan Foundry.

Its tones are very peculiar, something between that of the ordinary whistle and the Chinese gong, always supposing those two instruments to be of mammoth proportions. It lacks the shrillness of the whistle and the harshness of the gong. Its sounds are not at all unpleasant, even when the listener is quite near; and seem but a little louder when only one block distant, than they do two miles off. It is a double bell, the one being set at a slightly different pitch from the other. The difference is effected by making the upper one a little shorter than the lower one—it thus produces a musical harmony, composed of two tones, which, blending, form a third. The effect among the hills at a distance of two or three miles is really beautiful. It is there heard very much like the rolling swell of a huge organ. The whole atmosphere seems to hefill of the swelling sound.

This whistle has been heard as far to the east as the head of Oakland Slough, and at the Seventeen Mile House, on the San José Railroad, a point not less than seventeen miles in an air line from the Vulcan Foundry. It has also been distinctly heard by pilots on board ships outside of the Heads, where the sound is more like that of a big gong than of a steam whistle. It is said that with a full volume of steam, and under favorable circumstances, the sound of one of these whistles has reached thirty-five miles; in the trials at the East.

We have already said it is a double whistle. One is turned mouth downward, like the ordinary whistle, and the other mouth upwards. The steam is conveyed by a pipe passing through the center of the lower bell, into a circular disk between the mouths of the two bells, and is discharged simultaneously upward and downward, from two narrow circular orifices, corresponding to the lips of the two bells. The supply pipe, when less than 75 pounds of steam is used, must be three inches in diameter; with from 90 to 100 pounds of steam pressure, a 2½ inch pipe is sufficient. The weight of the bell is about 350 pounds.

This whistle is a new Yankee invention, and is just coming into use at the East, along the Atlantic seacoast, where it will take the place of fog trumpets and fog bells. If one should be placed upon the Farrallones, with sufficient steam, its droning wail would sweep through a circle fully sixty miles in diameter, and sea-going steamers and sailing vessels would be able to make the harbor in the heaviest fogs.

**PATENT SUIT—IMPORTANT TO MILLMEN.** Brodie et al. vs. The Ophir Silver Mining Company. This case, which was one for the infringement of a patent, was tried in the Circuit Court, before the Hon. Justice Field, about three months ago, and a judgment awarded last week in favor of the plaintiff for \$2,500 damages. An application for a new trial was made by Mr. C. McAllister on the 31st ult., and opposed by the defendant's counsel, the Hon. R. G. Buchanan. When the judge makes his decision we shall give at greater length further particulars relating to this suit.

**Brown's Filtering Heater.**—For preventing incrustation in Steam Boilers, purifies water from lime or any other impurity, saves fuel, saves the boiler, prevents explosions, and protects life and property. The cost of the Filter is soon saved in fuel and boiler-repairs alone. One is in operation at the San Francisco Foundry, Fremont street, where rights can be procured, or all needed information, on application, in person or by letter, to 514-17 AUSTIN A. WELLS, Agent.

Perry Davis' Vegetable Pain Killer.

This medicine has relieved more pain, and caused more real joy than any other one thing that can be named. It is a "balm for every wound." Our first physicians use and recommend its use; the apothecary finds it the first among the medicines called for, and the wholesale druggist considers it the leading article of his trade. All the dealers in medicine speak alike in its favor, and its reputation as a medicine of great merit and virtue is fully and permanently established, and it is the "Great Family Medicine of the Age." Prices, 25 cents, 50 cents, and \$1 per bottle.

Sold by all Druggists, Grocers and Medicine Dealer everywhere. 18v15-lm

LEWIS FALKENAU. HENRY G. HANKS.

 All Boilers guaranteed and tested by U. S. Boiler Inspector before sent out of the Shop, at Shop expense.  
 All kinds of Sheet Iron and Water Pipe, Coal Oil Stills, Wrought Iron Worms, etc., etc. Manufactured to Order.  
**Old Boilers Repaired**  
**D. CAMERON.**  
 6v12-1y

**A SUBTERRANEAN PASSAGE.**—A singular discovery was recently made in the placer mining of the Tiger Co., at Columbia, in Tuolumne county. The gravel in this claim has been washed to a depth of about eighty feet, and at the bottom is a stratum of metamorphic limestone or coarse marble, which is intersected by numerous crevices and water worn channels. By accident a stream of about 2,000 gallons per minute, of water was turned into the claim, and instead of filling up the deep excavation, as was expected, it forced its way into a deep subterranean channel, through which it ran as long as the stream poured into the claim. The outlet was discovered about six miles below, so that there must be a continuous communication, like a cave, all the way. This is another of the many wonders of California.

**STATISTICS OF RAIN.**—The State Surveyor General desires to obtain for his report this year, from those parts of the State where statistics have been kept, data of the amount of rain falling each month during the winter of 1866-67. It is the Surveyor's request that the information be forwarded as soon as possible to the address of J. F. Houghton, State Surveyor General, Sacramento.

**CINCINNATI** is ahead of New York, Philadelphia and all the great Eastern cities, in the taste exhibited in the art of landscape gardening.

**Superior Workmanship**  
 of Mr. LOCHHEAD, who has been in the business in San Francisco for the last fourteen years, and enjoys the reputation of having built ONE HUNDRED AND SEVENTEEN STEAM ENGINES.  
 Screw Propellers of all kinds, and Steam Boat Machinery generally, made to order, and warranted to give perfect satisfaction in every particular. 25v12-8m

**THE ASIATIC JEWS.**—It is an ordinance of the Rabbies, in many places among the Jews of Asia, that when a man built a house he must leave some part of it unfinished, as an emblem of the ruin of their holy city and temple. Though dwelling thousands of miles away, they always speak of Palestine as close at hand. Their hopes of again rebuilding the walls of Jerusalem are expressed with the greatest confidence, although the period for their liberation is thought to be still far in the future.

A DIAMOND in the rough state was found at Camden, Miss., during the war, but at the time was considered of no value. Since then it has been examined, and in the opinion of intelligent men it is worth \$50,000. It is in the possession of Dr. Tom Cotten, of Camden.

MEDICAL authorities have announced that not less than one-fifth of the entire population of the United States are afflicted with neuralgia in some form.

A FLORIDA editor predicts that that State will be the Italy of America. There is a strong tide of emigration in that direction.

COPPER FROM AUSTRALIA.—South Australia has exported \$25,000,000 in copper within the past ten years.

**Mechanical Drawings.**

Persons wishing Mechanical Drawings can obtain the services of competent draughtsmen, by applying to this office.

**Assayer and Chemist.**

A GENTLEMAN WELL VERSED IN ASSAYING AND Analytical Chemistry, is desirous of securing a position in some assaying establishment, or would take charge of the assaying and amalgamating department of either a gold or silver mine. Steady employment, rather than high wages, is desirable. The advertiser would take his own laboratory to the mine if desired. Proper references given. Inquire at this office.

M. S. WHITING, F. G. BERRY.

**WHITING & BERRY,**

No. 609 Sacramento street, two doors above Montgomery, SAN FRANCISCO.

**TEA, WINE AND SPIRIT MERCHANTS,**

IMPORTERS AND WHOLESALE DEALERS IN FINE Brands, Whiskies, Gins, Port, Sherry and Champagne Wines, Ale, Porter, Cider, Bitters, Cordials, Syrups, etc., for medicinal and family use, and suppliers to families, apothecaries, physicians, city and country dealers, hotels, clubs, etc. in large or small quantities.

Observe firm name on each cork and fac simile of signature on label. Trade mark registered.

This is the only exclusive Tea, Wine and Spirit Store on the Pacific coast. It is neither a saloon nor sample room (as no wines or spirits are allowed to be drunk on the premises); but a depot where selected Teas and Pure Wines and Spirits may be found, at wholesale and retail, for medicinal and family use. In this respect it is our aim to vie with Hininger & Co., of New York; Bligow & Davis, of London; and Cozzens & Co., of Washington, where every facility is offered to ladies, as well as to gentlemen, in making their own selections and purchases in quantities to suit. Our Treatise on Wines, Spirits and Teas may be had at our depot gratis, and will be mailed to consumers and dealers in the interior when requested.

**Piles! Piles! Piles!**

NOT PILES OF GOLD, NOR YET OF SILVER, SO much coveted by all men; but the BLEEDING, BLIND or EXTERNAL PILES, can be easily and speedily cured by the use of

**WOOD'S SUB-POSITORY.**

It is a preparation totally distinct from anything heretofore offered as a remedy for this painful and often fatal complaint. THE SUB-POSITORY is neither a pill, powder, wash or salve, and yet it has proved to be a certain Remedy for the Piles. Do not doubt this assertion, or delay testing the truth of it if you are troubled with the Piles—you will not be deceived in it.

Sold wholesale and retail by J. H. REDINGTON & CO., Nos. 416 and 418 Front street; GEO. GRISWOLD, corner 2d Mission and First streets; OLD FAMILY DRUG STORE, corner Mission and Second streets; UNITED STATES DRUG STORE, Bush street, between Montgomery and Kearny.

C. WOOD, Proprietor, No. 63 Tehama street, between First and Second.

**THE PACIFIC IRON WORKS,**

First & Fremont Sts., between Mission & Howard, San Francisco.

The proprietors of the above Works invite the attention of all parties interested to their greatly improved and unequalled facilities for manufacturing Steam Engines and Boilers, both Marine and Stationary, of any required size and pattern, Quartz Mills, Amalgamating, Pumping and Hoisting Machinery of the most approved construction. Flour, Saw, and Sugar Mills, Water Wheels, &c., &c. Our pattern list is most complete and extensive, embracing the late improvements in all classes of machinery adapted to use on this coast. We would call especial attention to the fact that we have secured the exclusive right of manufacture for the Pacific Coast of the celebrated Greene Engine, conceded to be the most economical and perfect working Engine now in use. We are also exclusive manufacturers of the celebrated

Bryan Battery, Varney's Amalgamators and Separators, Ryerson's Superheated Steam Amalgamators and Rotary Crushers, Stone Breakers, &c. Orders respectfully Solicited.

And all other Blanks, Blank Books, etc., required by Mining and other Corporations, kept on hand or printed to order on short notice, at moderate prices, at the office of the Mining and Scientific Press.

Important to Californians.—Many inventors have lately had their claims for Patents seriously (and in some cases fatally) delayed by the unqualification of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations. These discrepancies, although arising from the inexperience of honest agents, are none the less dangerous to applicants for patents, whose safest course is to trust their business with none but active and experienced solicitors. The Mining and Scientific Press Patent Agency has strictly complied with the regulations of the Department, and properly filed all necessary papers as Claim Agents.

**Paint Manufactory IN CALIFORNIA.**

**EPES & E. H. R. ELLERY**

Have the Patent Right for the Pacific Coast to manufacture and use

Ellery's Patent India Rubber Cement & Paint. It is for all exposed surfaces; impervious to wet; will not rot, peel, blister or crack in any climate. A superior Paint for brick, wood, cloth, metals, etc. successfully used in the Eastern States. The old tin roof of that large building, the New York Rice Mills, was in such bad condition it was about to be taken off ten years since. Instead, they put on the INDIA RUBBER CEMENT AND PAINT, making a good tight roof. A coat of India Rubber Paint every two years since keeps it in good condition. We can refer to many others. The Adams Lead Works use our Paint only.

NEW CLOTH ROOFS put on; copings and all seams cemented and saturated, then coated with the India Rubber Cement and Paint—the same as on the St. Nicholas Hotel at New York City, the City Buildings and many others, the roofs of all the horse and steam cars, decks of steamboats, etc., around New York—for eight dollars per one hundred square feet. NEW OR OLD TIN ROOFS cemented and painted with the India Rubber Cement and Paint guaranteed, at from one cent to two and a half cents per square foot, according to size and condition of roof. Good men and the best materials used.

We have just cemented and painted old tin roofs of Dr. H. D. Cogswell, Tibbs & Co., D. J. Oliver, etc., and the wood work of Sheriff Davis' building, 83 feet front on Folson street, between Third and Fourth streets, with our coat. The work will speak for itself. Now painting the cornice and iron work of Dr. H. D. Cogswell's building, corner of Front and Clark streets—one coat. See the above and further references at our office.

ELLERY'S PATENT INDIA RUBBER CEMENT AND PAINT is composed of India rubber and other gums, dissolved in linseed oil, mixed with the various coloring matters and ground in any color. When applied to roofs or other purposes it is mixed with pure linseed oil to the required thickness and put on as other paints are, with a light brush—retaining sufficient elasticity to give and take with the heat and cold. Fifteen hundred fishing vessels at Canc Ann use the India Rubber Paint, finding it superior to all others.

EPES & E. H. R. ELLERY are now prepared to make good roofs and cement and paint new or old ones, and do all kinds of outside painting with Ellery's Patent India Rubber Paint. No asphaltum or coal tar used. Office, No. 226 Jackson street, corner Battery, San Francisco, Cal.

Full assortment of DRUGGISTS' GLASSWARE and DRUGGISTS' SUNDRIES, ACIDS and CHEMICALS, can stand on hand. San Francisco Merch 6, 1865. 11v10-1f

To the People Of the Pacific States, And Especially those Engaged in Mining.

Gold is the attractive element which has brought more than half a million people to this coast. Every one who comes here wishes to have his share out of Nature's treasure box as quick as possible. The laws of the land are liberal. They say you are welcome to all the gold you can find or dig out, and it depends only on you to know or to learn how to do it. That our mines are rich beyond calculation, is plainly proven by the thirty millions of gold we annually produce, and which is still on the increase, in spite of the many failures and the imperfect mode of working, by which more than fifty per cent. of the precious metals is lost. The days of placer mining—where only physical strength was required—are gone, and we have now to resort to Practical Chemistry and Metallurgy to working the ores of our mines. Not every miner can be a Chemist and Metallurgist, as such an acquirement requires years of study; but what they want, and what pretty effectually meets the case, is a place where, in a few lessons, they can obtain a practical knowledge of how to treat certain classes of ore; and for this purpose, to make mining in the future more reliable, safe and profitable. With this end in view, I have endeavored to bring within the reach of every one the necessary practical knowledge of how to be successful in mining; and for this purpose I have now established the first and only Practical Metallurgical and Mining SCHOOL in the United States, where gentlemen can learn more in a few practical lessons than by years of book study without practice. I have also the only METALLURGICAL WORKS in California, where I undertake to assay and work ores of every description. Many eminent gentlemen have, within the past year, taken lessons at and from my establishment, and all of them will bear testimony that they were perfectly satisfied with the amount of information they obtained, and that it was so obtained in half the time they expected. For further particulars apply at my office, 323 Montgomery street, San Francisco. J. MOSHEIMER. 6v15-1f

MOSHEIMER'S PIONEER MINING SCHOOL AND Metallurgical Works.

Having established the first Practical Mining and Metallurgical School in the United States, I would call the attention of gentlemen who may wish to obtain a practical knowledge of Chemistry, Metallurgy, etc., to the fact that I am now prepared to teach the following branches: 1. Assaying of ores, metals and other mineral substances. 2. Technology, or Chemistry, as applied to any special branch of manufacturing. 3. Metallurgy of gold, silver, lead, copper, etc., by smelting, amalgamating, lixiviation, etc. 4. Gold extraction by chlorine gas; also, a modified process of the same, which is cheaper and quicker than the processes usually employed. 5. Concentration. Dressing of ores. 6. Construction of furnaces, in which any kind of fuel may be used for smelting, roasting, etc., as well as the erection of any machinery or apparatus required in metallurgy and technology. Mining is considered by many a very hazardous undertaking; but I can assure anyone that our mines are as safe an investment as any other business when properly understood and managed; therefore, learn first, if you have a mine, then study the nature of the ore, and how to work it, and you will never fail to be successful. It may be superfluous to state that I am theoretically and practically acquainted with all the branches I offer to teach. Years of actual experience in the laboratory, smelting works, quartz mills, and other manufacturing concerns on my own account, have not only given me lessons, but more than ordinary ability. I was the first person who successfully extracted silver by smelting, on a large scale, and have since been traveling through the manufacturing and mining towns of Europe, to study all improvements, and am now again the only one in San Francisco who undertakes to work any kind of ores by either roasting, smelting, lixiviation, or chlorination process. I also undertake the erection of smelting and roasting furnaces, and furnish plans and estimates for any kind of works. My lately invented Roasting Furnace has the following advantages: Furnace of the capacity to roast one to one and a half tons of ore per day can be built for \$300. It requires half a cord of wood per ton of sulphurates. The total expenses of roasting are not over 50. The roasting is more perfect, as the ore appears in a spongy condition and eagerly takes to the chlorine gas of quicksilver when amalgamated. A large size furnace in successful operation may be seen, by permission of Mr. Maltman, in his works in Nevada City. Several others are in progress of building. Charges for assaying gold or silver ores.....\$3 00 Copper ores..... 5 00 Practical Chemist, Metallurgist, etc. Office, No. 323 Montgomery street, San Francisco, Cal. 6v15-3m

Professional Cards.

SHERMAN DAY, Mining Engineer, No. 114 Montgomery Block, San Francisco, Will examine, survey and report upon mines, and consult and advise concerning investments in mining property, or the machinery management and expenditures of mines. 22q\*

FREDERICK MANSELL, Mechanical & Architectural Draughtsman, No. 422 California street, corner of Leidesdorff. Drawings of MONUMENTS made for parties applying for patents at Washington or London. mar23-1f

To Those Whose Interests We Represent.

While there is every reason for gratification at the circulation which this journal has already reached, we are yet well aware that there are great numbers of miners, mechanics and lovers of science to whom it might be made a source of much usefulness and profit.

New subscriptions will be received at all times by mail or otherwise. Those who have friends that they think might be interested or benefited by the paper, will confer a favor both upon them and us by calling their attention to this matter, and at the same time by so doing they will place us under still greater obligations to themselves, and enable us by its increased receipts, to add still more to the value of the paper.

We trust that it is needless to urge upon our readers the necessity of promptly renewing their subscriptions. The two indexes for volumes XII and XIII, which we have already published, and the 500 ample pages of reading matter, apart from advertisements, to say nothing of our numerous engravings and illustrations, speak more for the value which we give for the price of a year's subscription than we can say in this connection.

ENLARGEMENT

American Journal of Mining

Volume III, Commencing March 3.

In consequence of the remarkable success that has attended this Journal, the proprietors feel warranted in increasing its size to

Twenty Pages, Thus making it the LARGEST and most COMPREHENSIVE Mining Journal on this continent, representing the Gold, Silver, Copper, Iron, Lead, Coal, Slate, Oil, and in fact all the Mineral Interests of America, containing beautiful engravings, illustrating the latest improvements in milling, mining and metallurgical machinery.

The Journal has won the encomiums of the press of the entire country and Europe, and numbers among its contributors more eminent scientific men than any other weekly publication in America.

The reports of the markets in stocks, metals, minerals and ores, carefully corrected weekly, are an important feature of the Journal.

Subscriptions: \$4 per year; for six months, \$2.25—in advance; single copies, 10 cents. Specimen copies sent free.

Address, WESTERN & OCEANIC, 1416-lamby Publishers, 37 Park Row, N. Y.

New Mining Advertisements.

Whitman Gold and Silver Mining Company. Location of Works: Indian Springs District, Lyon County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the thirty-first day of October, 1887, an assessment of one dollar and fifty cents per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, at his office, (room No. 10, 2d floor) No. 402 Montgomery street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the second day of December, 1887, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-third day of December, 1887, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

B. CONGDON, at the office of the Company, 629 Washington street, San Francisco.

Any stock upon which said assessment shall remain unpaid on Tuesday, the fifth day of November, 1887, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the twenty-first day of November, 1887, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

H. B. CONGDON, Secretary. Office, No. 629 Washington street, (Room 5) San Francisco, Cal. oc5

The date fixed in the above notice of Assessment for the sale of delinquent stock, has been extended till Monday, December 2d, 1887, by order of the Board of Trustees, duly made and entered on the records of said Company.

H. B. CONGDON, Secretary. San Francisco, Cal., Oct. 15, 1887. oc19-14

Great Central Mining Company--Location of Works: Yuma County, Arizona Territory. Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the thirtieth day of September, 1887, an assessment of one dollar per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, No. 302 Montgomery street, or at the Pacific Bank.

Any stock upon which said assessment shall remain unpaid on the fourth (4th) day of November, 1887, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-fifth day of November, 1887, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

O. D. SQUIRE, Secretary. Office, No. 302 Montgomery street. oc5

George Washington Gold and Silver Mining Company--Location of Works: Silver Mountain District, Alpine County, Cal. Notice--There are delinquent, upon the following described stock, on account of assessment levied on the eleventh day of September, 1887, the several amounts set opposite the names of the respective shareholders as follows:

Table with columns: Names, No. Certificate, No. Shares, Amount. Lists shareholders like Altdorfer, Geo., Allison, John H., Berry, Geo. E., etc.

And in accordance with law, and an order of the Board of Trustees, made on the eleventh day of September, 1887, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by Giney & Co., auctioneers, 418 Montgomery street, San Francisco, Cal., on Monday, the fourth day of November, 1887, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

A. G. WOOD, Secretary. Office, 338 Montgomery street, San Francisco. oc19

Gold Hill Tunneling Gold and Silver Mining Company--Location: Gold Hill Mining District, County of Storey, State of Nevada. Notice--There are delinquent, upon the following described stock, on account of assessment (No. 9) levied on the nineteenth day of September, 1887, the several amounts set opposite the names of the respective shareholders, as follows:

Table with columns: Names, No. Certificate, No. Shares, Amount. Lists shareholders like C. L. Guyard, R. P. Galt, E. Villote, A. Vollet, etc.

And in accordance with law, and an order of the Board of Trustees, made on the nineteenth day of September, 1887, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by Messrs. Maurice Doré & Co., No. 327 Montgomery street, San Francisco, on Tuesday, the nineteenth day of November, 1887, at the hour of 10 o'clock, P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

R. WEGENER, Secretary. Office 415 Montgomery street, San Francisco, Cal. oc26

George Washington Gold and Silver Mining Company--Silver Mountain District, Alpine County, Cal. Notice--The Fifth Annual Meeting of the stockholders of the above named Company will be held at their office, No. 333 Montgomery street, San Francisco, Cal., on TUESDAY, the fifth day of November, 1887, at 7 1/2 o'clock P. M., for the purpose of electing Trustees to serve for the ensuing year, and for the transaction of such other business as may properly come before them.

A. G. WOOD, Secretary. San Francisco, October 10, 1887. oc12

Hope Gravel Mining Company--Location of Works and Property: Grass Valley, Nevada County, California. Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the thirtieth day of September, 1887, an assessment (No. 17) of one dollar per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, No. 533 Kearny street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the sixth day of November, 1887, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the fourteenth day of November, 1887, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

DAVID WILDER, Secretary. Office, No. 533 Kearny street, corner of Sacramento, San Francisco, California. oc5

I. X. L. Gold and Silver Mining Company--Location of Works: Silver Mountain District, Alpine County, Cal. Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-third day of September, 1887, an assessment of one dollar and fifty cents (\$1.50) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, Pioneer Hall, Montgomery street, near Jackson, San Francisco, or to John G. Slavin, at Silver Mountain, Nevada.

Any stock upon which said assessment shall remain unpaid on the twenty-eighth day of October, 1887, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the fourteenth day of November, 1887, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. CRGWINSHIELD, Secretary. Office, Pioneer Hall, Montgomery street, up stairs, San Francisco. sep23

Postponement--The day for deeming stock delinquent on the above assessment is hereby postponed until Monday, the fourth day of November, 1887, and the sale thereof until Thursday, the twenty-first day of November, 1887. By order of the Board of Trustees.

J. CROWNINGSHIELD, Secretary. oc26

Kelsey Gold and Silver Mining Company, El Dorado County, California. Notice--There are delinquent, upon the following described stock, on account of assessment levied on the twelfth day of September, 1887, the several amounts set opposite the names of the respective shareholders as follows:

Table with columns: Names, No. Certificate, No. Shares, Amount. Lists shareholders like Noble Lovely, Wm Scarles, Wm Gould, etc.

And in accordance with law, and an order of the Board of Trustees, made on the twelfth day of September, 1887, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the salesroom of Maurice Doré & Co., No. 327 Montgomery street, San Francisco, Cal., on Monday, the eleventh day of November, 1887, at the hour of 12 o'clock, M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

H. V. HERBERT, Secretary. Office, No. 405 California street, San Francisco. oc26

Lady Bell Copper Mining Company, Low Divide Mining District, Del Norte County, California. Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-fourth day of October, 1887, an assessment of fifteen cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, or to J. K. Johnson, at Crescent City.

Any stock upon which said assessment shall remain unpaid on the twenty-sixth day of November, 1887, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the sixteenth day of December, 1887, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

B. P. WILKINS, Secretary. Office, 618 Market street, San Francisco, Cal. oc26

Nuestra Señora de Guadalupe Silver Mining Company. Location of Works: Tayolita, San Dimas District, Durango, Mexico. Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-first day of October, 1887, an assessment (No. 2) of one dollar (\$1) per share was levied upon the assessable capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, E. J. PEIFFER, at the office, No. 210 Post street, or to the Treasurer, A. H. MELLMAN, at his office, No. 637 Washington street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the thirtieth day of November, 1887, shall be deemed delinquent and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-fifth day of December, 1887, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

E. J. PEIFFER, Secretary. Office, No. 210 Poststreet, San Francisco, Cal. oc26

North Star Gold and Silver Mining Company, Reese River Mining District, Lander County, Nevada. Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 19th day of September, 1887, an assessment of twenty dollars per share was levied upon the capital stock of said Company, payable immediately, to the Secretary, George H. Faulkner, No. 423 Front street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on Tuesday, the twenty-second day of October, 1887, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the eleventh day of November, 1887, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

GEORGE H. FAULKNER, Secretary. Office, 423 Front street, San Francisco, Cal. oc21

Postponement--The day for deeming stock delinquent on the above assessment is hereby postponed until Wednesday, the 2nd day of November, 1887, and the sale thereof until Saturday, the 7th day of December, 1887. By order of the Board of Trustees.

GEORGE H. FAULKNER, Secretary. oc28

Oxford Bots Tunnel and Mining Company, Esmeralda District and County, State of Nevada. Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the eleventh day of September, 1887, an assessment (No. 2) of fifty cents per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, or to the Superintendent at the mine.

Any stock upon which said assessment shall remain unpaid on the twenty-fifth day of October, 1887, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the eleventh day of November, 1887, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

GEO. H. PECK, Secretary. Office, 212 Clay street, San Francisco. oc14

Postponement--The day for deeming stock delinquent on the above assessment is hereby postponed until Thursday, the 15th day of November, 1887, and the sale thereof until Monday, the twenty-sixth day of November, 1887. By order of the Board of Trustees.

GEO. H. PECK, Secretary. oc26

Old Colony Silver Mining Company--Location of Works: Austin, Reese River, Nevada. Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-eighth day of September, 1887, an assessment of three (\$3) dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at his office, No. 523 Montgomery street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the second day of November, 1887, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-fifth day of November, 1887, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

HENRY O. HOWARD, Secretary. Office, 523 Montgomery street, San Francisco. oc5

Quail Hill Mlolog and Water Company--Location of Works: Quail Hill, Calaveras County, Cal. Notice--There are delinquent upon the following described stock, on account of assessment levied on the eighteenth day of September, 1887, the several amounts set opposite the names of the respective shareholders, as follows:

Table with columns: Names, No. Certificate, No. Shares, Amount. Lists shareholders like G. W. Beaver, A. E. Hill, etc.

And in accordance with law, and an order of the Board of Trustees, made on the eighteenth day of September, 1887, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by Messrs. Duncan & Co., auctioneers, at the office of the Company, room No. 10, second floor of No. 402 Montgomery street, San Francisco, on Monday, the eleventh day of November, 1887, at the hour of 2 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

T. W. COLBURN, Secretary. Office, room No. 10, second floor of No. 402 Montgomery street, San Francisco. oc26

Rattlesnake Gold and Silver Mining Company, Brown's Valley, Yuba County, California. Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the seventeenth day of October, 1887, an assessment of one dollar (\$1) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, 313 California street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the twenty-third day of November, 1887, shall be deemed delinquent and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the ninth day of December, 1887, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. G. H. L. L. Secretary. Office, 313 California street, San Francisco, Cal. oc19

GLNEY & Co., Auctioneers and Real Estate Agents, attend promptly to all business entrusted to their care in San Francisco and Oakland. Mining and other corporations will find Col. Olney well posted and thorough in transacting sales of delinquent stock. Office, on Broadway, Oakland, and No. 318 Montgomery street, San Francisco. no10

Postponements and Alterations--Secretaries are requested to give notice of postponements, or alterations which they may desire made in their advertisements at their earliest convenience. New advertisements should be sent in as early as possible.

Machinery.

VARNEY'S PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the greatest number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Mill men are invited to examine these pans and settlers for themselves, at the PACIFIC FOUNDRY, San Francisco.

Hunt's Double-Action Pump

Is cheap, durable, strong, and not liable to get out of order. Built and on hand at No. 28 Second street, and 108 Jessie street 14161st E. O. HUNT, Prop'r.

E. T. STEEN,

Commission Agent for the purchase and sale of

Engines, Boiler Castings,

AND ALL KINDS OF MACHINERY.

No. 537 Washington, and 532 Merchant st., San Francisco.

HAS FOR SALE

- One Engine, 6-Horse Power, \$140
One Engine with Boiler, 7-Horse, 600
One Engine, Link for Hoisting, 15-Horse, 800
Two Engines, Boilers, Port., 16-Horse, 1,200
One Engine, 40-Horse, 1,200
One Iron Battery of 4 Stamps, 500

Also, a great variety of

Boilers and Machinery,

CASTINGS OF ALL KINDS,

AT LESS THAN MARKET RATES.

Parties wishing to purchase or sell Machinery, of any kind, can do so to advantage through this agency, 12v15qr

Steam Pumps,

FOR DRAINING MINES OR ELEVATING WATER TO ANY HEIGHT.

PICKERING'S GOVERNORS

For Steam Engines.

Giffard's Injectors,

For Feeding Boilers.

STODDART'S IRON WORKS,

Beale Street, San Francisco, 23v12 3u

PATTINSON'S

HURDY-GURDY WATER-WHEEL.

The inventor of this Wheel having, after much delay, finally obtained the patent for the same, is prepared to sell rights therefor to such as may be desirous of putting them up, or continuing those already in use. This is well known among miners as the "hardy-gurdy wheel," and is considered the most economical Water-Wheel now in use.

Notice is hereby given, that the subscriber is the inventor and holds the patent right for the construction and use of the same; and that no person has a right to manufacture or use them without his permit. 7v15-qy THOMAS PATTINSON.

Brodie's Patented Improvements

FOR THE TREATMENT OF

Gold and Silver Ores.

BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER.

The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Splitting Quartz, or other Rocks, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms:

- No. 1—Or 0-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price—\$800
No. 2—Or 15-inch Crusher, capable of similarly putting through five to six tons per hour—850
No. 3—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour—1,200

The frame is made of cast iron, bound with heavy wrought iron bands, making it very strong, and at the same time light and portable. The crusher is bolted to a wood frame of sufficient height to clear the fly-wheel, and allow the crushed quartz to pass off. The dotted lines show the movable and stationary jaws. Letter A represents the eccentric shaft by which the power is applied direct to the movable jaw. B represents the movable jaw, and C the fixed jaw. D represents the link or radius bar. E represents the bolts for regulating the opening. F, which can be regulated at pleasure, so as to graduate the size to which it is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designated.

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, D, gives the movable jaw, B, a forward and downward motion at the same time, and which makes the hardest rock yield and separate into fragments of any desired size. The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Rawhide Ranch, Tuolumne county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Fulton Foundry, First street, San Francisco.

The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Rawhide Ranch" Mine, in Tuolumne county. RAWHIDE RANCH, Tuolumne Co., Sept. 28, 1866. JAMES BRODIE, Esq., San Francisco—My Dear Sir: It gives me pleasure to inform you that I have for the past three months had one of your largest sized Rock Crushers in use, at the Rawhide Ranch Mining Company's Mill, which has entirely met my expectations; and I have no hesitation in recommending it to all who are in need of a machine for rapidly, cheaply and properly preparing quartz for the stamps. Yours truly, R. P. JOHNSON, Supt. Rawhide Ranch Quartz Mill.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.

Those infringing the patent rights to the above Improved Barrel, are hereby informed that on and after the 1st of November, 1866, the royalty charged for using the same will be fixed to the sum of \$100 per Barrel.

A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1866.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—This Dry Crusher has been found the most economical and effective mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations afforded on application to the subscribers. A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1866.

BRODIE & RADCLIFFE, Express Building, 402 Montgomery street, San Francisco. 12v13tf

LEFFEL'S American Double Turbine

THESE WHEELS, UNEQUALLED AND UNRIVALED IN THE UNITED STATES or the world, have been fully tested on this coast, more than forty being in use at this date in California and Oregon, driving all kinds of machinery, Saw Mills, Flour Mills, Quartz Mills, etc., etc., etc.

CALIFORNIA REFERENCES.—E. Steaton, Folsom; O. Simons, Oakland, (Mill at Clear Lake); Morgan Coyville, Lexington, Santa Clara County; J. Y. McMillan, Lexington Santa Clara County. Send for Circular to KNAPP & GRANT, Agents for California. 26v13-1yq 310 Washington street, San Francisco.

E. O. HUNT,

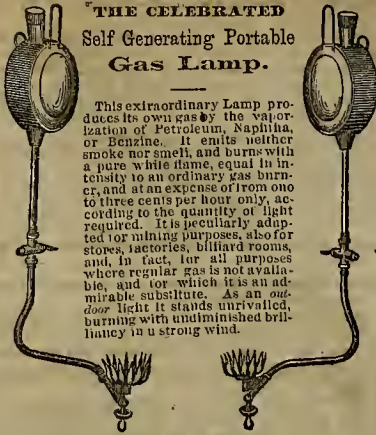

Manufacturer of

Windmills, Horse-Powers, Pumps, Pumping Frames and Gearing.

HUNT'S ADJUSTABLE WIND MILLS to have all the sails so arranged as to give way to the wind when the mill is stopped. These can be set at any angle to suit the force of the wind, while the mill is running, by means of the brake lever at the foot of the mill, by any person. HUNT'S SELF REGULATING MILL is strong, durable and cheap. It is provided with means for stopping, in the most violent winds. This mill is well known throughout the State.

Tread Horse-Powers, Swap Horse-Powers, Pumps in great variety, Single and Double Acting. Frames and Gearing for running pumps, from steam or other power, constantly on hand and built to order. Water Tanks built to order. No. 23 Second St., and 108 and 110 Jessie St. 2v15qy San Francisco.

THE CELEBRATED Self Generating Portable Gas Lamp.

Directions for Use.

Charge the reservoir with the prepared fluid, or with Benzine, from half to three-fourths full; allow a portion to run through into the cup, then turn off the tap and ignite the fluid, which will heat the burner sufficiently to generate the gas, which will be seen issuing from the top. The tap must now be turned on, and a steady light will be maintained till the whole of the contents of the reservoir is consumed.

A small needle, bent at the point and fixed in a holder, may be occasionally required to clear the minute hole through which the gas issues, and the regulating screw at the bottom turned a little back; but care must be taken not to force the screw too high, and it should never be used to extinguish the light—by turning the top off, it will gradually go out.

When necessary to renew the cotton which is placed in the lower pipe to prevent the too rapid flow of the fluid, the lamp should be placed in a vise and the burner screwed off. The burnt cotton must then be withdrawn, and a fresh piece of stout cotton rag, one inch wide and four or five inches long, should be doubled over a piece of wire, and inserted into the pipe—the ends cut short off, the burner again screwed on with a little white lead, and the lamp is ready for use.

Manufactured solely by JOHN J. HUGGS, original proprietor, Factory North Beach, San Francisco; and for sale by his agents in every city and town throughout the State. 18v14-3m-8

STEWART'S

CELEBRATED HINGED

Grinder and Amalgamator.

The Cheapest and Quickest Pan now used.

It is flat-bottomed, loses far less power in throwing the pulp, and eliminates the same under the muller to better advantage than any other Pan in use, while the steam, owing to the thinness of the cone, has a more direct effect in heating the pulp. E is the muller plate; F the Grinding Shoe, attached by an adjustable hinge joint in the middle of the same—the bottom wearing down even with the dies. Mr. J. H. STEWART, the inventor, has had ten years of experience in mechanics, and may be addressed at San Francisco, or called on at the Miners' Foundry, First street, where his Pan is manufactured, and is to be seen at any time in operation. 14v15-lamtf

SUPERIOR CUT-OFF ENGINES.

We desire to call the attention of Engineers, Manufacturers, and Millmen, to the celebrated

Hartford Engine,

With Wright's Patent Variable Cut-off, which we are now manufacturing under a license from the Woodruff & Beach Iron Work Co., Hartford, Ct. To parties wishing a First-class

Fuel-Saving Engine,

Simple and durable in construction, this Engine is offered in the belief that it is superior to any other manufactured. It enjoys the very highest reputation in the Atlantic States, where it is well known; over 300 of them having been built by the Woodruff & Beach Company, and being now in successful operation. GODDARD & CO., Pacific Iron Works, 3v16tt San Francisco, Aug. 29, 1867.

DR. BEERS' PATENT WIRE GAUZE AMALGAMATOR.

THE ATTENTION OF QUARTZ, HYDRAULIC AND Pincer Miners, is called to this new invention for saving Fine Gold. It is designed to furnish the miner with a cheap and simple apparatus by which the finest free gold can be saved without loss, requiring little attention, no machinery to drive it, and will positively collect every particle of amalgam, or of waste mercury that may have escaped from mill or sluice, and as these particles are always charged with more or less gold, this item alone, in many instances, will more than pay the cost of this Amalgamator every month. For Circulars, and further particulars, address Dr. J. B. BEERS, San Francisco, Per Wells, Fargo & Co's Express. 11v15-6m

BLAKE'S QUARTZ BREAKER!

A New "Iron Horse"—Wonderful, if True.

A new and wonderful iron horse has been privately exhibited at the recent Paris Exposition. The throng, during the regular hours of exhibition, would not admit of a public trial; it was therefore exhibited privately, at night, in the presence of the Emperor and a large number of invited mechanical engineers, inventors, etc. The Chicago Tribune gives the following account of this reported wonderful invention, from a private letter shown to the editors of that paper. We extract a portion, only, of the Tribune's account:

"The iron horse bears no resemblance to its equine namesake. Imagine a trunk-shaped box about seven feet long, and wide enough for a man to saddle, and about five feet high; the whole concern mounted on five wheels, the wheels concealed, however, under the machine. It is covered with leather, and has a saddle, only the saddle is very high in front and back, so there is no chance of being unhorsed. In front is a steering apparatus of the simplest kind—two silk cords—and just before the saddle is a steel bar, which regulates the speed. If you pull it up you start the machine; pull it higher up, you increase the speed; if you depress it, you decrease it until a point is reached, when the apparatus stops.

"The inventor, quite a young man, commenced winding up the machine with what seemed to me to be a crank motion, and as I distinctly heard the click of the ratchet, I therefore supposed it was worked by a coiled spring, but I have reasons since to think I was mistaken. I suppose it took two minutes to wind it, when he mounted it, and started it by pulling up the steel bar. It moved gradually off, so that for the first minute I could walk alongside of it; but presently it started at the speed of a fast horse, and in a moment more was lost, going round the curve of a circle, measuring some yards more than an English mile. It seemed to me to be incredible that he should have performed the circuit in two minutes and twelve seconds. A hearty clapping of hands greeted the machine as it came careering on, and gradually stopping without any apparent trouble.

"I noticed the Emperor, generally taciturn, loud in his applause, clapping his hands as lustily as I did. The inventor then said that he would put it up to its speed, but to do this he must give the machine a start. He then wheeled round, and just like a jockey starting a horse, got it up to a maximum; and as he passed us he seemed to be flying. The circuit was made in fifty-eight seconds. A new salvo of applause met him as he brought the machine to where the Emperor was standing, and I must say that I felt some just emotion when the Emperor took the legion of honor from his button-hole and placed it on the young inventor's breast."

The writer characterizes the performance of this machine as "extraordinary." He was informed that its highest rate of speed could be kept up for four hours. He thinks the mechanical power connected with it must be secondary, and that a galvanic battery, concealed in its interior, was its real motive power. The Emperor and the inventor are the only two human beings who know the secret of its mechanism. It is said that one of these motors is to be connected with a battery of the Emperor's newly invented artillery, elsewhere noticed in our present issue.

The writer saw four persons mount it, with whom it moved much more rapidly than a carriage could be driven. Experiments were made to show its capability of moving over a rough country. Several loads of earth were thrown over the floor, over which the machine passed with apparent ease.

The machine had been on exhibition, in a retired part of the Exposition building, from the opening of the same; but was sent away the next morning after the above trial, by order of the Secretary of War. The inventor's name is given as Victor de Nardea. This is either a great humbug, or a very important invention. It is decidedly Frenchy.

The receipts of the Alameda County Agricultural Society are reported about \$4,000, and the expenditures of the Fair about the same, leaving as a profit the property on race grounds, etc. The encouragement given this year will lead to greater efforts for a large Fair the coming year.

MINING SUMMARY—WASHOE.—Continued from Page 279:

A considerable body of pay ore was exposed by the recent cave in the Chollar-Potosi mine. It comes up to within a short distance of the surface.

Oct. 27th: Steele & Co. are still engaged in extracting ore from the Sacramento mine of a quality that pays well for crushing.

The Savago mine is now yielding an average of 320 tons of ore per day.

Brooks' mill, Washington District, is in operation. We learn that eight tons of second-class ore from the Eclipse mine worked at the mill yielded 100 pounds of amalgam.

There is a rumor that a strike has been made in the Hale & Norcross mine.

Gold Hill News, Oct. 28th: Palmyra District is beginning to loom up again. There are four or five companies now at work. Some ore has already been sent to one of the mills at Dayton, which yielded over \$40 per ton.

UTAH.

Salt Lake Vedette, Oct. 19th: There is an exhibition in Walter's jewelry window an enormous piece of gold quartz weighing some 50 pounds, and literally "lousy" with gold. We were informed it had just arrived from the California Mining District, Sweetwater, and was taken from the "Miners' Delight" ledge.

THE DISCOVERY OF THE LAWS OF GRAVITATION.—A claim has been lately set up in France to show that Pascal was the original discoverer of the laws of gravitation. This claim was based upon some correspondence, said to be in the handwriting of Pascal, produced by M. Chasles before the Academy of Sciences. The correspondence was pronounced in the English journals to be a forgery, and the same opinion is also entertained by many eminent Frenchmen, among them M. Fongere, who some years ago spent fifteen months in deciphering the manuscripts of Pascal's "Pensées," and who says that the forger has not even imitated Pascal's handwriting. The glory of Newton seems still untarnished.

SANTA CLARA COLLEGE, S. J. SANTA CLARA, CAL.

Conducted by the Fathers of the Society of Jesus.

The SEVENTEENTH ANNUAL SESSION of this College will commence on August 23, 1887.

TERMS—Tuition in the Classical and Scientific Department, Boarding and Lodging, Washing and Mending of Articles Washed, School Stationery, Medical Attendance and Medicines, Fuel, Light, Baths, etc. per session of ten months, \$350.

For further information and catalogues, apply to the President of the College, or to Rev. A. Maraschi, St. Ignace's College, Market street, San Francisco.

5vt3-1m REV. A. MASNATA, S. J., President.

THE CENTRAL PARK OF THE PACIFIC.

Woodward's Gardens, ART GALLERY,

MUSEUM, GYMNASIUM, AND ZOOLOGICAL GARDENS.

A GRAND INSTRUMENTAL CONCERT every Saturday afternoon, and on Sundays a GRAND CONCERT OF SAUREO MUSIC, appropriate to the occasion.

THESE BEAUTIFUL GARDENS ARE VISITED DAILY by hundreds of the pleasure-seeking public, and all agree in pronouncing them the best and only first-class suburban resort on the Pacific Coast.

The extensive grounds are covered with the rarest trees and shrubbery, making it a most desirable spot for small parties wishing to enjoy a Pic-Nic.

To all departments new attractions are being constantly added. These Gardens are accessible by the Howard and Market street Cars.

Entrances on Mission and Valencia streets, between Thirtieth and Fourteenth, OPEN EVERY DAY, admission to all parts, 25 CENTS. Children, under 12 years, half price. 10v15ar

FARMERS' AND MECHANICS' BANK OF SAVINGS.

225 Sansome street, near California.

Incorporated under the Act of the Legislature of California, approved April 11th, 1852.

CAPITAL STOCK, \$150,000.

DIRECTORS:

N. O. Fassett, George M. Condee, Reuben Morton, O. H. Wheeler, Isaac E. Davis, James Laidley, Henry Dutton, B. H. Freeman, Samuel L. Palmer, G. H. WHEELER, Cashier, N. O. FASSETT, President.

Deposits received in gold, silver or currency, payable in like kind, at sight. Funds may be sent by express, or in registered packages by mail. Receipts will be promptly furnished.

We will receive Gold Dust and Bullion, for refining or assay, make advances on the same, and return proceeds promptly.

Best Bankers' Drafts, on all parts of the world, furnished at lowest rates, by addressing us. Write names plain. Checks of all banks taken.

Money loaned only on first-class security, safety being our first consideration.

The Highest Rates of Interest paid on Gold Deposits.

DEPOSITS RECEIVED IN SUMS OF \$1 AND UPWARDS. We will keep safely all bonds deposited with us; collect and remit the interest to our friends in the country, as may be directed. For further particulars, address FARMERS' AND MECHANICS' BANK, 2v15-6mew

Quartz Mill Construction and Superintendence

THE UNDERSIGNED IS AT PRESENT OPEN FOR AN engagement as Superintendent in the construction or operation of a quartz mill. Has had five years steady and successful experience in working ores in Washoe, and is practiced in saving sulphurets and the treatment of rebellious ores. Is prepared to furnish references for all the necessary qualifications of an intelligent, faithful and reliable quartz operator. Address F. M. SHAW, San Francisco, care Mining and Scientific Press. 26v143m

Mining Secretary.

THE SUBSCRIBER, HAVING SERVED FOR THE LAST five years as Secretary of various mining companies, feels fully competent to serve in that capacity. Any parties wishing to secure the services of a Secretary can be accommodated on reasonable terms. Information given, and all necessary papers correctly made out.

Having had a long experience in the purchasing of goods and machinery for miners, parties in the mines will find it to their advantage, where purchasing agents are employed, to send their orders to the undersigned.

J. M. BUFFINGTON, No. 5 Government House, San Francisco. 17v15tt

Copperas! Copperas! 75,000 LBS. IMPORTED COPPERAS-SULPHATE of Iron—for sale in lots to suit, by BENJ. BRADY, 103 California street, S. W. corner Davis, up stairs. 13.15-3m

PACIFIC Insurance Company, SAN FRANCISCO, CAL., Office, No. 422 California Street. CASH ASSETS, JULY 1, 1867, \$1,238,054 91. FIRE, OCEAN, MARINE, INLAND INSURANCE.

**IN THE PROBATE COURT OF THE CITY AND COUNTY** of San Francisco, State of California.—In the matter of the Estate of **HENRY GANAHL**, deceased. Order to show cause why Order of Sale of Real Estate should not be made. It appearing to the said Court by the petition this day presented and filed by Andrew D. Smith, the Administrator of the Estate of Henry Ganahl, deceased, praying for an order of sale of real estate, that it is necessary to sell the whole of the real estate to pay the debts, expenses and charges of the administration of said estate. It is therefore ordered by the said Court, that all persons interested in the estate of said deceased, appear before the said Probate Court on **MONDAY, the eighteenth day of November, A. D. 1867,** at ten o'clock in the forenoon of said day, at the Court Room of said Probate Court, at the City Hall, in the City and County of San Francisco, to show cause why an order should not be granted to the said Administrator to sell so much of the real estate of the said deceased as shall be necessary. And that a copy of this order be published at least four successive weeks in the Mining and Scientific Press, a news paper printed and published in said City and County. M. C. BLAKE, Probate Judge. Dated October 17th, A. D. 1867. 16v15 3w

**HENDY'S LATEST IMPROVED CONCENTRATORS,**

**FOR GOLD AND SILVER ORES,**  
With Revolving Stirrers and Rotary Distributor.  
This machine is designed for saving finely divided Quicksilver, Amalgam and Gold from the sands, and for concentrating and saving the Sulphurets. Any person of ordinary experience with Quartz Mills can readily fit them up and run them.  
The principle upon which HENDY'S PATENT CONCENTRATOR is constructed, is the only true and mechanical one for the purpose of concentration.

**CENTRIFUGAL FORCE AND GRAVITATION,**  
Combined as they are in this machine, CANNOT FAIL TO ACCOMPLISH the object sought.  
Many certificates from proprietors of mills, who have this Concentrator in use, can be had, if required, giving the most flattering accounts of its efficiency.  
A most substantial evidence of its worth is the fact that the proprietor is receiving repeated orders from those who are using them, and who have tested their merits.  
The proprietor has recently still further improved the machine, by the substitution of an iron frame for the former wooden one. While nothing is added to its weight by the change, it is thus made stronger and more compact; and at the same time the labor of setting it up is considerably lessened. He flatters himself that these added advantages leave nothing further to be desired as regards the perfecting of the machine.  
Those in want of Concentrators would do well to visit some of the quartz mills that have Hendy's Patent Concentrators in use, and satisfy themselves before purchasing other Concentrators of pretended merit. **THEY ARE WARRANTED TO WORK SATISFACTORILY.**

**Directions for Operating Hendy's Concentrators:**  
The sulphurets are drawn off while the Concentrator is in motion, in the following manner:  
**FIRST**—Set the Pan, A, level, by its inner rim.  
**SECOND**—While in operation, keep the Pan, A, about half full of sulphurets.  
**THIRD**—Open the gate, E, sufficiently to discharge the sulphurets as they accumulate over the amount above mentioned.  
**FOURTH**—The crank shaft to make 200 to 220 revolutions per minute.

- References:**  
Reference is made to the following mills, which have HENDY'S CONCENTRATORS in use:
- EMPIRE MILL (7 Concentrators)..... Grass Valley, Nevada County.
  - NORTH STAR M. & M. CO. (4 Concentrators)..... Grass Valley, Nevada County.
  - NORRIDGEVOCK MILL. (2 Concentrators)..... Grass Valley, Nevada County.
  - VEATCH, VALENTINE & CO., Commercial Mill (3 Concentrators)..... Nevada County.
  - HUMBOLDT CANAL CO. (1 Concentrator)..... Humboldt County, Nevada.
  - ROBINSON & McALLISTER M & M. CO. (3 Concentrators) Hunter's Valley, Mariposa County.
  - PLYMOUTH ROCK MILL CO. (2 Concentrators)..... Calaveras County.
  - MIDAS MILL CO. (4 Concentrators)..... Virginia, Montana.
  - GOULD & CURRY G. & S. M. CO. (4 Concentrators)..... Virginia City, Nevada.
  - VULTURE CO. (4 Concentrators)..... Prescott, Arizona.
  - NOYES & CO'S MILL. (2 Concentrators)..... Prescott, Arizona.
  - LUCY MINING CO. (3 Concentrators)..... Owyhee District, Idaho.
  - MOREY & SPERRY (1 Concentrator)..... New York.
  - GUADALUPE & SACRAMENTO G. & S. M. CO..... Sinaloa, Mexico.
  - EL TASTE CO. (2 Concentrators)..... Sonora, Mexico.
  - B. F. BROWN (1 Concentrator)..... Melbourne, Australia.
- And in use in many other parts of this coast.

The following give additional proof of the increasing popularity of the machine:  
SAN FRANCISCO, October 10th, 1867.  
J. HENDY, Esq.—Dear Sir:—To your request for an expression, in writing, of my opinion in regard to the merits of your Concentrator, I reply, that I consider it the best machine for saving quicksilver and amalgam, and for concentrating sulphurets, that I have ever used, or seen used. I may add, that I could give you no stronger proof of this than to order, as I did, six more of them, after a trial of one for several months. I shall take pleasure in showing the machine in operation to any one interested, who will call at the mill of the Empire Company, in Grass Valley. Yours,  
S. W. LEE, Supt.

**SUPERINTENDENT'S OFFICE, GOULD & CURRY S. M. CO.,**  
VIRGINIA CITY, Nev., Sept. 17, 1867.  
JOSHUA HENDY, Esq., San Francisco:—Dear Sir:—According to the terms under which I secured from you four (4) of your Concentrators, namely—that they were to be paid for only after a thorough trial had demonstrated their value—I desire to inform you that I have tried them, and have found them to work very satisfactorily, and that they will now be accepted by the Company. You will please present the bill for said Concentrators, say \$1,200, at the office of the Gould & Curry Company in San Francisco. Yours, very truly,  
LOUIS JANIN, Jr.  
The bill was presented in accordance with the above request, and duly paid.

**CAUTION.**  
All of HENDY'S PATENT CONCENTRATORS are marked thus:  
"J. HENDY, Patented February 27th and April 17th, 1866."  
Orders for letters of enquiry, address,  
**JOSHUA HENDY, Patentee,**  
Union or Fulton Foundry, San Francisco.

**W. T. GARRATT,**  
City  
**BRASS AND BELL FOUNDER.**

## The Origin of the Yo-Semite Valley.

At a meeting of the Academy of Sciences of Paris, in July last, Prof. Blake, Commissioner from the State of California to the Paris Exposition, presented a paper describing the enormous action of ancient glaciers in the Sierra Nevada. He concludes that the glaciers were far more broad than the valleys now existing, and that the larger part of the central portions of the high Sierra were covered with a continuous sheet of ice.

The gorge of the Yo-Semite, with its majestic cliffs, is regarded as the result of the joint action of glaciers and of running water, and not as a fissure or break in the mountains. The paper refers to the celebrated photographs of Watkins, in illustration of the ice-worn summits of the mountains above the Yo-Semite. We translate the paper entire from *Comptes Rendus*:

*On the Action of Ancient Glaciers in the Sierra Nevada of California; and the Origin of Yo-Semite Valley.*—By W. P. BLAKE.

The traces of ancient glaciers are strongly marked in the elevated regions of the California Sierra Nevada. Almost the whole surface of these mountains, over hundreds of square miles, is wavy (moutonnée) striated, and polished.

The region in which these effects may be observed, is the central mass of mountains to the east of San Francisco, and between the 36th and 38th degrees of north latitude. It is the most elevated part of the chain; and many peaks or summits are there found of 13,000 feet (4,000 meters) or more, in height. It is the Alpine region of the United States, and it is remarkable for the grandeur of its scenery, and the number of its valleys and abrupt gorges. The western slope of these mountains descends toward the great interior valley of California; the eastern slope meets the desert region of the great interior basin. The western slope, lying under the influence of the ocean winds, is covered with magnificent forests; while the other slope is comparatively sterile. The principal rock of the elevated and central parts of the chain, is compact granite, generally porphyritic, from the surface of which crystals of feldspar, sometimes reaching the size of three or four inches (1 decimetre) project. It is this granitic rock which has been shaped and polished by the action of ice. The effect is everywhere visible above the elevation of 6,000 English feet (1,800 metres), up to the height of 11,000 feet (3,300 metres), and perhaps more.

In crossing the chain to go back from the Yo-Somite Valley to Lake Mono, the view extends over an immense expanse of summits, all rounded off by the action of ice, and in great part so highly polished that they glitter in the sun like a mirror. These

surfaces, in former times subjected to the action of glaciers, present all the usual phenomena, and those which have been observed in many other countries. They are as if planed, furrowed and striated,—generally in the direction of the valleys.

Near the defile which serves for the passage from Yo-Semite to Lake Mono, at a height of about 8,000 feet (2,400 metres), are found many subordiuate crests of granite which have been covered by glaciers from base to summit, probably 2,000 feet (600 metres) above the valley. Their flanks are not only striated and polished, but they are moreover deeply cut and scooped; and over so great an extent as to leave no doubt that they owe their present relief to the action of ice.

The glacial action has been on a gigantic scale; and the phenomena are sufficient to demonstrate that it was not confined solely to the deep valleys, but that the glaciers covered vast surfaces, and that they were of very considerable thickness. One object of this memoir is to call especial attention to this conclusion.

There were also limited glaciers which filled up numerous valleys, as is sufficiently indicated by the moraines, and the polished surfaces which they have left.

The glacial action has been more energetic upon the western declivity. This seems to show, that during the glacial period, as at the present epoch, the atmospheric moisture was more abundant upon the ocean slope than upon the continent side.

No glaciers at present exist in these mountains. The snow which falls in the winter to a great depth, melts and disappears toward the end of summer—except in the shade and in the deep gorges.

One of the most interesting portions of these regions of ancient glaciers, is situated in the famous valley of Yo-Semite. This valley is now a mark for tourists. Its picturesque character is sufficiently shown by the beautiful series of photographs, executed by Mr. Watkins, which appear in the Universal Exhibition, and some of which are here annexed.

This valley is a narrow gorge about six miles or ten kilometres long, where the traveler can contemplate a succession of granite walls or cliffs from 2,000 to 4,000 feet (600 to 1,200 metres) in height. The summits of these cliffs have the form of domes: and it is easy to recognize that this is a part of that region roughened (moutonnée) by ancient and very extended seas of ice.

Surfaces polished by ice are found in the tributary valleys of Yo-Semite, and they are not wanting upon the sides of the valley itself. The inference is drawn, that this valley is due to a *sub-glacial* erosion, caused by the flow of waters arising from the melting of ice above.

It has been thought that the Yo-Semite Valley is the result of a great fracture or fissure, transverse to the general direction of the mountain chain. The enormous action of ice in this valley and the neighboring regions, together with the fact that its upper part is divided into two or more gorges, which now receive such waters from the drainage of the gorges and valleys above, render it unnecessary to have recourse to any other explanation.

In our next issue we hope to commence a series of papers on the most recent improvements in the extraction of gold and silver from their ores—whether by pan or barrels, or without the use of mercury.

**BUSSEY'S SAFE LOCK.**—We would call especial attention to the advertisement of Bussey's Lock in another column.

## Payson's Gymnastic Swing.

Swinging is one of the most pleasing and healthy amusements in which children can indulge, and some physicians advocate it for adults for certain diseases. The ordinary rope swing, however, has so many disadvantages that it is not very generally used.

Such a swing requires the second person to assist in operating it, which is very inconvenient and tedious; in fact, it is every way imperfect, when compared with improvements presented in the annexed illustration, which is the invention of Alonzo P. Payson, of this city.

The object of this invention is to provide a swing which can be impelled by the person occupying it, and which will combine a healthy exercise with innocent amusement. To this end, a swing is constructed with rigid oscillating arms, which move about a point of suspension near the top. Between the sides or supports of the swing, and attached near the points of their suspension, are two levers, extending down to a point where they can be conveniently grasped by the occupant of the swing. These levers are attached to the arms of the swing, at

some point below their point of suspension, so that the motive levers form second levers, while the supporting arms form third levers. The manner of construction of the swing, as well as its operation, will be very readily seen from the two illustrations given herewith.

The exertion employed in alternately pushing and pulling at the levers to vibrate the swing affords the best possible exercise for the chest and arms—a fact which should especially encourage its introduction into families and public play-grounds. These swings are made either stationary or portable. The portable or parlor swing can be made of suitable sizes for rooms, and can be put up and taken down very readily. A patent for this invention was issued on the 25th of June last, through the MINING AND SCIENTIFIC PRESS PATENT AGENCY.

THE LONDON CHEMICAL NEWS, for a quarter of a century has represented the progress of chemistry in all its applications to pharmacy, manufactures and the arts generally. During the entire period of its existence, it has also given its readers a complete and faithful record of all new discoveries and advances in physical science—comprising electricity, mineralogy, metallurgy, mining, mechanical, and all collateral branches of science. It has ever occupied a foremost rank as a practical and scientific journal. The only drawback to its utility has been the high price at which its publishers have seen fit to place it, and which has hitherto resulted in preventing the general circulation which its value so justly merits. Especially has this been the case in America, where cheapness is a great feature, even in our most choice literature. W. A. Townsend & Adams, of 434 Broome street, New York, are deserving the thanks of the American public for taking the necessary steps to place this important publication within the reach of all. In July last this firm issued the first monthly number of the American edition of the *Chemical News*. The London edition is published weekly. At the first of the succeeding month the London weekly numbers are thrown into one and issued by Messrs. Townsend & Adams at the low price of \$2.50 per annum, postage paid; while the English publication is sold for \$12 a year! No interested person can afford to do without this publication at this reduced rate. The work will doubtless reach a wide circulation throughout this country. A large edition should find its way to this State, especially.

**TELEGRAPHIC.**—A most noticeable instance of American newspaper enterprise, and the advantages derivable from oceanic telegraphy, may be instanced in the fact that the New York *Tribune* obtained and published the news of Garibaldi's arrest before it was even known to a single person in London or all England. The fact was transmitted through England by the *Tribune's* special correspondent, in cypher—so that it was not even known to the telegraphic operators themselves.

## Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[By our Special Correspondent.]

## General View of the Paris Exposition of 1867.

By W. P. BLAKE, Commissioner from the State of California.

## THE METALS OF THE EXHIBITION—COPPER AND ZINC.

The most attractive display of copper in its raw state, is in the section of the United States, and I need hardly add, is from Lake Superior. The collection consists of crystallized native copper, and of the various interesting minerals and crystallizations which accompany it. There are also some of the products of smelting, and a stack of the metal in ingots of a brilliant red color, like that of the celebrated copper bars of Japan, some of which may be seen in the representation of that Empire. The various copper ores of California are displayed in the same and an adjoining case, but are more interesting for their number and variety than for their beauty. The brilliant mass of variegated ore from Plumas county, and the wonderfully rich and pure masses of red oxide of copper from the old Arizona mine, are most admired. Neither the Union or Keystone, the Newton and the Cosmopolitan, or the Del Norte county mines, did themselves justice in not sending a complete suite of their different grades of ore. As it is, the few specimens that are found here will at least gain the mines a place in the catalogue, and a mention, perhaps, in the official reports to the various governments. A series of specimens from each of our leading mines, trimmed to a uniform size, say into blocks about eight inches square, would have made an array of rich ores far finer than any other display of copper in the Exposition.

The duty of making an official report to the United States upon the copper of the Exhibition, devolves upon Mr. H. Q. D'Aligney, of Lake Superior, a mining engineer, and one of the U. S. Commissioners, who has had general direction and care of the mineral department of the United States in the Exposition since the opening. This report, with the others upon other portions of the Exposition, will be made this autumn, and will probably be printed in the spring at Washington. Although the collection from Lake Superior is quite good, as respects variety, there are no very large masses and no effort appears to have been made by the mining companies to send any. As a consequence, Russia has the credit of sending the largest mass of native copper, weighing 1,560 pounds. It was sent by Nicolas and Alexander Popoff, from the distant Kirghiz Steppes in Siberia. In this mass the sharp eyesight of Descloizeaux, the distinguished French mineralogist, detected an isolated grain of native silver. This is exceedingly interesting to mineralogists, for it shows the same association of the metals as at Lake Superior, and it indicates a similarity in the deposits, and in their origin. It is generally known, although it may not be a familiar fact to some of your readers, that at Lake Superior large lumps of pure silver are found in the midst of masses of copper; the two metals being as perfectly united as if soldered, yet there is no mingling or alloy at the junction. It is now generally conceded that these metals were deposited from solutions, under the influence of electrical currents. With this fact before me (of native silver existing in native copper at Lake Superior and at the Siberian deposits), I venture to predict that silver will also be found in the as yet unexplored native copper region of our newly acquired territory, Alaska. I have seen very large masses of copper from that place, and there is every reason to believe that we will find there copper deposits, fully equal to those of Lake Superior.

## MINES OF PRINCE DEMIDOFF, SIBERIA.

Paul Demidoff, of Siberia, has sent a large collection of the products of his various mines of copper, iron, gold and platinum. His property extends on both slopes of the Ural Mountains, and comprises over a million and a half of acres of mineral and forest lands, with a population of 54,000 persons. In this estate there are 24 copper mines, all in operation, 107 gold veins, and 20 mines of platinum. The copper mine of Medno-

Roudiansk, discovered in 1814, has yielded nearly a million of pounds of fine copper, and is worked to a depth of 574 feet. This is the mine that affords the beautiful malachite. This mineral was discovered in 1840 in an enormous mass, and over 70,000 pounds have been taken from it. The fragment sent to the Exhibition is five or six feet long and nearly three feet thick. It weighs 4,686 pounds, and is valued at \$15,000. The portions of this mass which have been polished, reveal a very beautiful grain and a fine color.

There are some very fine malachite vases, from one to three feet high, sent from different establishments, besides paper weights, inkstands and a variety of small ornamental objects, attractive in appearance and excellent in workmanship.

The Prince has 24 copper smelting furnaces on the estate, some of which smelt 35 tons of ore in 24 hours.

## MALACHITE FROM QUEENSLAND.

There is another large mass of malachite in the Exhibition, contributed from Queensland, by the Peak Downs Copper Co. This specimen is nearly six feet long, three feet wide, and one and a half thick. Its weight is not stated. It is rather dark-colored, and is not as solid as the specimens from Siberia.

The famous Burra Burra mines of South Australia are not fully represented; but there is an extremely interesting collection of the beautiful blue carbonate crystals associated with malachite.

The English and Australia Copper Co. make a good exhibition of their products in bars and slabs of refined copper, and ordinary black copper, for which they have obtained a bronze medal.

## COPPER ORES OF CHILI.

Chili makes a very heavy exhibition of copper ores. They have been sent in great masses and are piled together in magnificent confusion, with the figure of a miner in full costume standing at one end of the heap, as if upon guard. These blocks are chiefly yellow copper ore, and the variegated ore, with some gray copper and some masses of cupriferos silver ores. The copper mines are the most important and profitable in Chili, and employ the greatest number of workmen, as the following figures will show. There are now in actual working or development, 1,668 copper mines, 268 silver mines, 663 coal mines and the total number of miners is 23,743. In 1863 there were 347 high, or cupola furnaces, for the smelting or fusion of copper ores. The provinces richest in copper and silver ores are those of Atacama and of Serena in the north. They afford nearly three-quarters of the annual production of the country. The most important mines, also, are not far from the coast, and are connected by railroad with some of the best ports, so that the facilities of transport and exportation are great and comparatively inexpensive. Copper, and its ores, is, however, not confined to any particular part of the State, but is very generally distributed in the interior along the Andes, from Talco in the south to Majellones in the north, or over a distance of nearly twelve degrees of latitude.

The value of copper and its ores exported from Chili in 1865, was over \$14,000,000, most of which went to England. A large part of it is sent in the form of matte (concentrated ore by fusion), and some in the form of bars and ingots.

## DECLINE OF THE ENGLISH MINES.

The production of copper ores in Cornwall has been steadily diminishing, and now many of the mines are closed, for they can no longer be worked with profit while the price of copper is so low. The mines are in general very deep, and the ores very poor compared with those of California, Chili and other parts of the world.

There are very few exhibitions of these ores, or from the extensive copper smelting establishments of Great Britain. In one small collection from Swansea, I saw samples of our ores from Calaveras county and from the Colorado river.

## COPPER SMELTING FURNACES.

There are several extremely interesting collections of copper in its various stages of progress by smelting from the ore up to the refined or rose copper for use. These collections show not only the metal in its various stages, but the fluxes, the scoriae and the fuel used. They are accompanied by carefully made models of the furnaces employed. The models are so constructed that they open into two portions, and thus not only show the exterior, but the interior construction. They are carefully made to a scale, and are intended to serve as a guide for the erection of large furnaces. They would be of great service to us in California, and I have regretted that the State has no institution provided with a fund which might be applied to the purchase of such

models, for the benefit of our mining population, and the instruction of our young men who are turning their attention to mining and metallurgy.

## MANSFIELD COPPER SCHISTS.

The company occupied in the working of the Mansfield copper schists, has made a fine display of the products of the mines and of their works for the manufacture of sheet copper and copper boilers. The production of the mines in 1866 was not less than 21,712 quintals of rosette copper, and 24,554 quintals of refined copper. Among the articles of manufactured copper may be noted a sheet nineteen feet nine inches long and nine feet wide, weighing 4½ pounds to the square foot. Another sheet ten feet long and three feet wide, and a boiler or kettle 8½ feet in diameter and three feet deep. It is claimed that the works can turn out copper sheets ten feet wide and thirty feet long. The mines and works of this company give occupation to 5,500 men.

## ZINC ORES AND MANUFACTURES.

The principal exhibitions of this metal and its products are made by the Prussian and French companies, foremost of which is the *Vielles-Montagne*. This company is not exclusively occupied with zinc mines; it owns, also, deposits of lead, iron pyrites and coal. It has establishments in Germany, Belgium, France and Sweden. It employs in all 6,223 workmen, of which 2,693 are in Belgium. It produces 70,000 tons of zinc ores annually, 2,700 tons of lead ores, 2,000 tons of copper ores, and 110,000 tons of coal. Its manufactures are metallic zinc, 32,000 tons, sheet zinc, 25,000 tons, besides some 800 tons of zinc nails and small articles. The manufacture of zinc-white—the white oxide of zinc—used for painting, has reached the figure of 6,000 tons. The sales of the company per annum are, in round numbers, as follows:

	Tons.	Value in francs.
Metallic zinc.....	35,200	26,400,000
Zinc white.....	6,800	4,272,000
Ores of lead, &c.....	5,800	1,685,000

The white zinc is made near Paris, by the combustion of the metal, and not directly from the ore, as by the American method. The specimens of ore exposed by the company consist chiefly of blende—the sulphuret of zinc—in large masses weighing from 400 to 800 and 1,000 pounds each. This company has a formidable competitor in the Silesian Zinc Company, of Breslau, which was established in 1853 with a capital of 5,000,000 Prussian thalers, since then increased to ten millions. One of the chief merits which this company claims for its zinc, is that it is all made from calamine and not from blende, and is therefore supposed to be free from sulphur and to be stronger and more ductile. There is a very fine show of zinc plates, corrugated sheets for roofs, perforated plates, nails, wire and tubes. The largest plate is 17 feet long and 54 inches wide, and three-quarters of an inch thick, and it weighs 2,100 pounds. It could have been made twice as long and heavy, if the space had been allowed for it. The new exchange building at Berlin is roofed with the corrugated zinc plates of this company's manufacture.

But in all the zinc exhibited by these two companies, and several others, there is none equal in quality to that produced by Wharton from the ores of Lehigh county, Pa., and exhibited by him in the American section. This zinc is nearly chemically pure, and may be used as such in analysis when testing for arsenic.

The New Jersey Zinc Co. of New York, is represented here by samples of the ores from the mines of Sterling Hill and Franklin, New Jersey, and by the products of the works at Newark. These consist chiefly of white zinc, dry and ground in oil for paint, and of the hard, white, manganiferous iron, generally known as "Franklinite iron." This industry of zinc and iron combined has assumed large proportions, and is very successful. It was founded chiefly through the exertions and enthusiasm of James L. Curtis, of the city of New York, who had a correct appreciation of the importance and value of these ores and of zinc oxide for paint as compared with poisonous lead, long before the incredulous public could be convinced.

I do not know of any extensive deposits of calamine in California. There are some localities of blende, but it is not probable that they can be worked to advantage for several years to come.

The only *contre-temps* that I have experienced in the Exhibition was in gaining some information for this letter. I was interested in taking measurements of portions of one of the furnaces exhibited, and was finishing a drawing of the retort when one of the omnipresent *gens d'arme* laid violent hands on the sketch and notes, under the authority of the law, expressly forbidding persons to make designs or measurements without the consent of the exhibitors. A pertinacious

protest secured the return of my notes without the drawings, which I was able to reproduce in much better style on my return to my room in the evening. In this case, the exhibitor had evidently no desire to conceal anything; for the exhibition of the retorts was complete, and was in no way essential as a part of the exhibition of his manufactures. The incidents show the strictness with which the rules of the Imperial Commission are enforced.

Paris, Sept. 2d, 1867.

## Brain Development.

A correspondent of the *American Phrenological Journal* propounds the following:

"Is there anything made or lost in the whole brain? Or, can any organ or group of organs be increased by cultivation without a proportionate decrease in the opposite extreme? If the higher faculties, by culture, are increased, do not the lower or the selfish faculties decrease, and *vice versa*?"

The editor, in reply to the query, says:

Let us suppose a child ten years of age to have a brain developed in perfect harmony. If the culture of every faculty and propensity be equal, the brain, at full maturity, will possess an equal development, every part growing in just proportion. If, however, one set of faculties are exercised chiefly from ten years of age upward, the corresponding organs will become enlarged and strengthened—not necessarily at the expense of the others; but those which are exercised most will increase in size and activity much more rapidly than those which are exercised but little. \* \* \* \* The brain is not shut up in a tight box, which cannot be enlarged to make room for the growth of the brain. When one organ grows, it is not obliged to do so at the expense of the others. If one organ wants more room, or if the whole brain requires more room, the skull is absorbed on the inside and built up on the outside. It often happens that a single organ is more active than others by which it is surrounded, and the activity of the one organ causes the absorption of the skull directly over it to such an extent that the skull in that place becomes so thin that a slight pressure would break it or crush it in; and we have known cases where *post-mortem* examination showed the skull to be worn quite through over organs which for many years had been uncommonly active. Thus sometimes a man after twenty years of age will have such an increase of the size of the head that the whole skull changes place; if we may so speak, the skull at twenty would be swallowed by the skull at forty. It is sometimes a mystery to people how a hard, bony structure like the skull can give way and make room for a pulpy substance like the brain. The same reason might be applied to oysters and clams. They are soft and pulpy, and their shells are as hard and a trifle thicker than the human skull. But everybody knows that a clam or an oyster half grown can be placed, shell and all, into the empty shell of a clam or oyster a year or two older. The whole substance of the shell changes place; it is not enlarged merely, but completely dissolved and thoroughly reconstructed.

In addition to the above, we may remark that in most skulls, especially in those of persons who possessed marked characteristics in their lifetime, or whose particular organs have been largely developed while others have been allowed to lie dormant, a great variation in the thickness of their different parts may readily be detected by holding a lighted candle on the outside and looking in towards the candle. The light will show *thin* places at the localities of all the organs which have been particularly active during lifetime.

The bones of the body are also usually smaller, in proportion to the crania, in persons of sedentary and intellectual habits, than in those whose life is devoted to severe physical labor, and *vice versa*. In holding a candle to the skull of the man who has been noted for his intellectual character, the base will appear dark, from its great thickness, while the light will clearly glimmer in the region of the intellectual and moral faculties. The operations of nature are scarcely more clearly developed in the fossiliferous indications of the earth's crust than are the habits of the human being in the records indelibly stamped upon the cerebral covering.

ENGLAND is still adding to her iron-clad navy. A large vessel of the size of the *Minotaur* is to be constructed.

Mechanical.

Working Steam Expansively.

(Continued from page 275.)

If the valves giving admission to and exit from a cylinder could be opened suddenly at the proper time, and if, further, the steam admitted worked without expansion, and entered and escaped from the cylinder without sensible frictional retardation, then would an indicator diagram taken under

such circumstances, be a perfect rectangle, shown by *c, f, d, g*; and if its altitude represented the boiler pressure and vacuum combined, while its length represented the stroke of the engine, then would the diagram represent the greatest possible amount of power which could be got out of the engine during any one stroke under the given limitations of boiler pressure and vacuum. We have now lying before us a diagram taken from a steam fire-engine, the valve of which has very little lap or lead, which is nearly a perfect rectangle; but such diagrams are never taken from engines in which economy of fuel is studied—a matter of no importance whatever in steam fire-engines. In all such cases the diagram shows a portion only of the complete rectangle, and it may be divided into two parts; one of these represents the power exerted while steam continued to enter the cylinder, the other the power exerted after the admission port was closed by the steam expanding. Now, as a perfect rectangle would represent the greatest amount of power which can be obtained through any single stroke, so will a perfect rectangle represent the maximum development of power through any portion of a stroke to which that rectangle corresponds. In the case of the practical steam engine this rectangle can only be contained between a line, *a, b*, drawn across the diagram from the point where admission ceases and the terminal line of the diagram, *c, d*, representing the maximum pressure in the cylinder. Under any circumstances that portion of the cylinder corresponding to the rectangle must receive the same volume of steam from the boiler, that is to say, it must be filled; and it is therefore important that during this, the first portion of the stroke, the engine should develop the greatest possible power; but this condition can only be insured when the action of the valves is such that the first part of the diagram, as we have said, is approximately a rectangle. If the valve opens too slowly the line of maximum pressure will be shown by *e, d* in the cut, and the space between it and *c, d* represents a loss of fuel, because while the piston moved through the space corresponding to *e, c*, it was not submitted to a pressure equal to that attained subsequently; but before this maximum pressure could be attained at all, the space, *e, c, d*, had to be filled up to the maximum pressure by steam doing no work on the piston; the loss, in a word, exactly resembles in character that due to clearance. If, on the other hand, the valve opened too soon a space would be cut off the rectangle at the lower corner (as shown by the dotted line), which would represent a loss of power but not a waste of fuel, as the steam compressed would be available for the return stroke. Still, it is not expedient, from many reasons well understood, that compression should be carried to excess, and therefore the more nearly a perfect rectangle the full pressure part of the diagram is, the better, within certain limits.

So much for the influence exerted on the shape of the diagram by the opening of the admission and the closing of the exhaust port. We have now to consider the influence of the mode in which the admission closes. If the valve acts quickly, expansion will commence at the point, *a*; and if the cylinder be kept hot, the curve of expansion will be nearly that due to the operation of Mariotte's law. If the port is not closed quickly, steam will continue to find its way into the cylinder, and the curve will be too high. It is true that the steam so entering will act to impel the engine and increase the total power of the machine; but this steam acts to a disadvantage, a great portion of its pressure being lost through wire-drawing. Its effect, indeed, will be as though it acted almost altogether without expansion. We find a precise parallel in the case of an engine working steam which is wire-drawn, and therefore is worked at a

loss. It is unnecessary to point out how essential it is to economy that the exhaust port should be opened as quickly as possible to its full area.

The deductions from the foregoing statement of facts lie in a nutshell. The valve of a steam engine should open and close the ports as quickly as possible at the proper time, and any arrangement which will effect this sudden opening and closing will give first-class results as far as economy is concerned; whether the action is the best possible may be at all times determined by taking a diagram. Now, it so happens that diagrams taken from engines with the common slide valve with a good lap and lead, and a long stroke, may be, and frequently are, quite equal to any which are taken from engines with the most complex gear; nor can we ascertain that any economical results have ever been obtained from complicated engines, as a consequence of the action of their valves, which cannot also be paralleled with ease in the case of engines of the simplest construction. The fact—and that it is a fact admits of the fullest proof—demonstrates that the use of complicated valve-gear is a mistake. It adds to the first cost of the machine and to the expenses of its maintenance; while the assertion that by such means, and such means only, economy of fuel can be realized, tends to retard the adoption of the principle of expansion to the fullest extent which is desirable. It appears, upon the whole, the distribution of steam can be effected by two D valves, one at each end of the cylinder, each controlling an exhaust and admission port, about as well as in any other way. The valves may be of the gridiron or marine engine type, worked by a single eccentric, and provided with an amount of lap corresponding to the required point of cut-off. The valves when large may be balanced by a simple ring at the back. If it is deemed desirable to introduce a still sharper action of the valve than can thus be had, a second eccentric may be employed working cut-off valves on the backs of main valves, and these cut-off valves can easily be made to act the part of equilibrium rings. The ordinary link motion, or a modification of it, with but a single eccentric, may be used when it is desirable that the cut-off should be variable. An engine constructed on such a principle will cost less money, be less liable to get out of order, require less care in its management, and give more satisfaction, even as regards economy of fuel, than complicated machines, delicate in their operation, and extracting, or pretending to extract, a fraction more power from each pound of coal burned than their apparently commonplace rivals. Cam-gear and puppet valves constitute in some respects a better arrangement than any modification of the slide valve, but unfortunately one not very well suited for engines running much over twenty revolutions per minute. The maximum degree of complication admissible in stationary engines is represented by the use of a second slide worked on the back of the main valve by a distinct eccentric, and even this is only required in the case of engines expanding largely in a single cylinder. When compound cylinders are used a very early cut-off is not required, and the ordinary slide valve will upon the whole give, over a series of years, more satisfactory results than any other arrangement.—*The Engineer*.

STEAM BOILERS, iron bridges and iron ships are rated in strength only about one-fourth and one-sixth that of the iron as tested by experiment. This is for the purpose of making allowance for flaws that may be in the metal, and which cannot be detected by simple inspection. There is also such a great difference in the quality of the iron plates turned out in the same establishment that it is prudent to make allowance for all defects.

The inhabitants of Quito manufactured magnificent mirrors from "obsidian," and those of the Azores and Ascension Islands, and Guiana, used splinters of obsidian as points for their lances, razors, etc.

THE FIVE MECHANICAL POWERS. — The lever, the inclined plane, the wedge, the screw and the pulley, are termed "the five mechanical powers."

DENSITY OF LEAD.—The density of lead is not materially increased by hammering or pressure. It is but very slightly increased by any means whatever.

AMERICAN CARS are to be put on the rail-road from London to Liverpool.

EIGHTEEN new bridges have been built across the Seine during the reign of Napoleon III. at a cost of about \$5,000,000.

Scientific Miscellany.

BEST LIMESTONE FOR MAKING IRON.—Notice was given through the papers some months since that the Iron Master's Laboratory at Philadelphia, would carefully analyze, free of expense, 100 specimens of such limestones as were found most beneficial, in actual practice, as a flux for blast furnaces. A large number of samples were sent in from various parts of the country; but only 35 out of the entire number sent could be taken "as a fair average of the kind found by actual use the best adapted for furnace purposes." The result of these analyses (the average result as we understand it) was as follows:

Water.....	49
Siliceous matter.....	4.13
Oxide of iron and alumina.....	2.40
Carbonate of lime.....	85.83
Carbonate of magnesia.....	6.36
Solid carbonaceous matter.....	1.19
Manganese.....	trace
Loss.....	.74
	100.00

A WONDERFUL MOLLUSK.—A correspondent of the *Bulletin*, writing from Santa Barbara, refers as follows to a *Tridachna Gigas*, which will hold in each half of its shell from one to four gallons. This shell contains an animal mass of tough pulpy meat like the large *Cytheria* or California white muscle of the Santa Barbara Channel, and it may be seen walking about with its heavy feelers on the coral reefs in calm weather, and bearing a weight of from 10 to 20 pounds of shell according to age. The meat is used by the natives for food, and the shells for domestic purposes, and it is said to be the largest of the mollusca known to naturalists. It is in the central parts an inch thick, the inside beautifully white, and on the outside ribbed and grooved like the Palmer's shell, so common on the Lower California coasts, which is a picture of those figured on the dresses of the old Crusader Pilgrims or Palmers; hence its name. The hinges to these *Tridachnas* are strong as iron while moist, and the edges or openings of the feeding parts dovetail together most cunningly. There seems to be two species of them, one found in the East Pacific, and the other in the Molucca Archipelago, and they are among the most curious, useful, and interesting objects in marine zoölogy.

A subsequent correspondent of the *Bulletin*, "Oakland," in referring to the above, says:

\* \* \* Instead of but two species, Woodward gives six recent ones and a fossil. \* \* \* These shells are not of recent discovery. Darwin, in his journal, accords the fact of his remaining a long time in the lagoon of Keeling, Ist, examining the fields of coral and *gigantic clam shells*, into which, if a man were to put his hand, he would not, as long as the animal lived, be able to withdraw it. Dr. Good, in his Book of Nature, states that the entire crew of a British frigate feasted on the animal of one *Tridachna Gigas*, found in the Indian Ocean. Your correspondent very truly says that this is the largest known species of shell fish; but scarcely conveys a correct idea of the great size to which it sometimes attains. Whoever has visited the Church of the Sulphice, in Paris, has probably seen a pair of valves of this shell, measuring more than two feet across, and said to weigh over 500 pounds. It would indeed be a strange and most wonderful sight to see the animal with such a shell "walking about;" for when alive, the large excavation in each valve provides a forearm or hole for the passage of a byssus or strong short cord, which binds the shell to the coral rock in a fixed position, with very slight powers of moving from infancy to old age. The range of this genus is quite extensive, including the Indian Ocean, Northern Australia and a large portion of the tropical, Pacific islands.

COPPER FOR CHOLERA.—Dr. V. Burg having observed in 1852 that about 200 persons working in and around a copper foundry were not attacked by cholera, even during the worst stages of the epidemic, made further inquiries, and found that all persons handling this metal, whom he met, enjoyed the same immunity. He, therefore, concluded to try the use of copper as a medicine for those attacked by cholera. He administered sulphate of copper internally and applied metallic copper externally. It was asserted by some medical authorities that the plan was not successful, but a late communication to the French Academy by Dr. Lisle of the luatic asylum at Marseilles, contains the statement that he had cured 20 out of 24 patients by administering sulphate of copper, even in smaller doses than those prepared by Dr. Borq.

SOUND MADE VISIBLE.—At the Royal Institution in London, recently, Professor Tyndall repeated some of the interesting experiments by which he has on previous occasions given ocular proof of the effects of sonorous vibrations. When a jet of gas is burning under an amount of pressure which is but just short of the "flaring" point, it becomes excessively sensitive to a momentary increase of pressure, and will respond in the readiest manner to the slightest acute sound, vibrating actively to the merest "ohirrup" of the lips. A still more remarkable demonstration was made with a thin column of smoke, of which the shadow was cast on a screen by means of an electric light. Here the smoke became so sensitive that the slightest vibrations of the air affected it, and two tuning-forks making a discord produced the well-known heat, which was attended by a marked pulsation of the edges of the shadow. Perhaps the most beautiful ocular demonstration of the effect of sound was produced by throwing the electric light through a minute stream of falling water, the effect being to produce a string of glittering drops of the most brilliant appearance. When musical notes were sounded in the vicinity, these drops altered their arrangement in obedience to the waves of sound, and clearly indicated by their modified appearance the effect produced upon them.

SULPHURETED HYDROGEN.—This gas, which for experimental purposes is usually obtained by means of sulphuret of iron, may be procured more conveniently, and in a state of greater purity, by the use of sulphuret of calcium. The latter is formed very easily by mixing uncalcined powdered gypsum with one-fourth of its weight of calcined gypsum, and powdered pit-coal equal to one-third of the whole of the gypsum used, and working up the mixture to a stiff dough with water; next forming it into pieces four inches long, two wide, and one and a half thick, sprinkling them with powdered coal, and drying them, then placing them with coke in a high temperature two hours. When cold they will be found externally to consist of oxo-sulphuret of calcium; but internally of pure peach-colored sulphuret of calcium, which may be broken in pieces about the size of nuts, and preserved in a well stoppered glass bottle. If water is added to these, and then sulphuric acid in small quantities at a time, sulphureted hydrogen is given off with great uniformity.—*Scientific Review*.

CLARIFYING ACTION OF SULPHATE OF ALUMINA ON TURBID WATER.—Whatever be the nature and quantity of the earthy substances held in suspension in turbid water, it becomes fit to drink in from seven to fifteen minutes if to each liter there be added .04 grammes of finely-powdered alum, care being taken to agitate the liquid when the alum is introduced (this is about three-quarters pound per ton of water. If potash alum is used, the alum is decomposed into sulphate of potash, which is all dissolved by the water; and sulphate of alumina, which, by its decomposition, purifies the water. The alumina separates in an insoluble form, and carries down with it as it precipitates the matters which render the water troubled and the organic matter. The acid attacks the alkaline and earthy carbonates, and transforms them into sulphates. The water becomes slightly richer in bicarbonates and free carbonic acid, whilst all organic matter is destroyed. Seven parts of sulphate of alumina will purify as much water as ten parts of rock alum or potash alum, and the sulphate of alumina does not introduce any alkaline sulphate into the clarified water.—*Technologist*.

WATER AS A GAS ABSORBER.—Set a pitcher of water in a room, and in a few hours it will have absorbed nearly all the respired and perspired gases in the room, the air of which will have become purer, but the water utterly filthy. The colder the water is, the greater the capacity to contain these gases. At ordinary temperatures a pail of water will contain a pint of carbonic acid gas, and several pints of ammonia. The capacity is nearly double by reducing the water to the temperature of ice. Hence, water kept in the room awhile, is always unfit for use. For the same reason the water from a pump should always be pumped out in the morning before any of it is used. Impure water is more injurious than impure air. This shows the economy and the convenience of a modern ice pitcher,—a splendid invention, which, as it seems, is more than ornament and show; aye, it is really and absolutely a necessity. Let these hints be heeded by our health-loving and life-preserving readers.

New Patents and Inventions.

Under this heading we shall mention, from week to week as occasion may demand New and Important Inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to Inventors on the Pacific Coast, and other Patent Issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

PATENTS RECENTLY ISSUED.

69,393.—TOOTH POWDER LOZENGES.—Chas. E. Blake, San Francisco, Cal.: I claim the making of tooth powder in the form of lozenges.

69,453.—SEWING NEEDLE.—G. A. Lloyd and S. Felton, San Francisco, Cal.:

We claim making the eye so far from the rear end of the shaft that it will carry the right of the thread or twine through the cloth sewed when the needle is pushed through the cloth by the thimble or palm, substantially as described.

We also claim diminishing the shaft of the needle from a little behind the eye gradually to the end, both in width and thickness, substantially as described.

69,554.—WAGON BRAKE.—Corydon A. Fargo, Soquel, Cal.:

I claim, 1st. The brake constructed with the arm, E, and link, G, together with the connecting-rods, D and I, having a variable connection with E and G, respectively, or their equivalents, operating substantially as and for the purpose herein described.

2d. The vibrating suspending arms, c, c, and the cross-bar, d, attached to the bar, K, for producing parallel motion, substantially as herein described.

This invention consists in so constructing wagon brakes that a great increase of power and efficiency is attained without lengthening the lever or complicating the mechanism; while, at the same time, the brake may be moved to such a distance from the wheel, when not in use, as to entirely avoid clogging in any weather. In consists in so suspending the brake from the body of the wagon that it is in the same relative position to the wheel, whether close to it or removed to its greatest distance. To effect this, the brake is made with a lever, within convenient reach of the driver, and a connecting-rod reaching to the arm which rotates the shaft and short lever under the wagon, which in turn actuates the brake-bar, extending entirely across the body of the wagon, and having a brake-block, on each end, to operate upon the hind wheels of the wagon, when desired. The connecting-rod has a variable attachment to the rotating arm to increase the leverage, while the short lever, operating directly upon the brake-bar, has a cam-like or eccentric motion, greatly increasing the power of the lever, as the blocks are pressed hard against the wheels. When the brake is not in use, the levers, by their variable action, throw it to a greater distance from the wheel than the ordinary levers can do. The brake-bar is suspended from the wagon-body by a system of rods, so that it keeps its parallel motion as it moves, and all parts of the block are equally distant from the wheel.

69,564.—AMALGAMATOR.—Fred. G. Hesse, San Francisco, Cal.:

I claim, 1st. Separating as to size, by means of the separating channel, h, wherein the particles are acted upon by the two opposing forces, centrifugal force and resistance of a current of water, said current being produced by a centrifugal head, and made adjustable in the manner and for the purpose substantially as described.

2d. Combining separation with grinding, in order to prevent the grinders from acting upon particles already fine enough, substantially in the manner as described.

3d. The revolving amalgamating chamber, A, in combination with the stationary cylinder, t, and also in combination with the current of water, as described.

4th. The discharge, T, in combination with the filtering-chamber, F, and a current of water produced by centrifugal action, for the purpose and in the manner substantially as described.

5th. The annular channel, g, e, formed behind the grating surfaces and in combination with the annular disk, a, a, forming an annular channel under C, which communicates with g, for the purpose of producing by centrifugal action an upward current therein, the strength of which may be regulated by the dimensions of n, for the purpose substantially as described.

69,663.—WASHING MACHINE.—Samuel R. Holmes, Salem, Oregon:

I claim, 1st. The rollers, D, and roller-frames, B and C, placed in a vertical position and vibrating at the same time in opposite directions, in combination with each other and with the box, A, substantially as herein shown and described and for the purpose set forth.

2d. The combination of the double crank, G, and pitman, I and J, with the vertical roller-frames, B and C, and with the box, A, substantially as herein shown and described, and for the purpose set forth.

3d. The combination of the lever, K, connecting-bar, L, crank-shaft, M, and slotted plates, f, with each other and with the box, A, and sliding frame, F, substantially as herein shown and described, and for the purpose set forth.

59,575.—WRENCH IMPLEMENT.—John Mott, Danville, Cal.:

I claim the above described wrench or implement, constructed and arranged to operate as and for the purposes set forth.

The object of this invention is to provide an improved wrench, which shall combine, in one implement, a wrench easily adjustable to any sized or shaped nut, and which shall at the same time answer for the purpose of a hammer and a claw for extracting nails, while the handle, being made hollow, shall also serve as a receptacle for such small tools as may be found most convenient or necessary to be so kept for ready use. The wrench is made of cast or wrought iron or steel, according to the quality or price desired, and also of different grades or sizes, according to the nature of the work for which it is intended. The body or stationary joint to which the handle is attached, has a projection below, forming the hammer, and having the claw connected to it. Through this lower jaw are made two vertical openings or slots, through which pass two guides or supporting bars; these bars being sufficiently separated to give firmness to the upper jaw, to which they are attached, and to ensure it an up and down motion, parallel with the lower jaw. A screw passes through the two jaws, either before or between the two guides, the female screw being cut in the lower jaw, while a collar or pin insures the proper motion of the upper jaw as the screw turns.

This invention was exhibited in the shape of a neat iron model, at the recent State Fair at Sacramento. Honorable mention was made of it by the Committee on Awards.

69,581.—BALL ALLEY.—J. D. Patrick, San Francisco, Cal.:

I claim the above described arrangement of the targets, D, and oblique backs, C, in combination with the alley, A, and return-alley B, substantially as set forth.

This invention consists of a peculiar construction and arrangement of a ten-pin alley, the object of which is to provide an improvement in that class of games in which balls are rolled upon an alley or table, and made to count in the game by knocking down pins or other devices. Instead of the pins usually employed, a series of targets are so arranged across the end of the alleys, that there is more difficulty in striking one than the other with the balls, and a greater or less count is made accordingly; by which means there may be an equal amount of dexterity displayed as in the use of the pins, without the trouble and delay of setting them up, or the noise and confusion created in knocking them down. A target, when hit, is removed from its place so as to be distinctly seen from the opposite end of the alley, and after the count is made, it is returned to its place by a spring, operated by a lever at the forward end of the alley. Thus all necessity for assistants to the player are dispensed with, and the ball-alley may be made a convenient place for exercise on any gentleman's premises.

69,726.—WASHING MACHINE.—John Vail, Yankee Jim's, Cal.:

I claim, 1st. The combination and arrangement of the sliding box or tub, B, the pounders, D, shafts, E, cam, H, and shafts, I, with each other and with frame, A, substantially in the manner herein shown and described and for the purpose set forth.

2d. The combination of an ordinary wash-board, C, and movable side b, with the tub, B, substantially as herein shown and described and for the purpose set forth.

3d. The combination of the levers, N and O, and block, P, with the sliding tub, B, and with the frame, A, of the machine, substantially as herein shown and described and for the purpose set forth.

4th. The combination of the lever, K, shaft, L, arm, M, and movable frame, G, with the pounder-shafts, E, and with the frame, A, of the machine, substantially as herein shown and described and for the purpose set forth.

To BE DEDICATED.—The elegant rooms of the Chamber of Commerce, in the new Merchant's Exchange, are to be formally dedicated, with suitable services, a supper and speeches, on Tuesday next. The event promises to be one of a notable character.

Weekly Stock Circular.

Of Associated Brokers of the S. F. Stock and Exchange Board.

SAN FRANCISCO, SATURDAY MORNING, November 9, 1867.

Money Market.

The market is plentifully supplied with Bullion, Gold Bars ruling at \$70@85—dull. Silver Bars sell within a range of 1/2 per cent. discount to par. Exchange on the East ruled as follows on the 8th inst: Currency Bills, 36 per cent. premium on gold; Sight Drafts, payable in coin, 2 per cent.; Telegraphic Transfers, 2 1/2 per cent.; Sterling Exchange, 4 1/2 d; Commercial do. 4 1/4 @ 4 1/2 d. On Paris, 5 frs for 30-day bills.

The duties paid at the Custom House in this city since October 29th, and previously this year, have been as follows:

Table with columns for dates (October 29th, 30th, 31st, etc.) and amounts in dollars and cents.

Total since January 1st, 1867, \$6,767,380 73

The shipments of Treasure from October 1st to date have been as follows:

Table with columns for dates (October 7-10, 14, 18, 19, 30, 31) and destinations (California to Victoria, New York, France, etc.) and amounts.

Total since October 1st, 1867, \$3,039,397 30

Previously this year, \$1,726,944 52

Total since January 1st, 1867, \$34,768,341 82

Corresponding period, 1866, \$8,499,629 19

Decrease this year, \$26,268,712 63

City Stocks.

The very general and unlooked-for depression in the mining share market since our last reference, seems to have operated as a check upon the introduction of other stocks, and, in the absence of the ordinary line of transactions in shares other than mining, we have to report a very dull market. California Steam Navigation Co. is a shade better, selling at 76@77 per cent. Spring Valley Water Co. is in less favor, selling at \$66 per share. San Francisco Gas stock sold at \$66@67, then at \$66 50, and at the close \$67 is bid. At the close, we note sale of Sutter Street Railroad stock at \$11.

Mining Share Market.

The mining share market has been characterized by a still further decline from closing quotations of last week. The rapid recession has produced more than the usual amount of speculation, and several stocks were heavily dealt in, particularly Savage and Kentuck, both showing a very material decline under the pressure. During the past three months the various claims on the Comstock Lode have yielded a materially lessened amount of bullion than formerly, and until developments are carried to a greater depth, we may look for a decline in this respect for some time to come. The setting in of winter will also contribute to this result. The aggregate receipts of bullion from the Savage, Confidence, Gold Hill Quartz, Gould & Curry, Kentuck, Crown Point, Imperial, and Empire during the month of October amounted to \$667,263, against \$717,392 in September, showing a decline of \$50,119. Several monthly dividends have already been announced as noted below.

CROWN POINT—has met with less inquiry at declining rates, dropping from \$585 to \$470, and closing at \$325. A telegram of the 6th inst., says the north and south drifts on the lower level look about the same. They have started to drift south on the 600-foot level, and from the 500-foot level they continue to obtain considerable ore. The average assays of ore produced in October have been higher than usual. Preparations are complete to carry the shaft to a further depth. At the close of October this company had 600 tons of ore at the mill and dump. The bullion receipts for October foot up \$42,000 against \$49,000 in September. Assessment of \$100 per foot delinquent on the 11th inst.

CHOLLAR-POTOSI—has been more active, but sold at greatly lessened rates, receding from \$157 50 to \$114, and closing yesterday at \$127. The various stations of this mine yielded 1,886 tons during the week ending October 31st, against 1,921 tons in the previous week. It is said that the Pinto station is nearly exhausted, while the Pinto switch station promises well for the present month. The Santa Fé third is improving at the north end. Work has been steadily prosecuted in the new shaft since the 28th ult., and the drifts north and south, as well as those going east, run in clay and porphyry. On the 4th inst., 192 tons of ore were delivered. No dividend will be disbursed during the present month.

YELLOW JACKET—opened at \$370, receded to \$320, then sold at \$327, and closed at \$325. The old works of this mine are yielding a small amount of ore. The shaft is being rapidly sunk toward a new station, which will be opened at the depth of 900 feet from the surface. The winze toward the Kentuck line continues in about the same quality of quartz and ore as before. Assessment of \$100 per share will be delinquent on the 11th inst.

GOULD & CURRY—sold at \$310@225, and at the close realized \$300. The work on the east drift, 600-foot level, progresses satisfactorily, but as yet little has been done to notice any material change in the appearance of the rock. An inadequate supply of water continues to be a drawback at the mill. The yield of the old works is about 100 tons of ore per day.

HAILE & NORCROSS—sold at improved figures early in the week, advancing from \$655 to \$930, falling to \$685 and closing at \$740. We are informed that the drift south from the north winze, on the 780-foot level, is in good ore, said to mill about \$40 per ton. The other drifts are about the same as heretofore reported. The receipts of bullion for October will fall short of \$50,000; in September the yield was nearly \$72,000.

SAVAGE—exhibited great activity under a very serious decline, selling as low as \$88 per share, or \$1,760 per foot, not having sold at this price within the past year, rose to \$97, and closed at \$92, ex dividend. The amount of ore extracted during the past three weeks compares as follows:

Table with columns for dates (November 2d, 26th, October 19th) and amounts in tons and dollars.

The Superintendent writes that the north breasts on the third station open out fairly at the 60-foot station, and the same have been developed sufficiently to produce a larger quantity so soon as thought advisable. No work has lately been done in the extreme north drift on this level. The Potosi drift on the same level has been turned north in order to get under the works of the seventh station. The south drift on the fourth station shows no improvement, and it is believed that they are still to the west of the ore seam. The south winze from the third station is down eighty feet, and is still over one hundred feet distant from the above drift; the north-west drift is said to show some improvement. The main shaft is now thirty feet below the fifth station. Receipts of bullion in October amounted to \$362,066 62, against \$360,295 29 in September. A dividend of \$7 50 per share is payable on and after the 8th inst., and after this disbursement they carry over a balance of \$60,000.

KENTUCK—has been in the market to a large extent, experiencing a serious decline, dropping from \$150 to \$95, advanced to \$120, and closed at \$125. This company reduced about 3,600 tons of ore during October. The yield of bullion for the same time has been \$95,620, with the clean up of one mill to hear from; in September the yield amounted to \$101,000. The 14th dividend, \$7 60 per share, is payable on and after the 9th inst.

AMADOR—was in the market at \$210. The yield of bullion in October amounted to \$38,665, being the product of 1,650 tons—over \$23 to the ton. The holder ledge of this mine, previously alluded to by us, produced more than half of the above amount. They have crossed this ledge some nine feet, and as they proceed continue to improve; the main ledge is from seven to ten feet wide. In the south stopes the rock looks well, averaging over twelve feet in width. The Badger shaft is thirty-three feet deep. A dividend of \$6 per share is payable on and after the 9th inst.

CONFIDENCE—sold at \$40 seller 30. We extract the following statement from the Secretary's annual report for the fiscal year ending October 31st, made at a meeting of the stockholders held on the 8th inst.:

Table with columns for Receipts (Bullion account, Mill account, Mine account, etc.) and Disbursements (Book account, Mine expense, etc.) and amounts.

The real liabilities of this company at present amount to \$10,423 56. During the fiscal year ending Oct. 31st, 11,828 tons of ore were worked, and 3,364 1/2 tons sold, showing an average yield of \$15 67 1/2 to the ton. The losses of mining and milling have been \$53,638. The following officers were elected for the ensuing year: A. E. Head, President, in place of Geo. W. Stewart; Geo. W. Weaver, Vice President; R. E. Morrow, Wm. S. Head, and F. Livingston, Trustees; A. Wegener, Secretary; Chas. Foreman, Superintendent.

IMPERIAL—is in good favor, and has fluctuated very little, advancing from \$125 to \$138, receding to \$130, and closing at \$136 seller 30. The bullion returns for October aggregate \$68,397 94 against \$97,980 in September. EMPIRE—continues to be firmly held, a few shares selling at \$170. Receipts of bullion during the month of October foot up \$20,579 48; in September the returns amounted to \$18,689 40. Nothing of special interest to report. It is believed that the machinery at the Imperial-Empire shaft will be started within a week or so.

GOLD HILL QUARTZ—is dull of sale, a few shares realizing \$80. It is indisputably believed that the expenses will be considerably reduced during the present month, and that the bullion yield will be larger. It is expected that the 450-foot level will be reached very soon. The 150-foot level continues to yield a few tons per day, but will soon be exhausted. The 290-foot level, it is thought, will last during the present month; it produces a fair quality of rock.

OTHER—sold at \$50@60. The shaft is now 98 feet in depth, and the water continues to decrease. OVERMAN was in the market at \$44@41, closing yesterday at \$45. The receipts of bullion in October amounted to \$34,000, against \$29,000 in September. Since the 1st inst. the receipts have been about \$3,000.

The aggregate sales of Stocks, Legal Tender Notes, etc., at the regular sessions of the Board since Saturday last, amounted to \$937,395. The sales in the open auctions amounted to \$228,333, showing a combined aggregate, including the past week of 215,73.

ESTABLISHED [MAY, 1860.] VOLUME FIFTEEN — OF THE — Mining and Scientific Press, COMMENCING JULY, 1867. DEWEY & CO., Publishers. Issued every SATURDAY, at our Book and Job Printing Office, 505 Clay street, corner of Sansome, SAN FRANCISCO. Terms in Advance—One year, \$5; Six months, \$3; Single copies, 12 cents; Monthly Series, \$5.50 per volume, or 65 cents per number. Back Volumes from January, 1864, \$3 per volume; bound, \$5 per volume. THE MINING AND SCIENTIFIC PRESS is now thoroughly established, and enjoys one of the largest and most permanent subscription lists of any weekly journal in this coast. The individual character and reputation of its constant patrons throughout the entire coast is one of the best recommendations of its merits and value as a medium of intelligent progress and prosperity. DEWEY & CO., Proprietors, Mining and Scientific Press Patent Agency, Newspaper, Book and Job Printing Office, 505 Clay street, San Francisco.

Fluctuations in Leading Mining Shares for the past Six Months.

Table with columns for Name of Company, May 10th, May 20th, May 30th, June 10th, June 20th, June 23rd, July 10th, July 20th, July 30th, Aug. 10th, Aug. 20th, Aug. 30th, Sept. 10th, Sept. 20th, Sept. 30th, Oct. 10th, Oct. 21st, Oct. 30th.

MINING SHAREHOLDERS' DIRECTORY.

Table listing prices for various metal products and materials, including iron, steel, and copper.

THE AMERICAN TUBE WELL, which has already been described in this journal, has been introduced into England, where it is said to be meeting with great favor.

Valuable Books on Mining, Mineralogy, Geology, Metallurgy, Etc.

Table listing various books for sale, including 'ANSTED'S Gold Seekers Manual', 'ANTISELL—The Manufacture of Photogenic or Hydro-Carbon Oils', 'BLAKE, W. P.—Geological Reconnaissance in California', etc.

AN INSTRUCTIVE BOOK!

Prof. LAYRES' ELEMENTS OF COMPOSITION, BELLES-LETTRES AND ORATORY. For Scholars, Teachers, Lawyers all Professional Persons, and those of Common Education, who would improve the Eloquence and Effectiveness of their Composition and Manners of Address.

Price, postage paid, \$1.10

This is a new publication, and in style and treatment of this important subject, is original, simple, plain and comprehensive. The author, Prof. LAYRES (a meritorious Teacher of good standing in California, and a sound thinker and reasoner) in his preface says: "The method pursued by the Author in developing the subject of Composition, is both the synthetical and analytical. The former is necessary to teach the theory, the latter the practice of the art; and as these are both indispensable to the scholar, so are also the two methods, as the sequel will show."

## Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

## CALIFORNIA.

## Alpine County.

*Miner*, Nov. 2d: The Merrimac mine continues to exhibit rich ore wherever tapped along the course of the tunnel. Some samples have been taken out, during the past week, of a favorable character, and Mr. Ray will thoroughly test the lode.

Ore has been taken from the Morning Star mine which contains considerable metal, and some which assays as high as \$40 to the ton.

Good ore is being taken out of the Tarshish mine at several points, and five bars have been shipped from the Silver Creek mill, the product of 30 tons of this ore, worth about \$2,500.

## Amador County.

*Ledger* November 2d: The Italian mine, Soracco Bros. & McLane, yielded \$35 to the ton the last run.

The Amador Canal Co. is replacing several miles of its ancient flumes by ditch.

The fine quartz mill, erected by John Atchison, at the Gate, has been taken down and moved to the Oneida mine, and will, in a few days, be ready for operation.

Billy Boyle and Dick Lowry cleaned up their arastra, on the Middle Fork, last week, and found that their ore had paid \$54.15 per ton.

The Union Mine is now down 30 ft. below the original shaft, and will be continued 30 ft. further; making the main shaft over 300 feet in depth. The mine seems to be slightly improving.

Last Sunday the owners of the Kentucky mine cleaned up a run of 150 tons, which yielded the sum of \$3,445.85. The rock was worked in Tubbs & Co's mill, at the Gate, and nothing but free gold was obtained—the sulphurets were saved but not worked; they are known to be very rich.

The Alturas Quartz Co. have their mill ready for operation, and will start it as soon as they can get a stream of water into the batteries.

Monday night, one of the boilers and smoke stack intended for the Coney & Bigelow mine, was received, and will soon be placed in its proper place.

## Butte County.

*Marysville Appeal*, Nov. 5th: We were informed on Saturday, by a gentleman who saw the gold, that George Seiler, of Yankee Hill (near Forbestown), picked up one day last week a nugget of pure gold weighing three pounds.

## Calaveras County.

*Chronicle* Nov. 2d: Thirty-three tons of rock taken from the quartz lead owned by Mr. T. S. Bever, at Rich Gulch, by the lessees, Messrs. Cole & Sheldon, paid \$10 per ton. The rock was taken out the entire width of the lead, and was unassorted.

*Register*, Nov. 2d: At Cat Camp, the newly discovered mining region at the tail end of our county, everything seems prosperous and encouraging. The mew-sic of the carpenter's hammer is heard in every direction, and people as lively as mice are spinning around in close pur-suit of what they—most desire, with a fair prospect of gaining—gold.

The Chucbee correspondent says that most of the mining claims in that locality are worked out. Only a few remain, and another season or two will finish them.

## Kern County.

*Havilah Courier* Nov. 2d: A rich strike has been made in the Mountain Queen lode, Washington district. The mine is worked by Emory Bros., who are down 80 ft. in their main shaft, where they have found rock which exceeds in richness anything heretofore obtained. The vein is about 12 inches wide. The yield of rock is from \$75 to \$100 per ton.

## Klamath County.

*Yreka Union*, Nov. 2d: It is reported a very rich lode of copper has been struck on Red Cap Creek, near Orleans Bar, Klamath county. Parties have been prospecting for the lode since 1863.

## Mariposa County.

*Gazette*, Nov. 2d: The Hunter's Valley correspondent writes that Robinson's new mill started on the 18th, and everything works admirably. The copper croppings, even, prospect well in gold.

Floyd's mill has had a long rest, and will likely rest awhile longer.

Carson's mill has been running on rock from Woolcox & Johnson's mine, in the Gimissal. It costs \$12 per ton for hauling and crushing. Last week Carson made a run of a few tons from their own vein, which paid about \$600 per ton. About a month since the rock paid \$800 per ton.

The Richards vein is said to pay well, so also the Lafayette mine.

*Mail*, Nov. 2d: Page, Dyer & Co., at Hornitos, are doing a fine business. They are working on the Washington vein, near Quartzburg, and hauling their ore a distance of four miles, to the old French mill. This company are putting up machinery for working the sulphurets, and when completed they expect their ore to yield \$125 per ton. They contemplate moving the mill to the mine in the Spring.

## Nevada County.

*Gazette*, Nov. 1st: Nine tons of quartz from a ledge lately discovered near Shelby Flat, crushed at Murchie's mill, was cleaned up yesterday, and yielded a little over \$200. The ledge is small, but where they are now working two men are taking out five tons a week, and to the depth reached there is no water to interfere with working.

The bullion shipments from Grass Valley in the last ten days, have amounted to \$92,000—principally the product of the quartz mines.

Nov. 2d: Black & Young; Commercial and Birchville mills, as well as the arastras of Booth & Co., at Eureka, are running steadily, and all doing a good business; also every ledge in the district which is being worked, is paying more than expenses, while the most of them are yielding good profits. The Birchville mine, especially, is looking finely, improving in quality of rock and size of vein the more it is opened.

Nov. 4th: The Dromedary and Ophir mines, at Grass Valley, are now yielding large quantities of specimen rock. The amount taken out of the Dromedary, within the past week, it is said will not fall short of \$5,000. The Ophir is also said to be paying better than ever before.

*Grass Valley National*, Nov. 4th. The Allison Ranch Co. has been engaged since February last in grinding the accumulated tailings of the mine since its commencement, and expect to have them all worked over in about two weeks. They have in operation 16 grinding pans, which work over about 40 tons per day—and clean up from \$1,500 to \$1,800 a week.

Very few are aware of the large number of quartz ledges now lying unprospected. As an instance—from Rocky Bar mine on Massachusetts Hill, running south less than a mile and a half, in a district bounded by New York Hill and the Auburn road, there are not less than 18 known leads. Of these but two are being worked by machinery—New York Hill and North Star, and work being done occasionally on one or two of the balance.

**EXCELSIOR.**—*Meadow Lake Sun*, Nov. 2d: The Kentucky Co. are driving their work ahead with great vigor. The lower tunnel is now in a distance of 68 feet, and the shaft which is being sunk from the surface above to connect with the tunnel, is down 20 feet. They are now erecting a house over the shaft in order to protect the workmen from the inclement weather of winter. The work is prosecuted night and day.

*Virginia Enterprise*, Nov. 1st: The new roasting furnace of the Enterprise Co., Excelsior District, is completed, and the mill will be in about a week. It is a five-stamp mill, and, from the soft nature of the ore, it will crush about 15 tons per day. The engine is powerful enough for 10 more stamps, which will be put in next Spring. Crushing will be commenced some time during the present month. The company have 400 cords of wood at the mill, together with plenty of ore, and everything will soon be in readiness for a steady and successful winter's run.

*Dutch Flat Enquirer*, Nov. 2d: The Mohawk mill at Meadow Lake recently cleaned up \$12,000, the result of 50 tons of rock crushed at their mill.

## Placer County.

*Auburn Herald*, Nov. 2d: McGonigle & Co. still continue to be successful in taking out gold on the Black Ledge. The company took out gold enough last week to build a five-stamp mill, and will proceed to erect one as soon as they can make the proper arrangements.

Messrs. Lyon Spear are pushing their work on the old Buckeye Ledge, and are now having a lot of their quartz crushed at Pugh's mill, at Ophir.

The Ophir Co. have sued the Good Friday Co. for jumping a portion of the Ophir ground.

Cahill & Co. are prospecting their work on the Black Ledge as fast as possible. They are sanguine of striking something very rich in the next 20 ft. Peter Walter's claim continues as rich as ever. He had pounded out in a hand mortar last week, in a day and a half, by one man, \$1,500. And still the quartz holds out as rich almost as ever.

The Hagan mill, near Ophir, which was burnt down some time ago, is now being re-

built, and will soon be ready to be crushing quartz again.

Dake & Co. are running their arastra and working their quartz out of a claim, which is located between Auburn and Ophir.

A five-stamp mill has recently been erected on the Webdell mine.

*Auburn Stars and Stripes*, Oct. 30th: The Black Lead is paying more richly than ever. \$500 to the pan was washed out several times last week. There seems no end to the deposit, no limit to its richness, and yet no end to the improvement as the parties advance with their work.

The Peter Walter claim is also bolder out remarkably well. Although they have found no masses of gold requiring the cold chisel, sheets of quartz and gold have been taken out, in which the gold largely predominated. The "rich streaks" on this ledge are wonderfully rich, and any just description of them would be pronounced or believed to be a fable.

## Santa Clara County.

*San Jose Advertiser*, Nov. 2d: Recent discoveries in this neighborhood indicate that vast quicksilver mines abound in this valley. Many well defined veins of copper sulphurets have been discovered in the same range of hills in which cinuabar is found; and whenever capital and labor are judiciously applied, there is little doubt that our copper interests will compare favorably with those of Calaveras county, or any other copper mines in this country.

## Sacramento County.

*Folsom Telegraph*, Nov. 2d: The Union Cement Co. held an annual election at Folsom on the 31st of Oct. Their claim is situated near Placerville with rich prospects, and the Co. design the immediate erection of a mill upon their claim.

## Shasta County.

Parties from San Francisco have purchased Ludwig's water ditch, and taken up quite a tract of mining land in the immediate vicinity of Piety Hill, and are making preparations to inaugurate an extensive mining enterprise during the coming winter. The land taken up embraces what is known as the Hardscrable diggings, and is known to contain gold in paying quantities.

## Sierra County.

*Downville Messenger*, Nov. 2d: Some gentlemen from Nevada have purchased the Old Craycroft diggings on the North Fork, and dug a ditch about five miles long for the purpose of bringing in water.

Parrott & Co., of San Francisco, have bought the old Seventy-Six and the Roubt and Ready claims on Jamison Creek, near the Eureka mills, and are about to put up machinery and works of sufficient capacity to work them to the best advantage.

The Docile mill, near Alleghany, will be ready to crush ore in a few days.

P. A. Lamping is getting ready to work the blue banks near the bridge above town by hydraulics.

A rich discovery has been made in the Union Hill Co's claims. This company have been working for four or five years in red gravel, with moderate success, and the discovery of the blue gravel was the result of an accident. The blue lead, where they first struck it, was only a few inches wide, but at the distance of 25 ft., where they now are, it is 4 ft. in width, and prospects from five to six colors to the pan, said colors varying in size from a pin head to the size of a finger nail. The bed rock is soft and easily worked.

## ARIZONA.

*Miner*, Oct. 12th: Poland & McCrackin, Uncle Billy Pointer and others have rented the Thunderbolt mill and arastra at Walker's on Lynx Creek, purchased and hired teams, and on Monday will commence hauling and crushing ore from the Deadwood No. 2, the Pointer and other good lodes on Eureka Hill. It is not their intention to keep the mill running permanently, but only to crush a few tons from each lode to "raise a stake" for the winter.

Hardy's mine in San Francisco Dist., Mohave county, is looking better. Plenty of good rock is being extracted, and arrangements are being perfected to have it crushed at the Moss mill.

San Bernardino *Guardian*, Oct. 26th: The Wickenburg mill will soon be ready for work. There will be added five stamps to its former three.

Mining operations are to be carried on in the Williams Fork copper region with renewed energy.

The owners of the Great Central Mining Co. intend to put on additional force and push the work along. There are 100 tons of ore on the banks of the river waiting transportation.

The Planet mine, on which work has been suspended, will soon be opened up again.

## COLORADO.

*Georgetown Miner*, Oct. 17th: We saw at the works of Garrott, Martine & Co. a

day or two since, a ton of closely selected ore from the W. B. Astor lode. They commenced crushing this ore on Tuesday last.

The shaft on the Hunkadora lode is down 50 ft., the crevice being five ft. wide, with a two foot ore vein of rich sulphurets of silver and argentiferous galena.

Mining is being actively prosecuted upon many of the lodes in this district. A large amount of ore is being raised, and nothing prevents large bullion shipments but the want of works for reduction.

The Nuckolls lode is being actively worked and a large quantity of first class ore is being raised to the surface.

The Young America lode in Downville Dist., is being actively developed, and shows the finest vein of silver ore in these mountains. The accessible position of the lode is far ahead of any yet discovered.

There was, at the Fair in Denver, a fine lot of copper ore from the Partridge lode. The lode is situated on North Boulder, and has a 12-ft. crevice with a solid vein of ore seven ft. wide. The ore shows considerable quantities of native copper; and assays from 60 to 85 per cent. of its weight in that metal.

Among the many new and rich discoveries made the present season, is the Silver Eagle lode on Republican Mountain. The lode has permanent, smooth walls, a crevice of between five and six feet, with a 15-inch ore vein of sulphuret of silver, that assays from \$1,200 to \$2,000 in silver to the ton of ore.

Our bullion report for the week is as follows: Garrott, Martine & Co. 972.3 ozs., coin value, \$979.46, currency value, \$1,273.29. Dr. Johnson bullion to the amount of \$500 in coin, currency value, \$650. Total coin value, \$1,479.43, currency value, \$1,923.29.

We have just been shown some very fine specimens of ore from the Rainbow lode. The ore, principally argentiferous galena, assays \$1,600 per ton. Besides the galena, the vein carries some very fine and almost pure white quartz intermingled with iron and copper pyrites.

While in Denver the editor saw some fine specimens of gold bearing ore from the Nettie lode.

Denver *News*, Oct. 23d: Mr. A. D. Cooper this morning showed us 44 ozs. 9 pwt. of silver bullion which was taken from 12 lbs. of ore from the W. B. Astor lode at Georgetown.

Col. W. H. Fry has bought the interests of his partners, Messrs. McGlashen & Tomlinson in arastras, and the Tip and Tom lode.

*Times*, Oct. 23d: While some miners were sinking a shaft on the May lode below Black Hawk, they came on a vein about 10 in. wide, of some of the richest silver ore that has ever been discovered in these mountains. The mine is the property of Mayor Teats, who took a chunk of the ore to the Excelsior mill. Mr. Reese looked at it, and immediately said that it contained large quantities of chlorides of silver, the first he had seen in any specimens of Colorado ores. He scraped a little of it on to the point of a knife, and bringing the blowpipe to bear on it, soon developed the pure silver. The chlorides are scattered through the ores, in places running in seams of an inch or more in width. They contain 80 per cent. of silver, and the large piece of ore, weighing several pounds, will, every bit of it, go as high as \$1,000 to the ton. Besides the chlorides, it contains sulphuret of silver and green carbonate of copper.

At Warren Hussey & Co's bank, we noticed a lot of scale gold, weighing 72 ozs., taken from the Spanish Bar diggings, on Clear Creek. It is worth nearly \$18 in coin per oz., and resembles the gold from Tarryall Creek in quality. The largest percentage of gold and silver yet saved by the "California process" was obtained yesterday from four tons of Gregory ore. Its value per assay was \$50 per ton, and the parcel yielded after treatment, \$182.08, being 91 per cent. of the assay. We were shown a gold bar, from the mill of Krause, Reese & Bruckner, bearing the following inscription: Ounces, 38.90; gold, 0.700 fine; silver, 0.290; value \$506.60. This was taken from a lot of 17 tons Pebabic ore, and is within 88 per cent. of the fire assay.

## IDAHO.

*World*, Oct. 26th: The Malheur diggings are reported to be deep, quite extensive, and to pay fair wages.

*Lewiston Journal*, Oct. 17th: About 30 tons of ore has been taken from No. 1 East, of the Hie Jacet, which is of an excellent quality. The lead has increased in width.

No. 1 ore is being taken from the Winfield Scott.

## MONTANA.

*Post*, Oct. 19th: Messrs. Bohm & Molitor received two lots for assay recently—one 205 ozs., 9½ pwt., the other of 260 ozs. 5 pwt.—of which the first lost but 1½ per cent., and the second lot lost below three

per cent. The L. X. L. Co. turned out the first and the Philadelphia Co. the second lot.

The Turnley mill is again in complete repair, and is now running.

A gentleman just arrived from Flint Creek says the S. L. & M. Co. started the entire machinery of their mill for day and night running on the 17th inst. The pans were charged with 3,500 lbs. of quicksilver. From 100 lbs. of average rock, by the same process as that employed in the mill, \$12 were obtained. The ore it is believed will equal or exceed this yield. The crushing capacity of the mill is 15 tons per day.

The St. Louis & Montana Co's mill has started up.

There is on exhibition in the window of Weir & Popo's drug store, some of the richest specimens of gold bearing rock we have seen for a long time. It was taken from the discovery claim of the Esmeralda lode at the head of Deadwood Gulch. The rock is of a dark brownish color interspersed with a little white quartz and literally covered with gold. There has been nothing seen like it since the discovery of the Uncle Sam in 1865.

#### Humboldt.

#### NEVADA.

The Dun Glen correspondent of the Unionville Register of Nov. 21, says: The Monroe and Essex mines are still being developed, and the precious metals daily being extracted. A specimen of the Monroe rock being furnished me yesterday, not only surprised but astonished me to such a degree that when asked this morning by Mrs. Jeems, what I would have for breakfast, I meekly answered, "a little Monroe rock."

There is quite a settlement gathering in and around the Essex mill, one mile from town. The mill will be completed by the 1st of December. It is proposed to name the settlement "Bellview."

The same paper says: We were shown this week several hundred pounds of very fine looking ore from Battle Mountain. It would be hard to separate this ore from the ore of Gold Run Dist., if mixed with it, as the ores are very similar in many respects.

The Arizona ledge is strong three ft. wide and contains the richest quality of ore, which keeps the mill constantly at work.

#### Reese River.

Reveille, Oct. 28th: Arrived, 2,400 ozs. of bullion from the mill of the Social and Stepote Co. at Egan Canon; also 2,000 ozs. from Coover's mill at Bunker Hill Dist.

The California mill, last week, worked some of the richest ore ever produced in the district. Two tons of first class ore from the Great Eastern mine yielded \$1,210 per ton by assay of the pulp. Ore of the second class—which is the principal quality sent to mill—yielded \$354 per ton; and that of the third class, of which only a small quantity was worked, yielded \$80 per ton. The small batch of richest ore puzzled the amalgamators somewhat. The pan was charged with half a ton of pulp, and only 300 lbs. of quicksilver, and after a few revolutions the pan became clogged by the stiff mass of dry amalgam, which had reached the consistence of a bank of clay. The proprietor perceived the difficulty at once, and the pan was thrown out of gear, and 600 lbs. of quicksilver were added to liquify the solid mass. With the additional mercury—the whole amount of quicksilver being about 22 times greater than the silver—the amalgamation went on successfully to the end.

This morning, 7,000 lbs. of ore from the Fisherman ledge, of the Bullion Co., in the Reveille Dist., passed through the city for the Metacom mill where it will be reduced. A glance at the ore showed the greenish and purplish horn silver which abound in the mine.

This morning J. S. Currie, assayer showed us several large samples of gold-bearing quartz, which yielded by assay at the rate of \$500 of gold per ton. The ore exhibited only a trace of silver. It is singular looking quartz, of grayish white color, with faint tints of green and pink, and is entirely different in appearance from the general gold-bearing quartz of this State or California. The person who brought the ore to the assay office declined to give information of the locality whence it was obtained other than that it was found about 20 miles south-east of Austin.

Oct. 31st: Two furnaces are being added to the mill of the Old Dominion Co. at Hot Creek, which, when completed, will develop the full capacity of the works. With only two furnaces, \$11,000 were produced in the first month's running of the mill, which was not covered in and was stopped for several days by snow storms. The mill is well supplied with ore from the district, as well as from the districts of Morey, Danville and Reveille. Its Old Dominion mine is developing finely in the greater depth attained, and the foreman of the work is quite confident that with a start of only 90 days in

opening the mine, he would be able thenceforward to supply the mill steadily with ore.

Nov. 1st: The Fisherman ledge of the Bullion Co., Reveille Dist., continues to produce ore of a high grade. The 7,000 lbs. reduced at the Metacom mill yielded \$420 silver per ton.

There were shipped from this city through Wells, Fargo & Co., during the month of October, 223 bars of bullion, weighing 15,075 lbs., and valued at \$223,075.58.

Nov. 2d: Peter Brandow is successfully working the Yosemite mine of Santa Fe Dist. A ton and a half were brought to this city and worked at the Manhattan mill, producing at the rate of \$216 per ton. The vein is now six ft. in thickness, and all bearing ore of fine quality.

A number of mines in Reveille Dist. are producing ore for transportation to Hot Creek for reduction. The Atlantic and Mediterranean ledges of the Reveille Co., are yielding ore, which is estimated to give \$150 per ton. The owners of a ledge called the Davis are working in with much energy, and the ore which they have taken out shows largely of horn silver; they expect heavy returns from the first working in the mill. The Amazon ledge is also producing fine ore. Brobant & Co. are stirring among their ledges on South Mountain, and are extracting ore for the mill at Hot Creek. The Bullion Co. is engaged altogether on its Fisherman ledge. The ore produced by the mine is of a remarkably high grade; for instance, three-quarters of a ton which were reduced at the Keystone mill near this city, yielded at the rate of \$1,647 per ton; and several lots of several tons each have been worked here since which yielded from \$300 to \$714 per ton. We have before us a certificate from the superintendent of the Old Dominion mill at Hot Creek, which gives the result of the working of six tons of second class ore at \$175.35 per ton.

Silver Bend Reporter, Nov. 2d: Nearly 4,000 ozs. of bullion were received at Austin from the Knickerbocker mill, near Inone, on Friday of last week, and upwards of 4,000 ozs. from the mill of the Old Dominion Co. at Hot Creek.

Ten tons of ore from the Buckeye mine, in Summit Cañon, North Twin River Dist., worked in the Twin River Co's mill at Ophir Cañon, gave a pulp assay of \$300 per ton.

Three and a half tons of ore were recently sent from the Fisherman ledge, Reveille Dist., to Austin for reduction. It was taken to the Metacom mill.

Coover's little mill in Bunker Hill Dist. is now doing a fine business, if we can judge by the shipments of bullion therefrom to Austin.

The following is the yield of some of the principal mines in Lander county during the last quarter: Manhattan, 760 tons yielding \$251.20 per ton; and 9½ tons yielding \$284.59 per ton; Mt. Tenabo, 527 tons yielding \$63.32 per ton; St. Louis, 107½ tons, \$182.14 per ton; Diana, 82 tons, \$209.40 per ton; Buel North Star, 68½ tons, \$230.05, and 21½ tons, \$158.56 per ton; Timoke, 52 tons, \$292.31 per ton; Florida, 62½ tons, \$199.37 per ton.

Virginia Enterprise, Nov. 2d: The following well known gentlemen, all mining experts, have purchased seven-twelfths, or 700 ft. in the Wheeler mine, situated in Pine Grove, Wilson Dist.; Gov. Blasdel, Capt. Cheever, Capt. Pray and Mr. Todman. The parties purchasing are the owners of a 10-stamp mill, situated about three-quarters of a mile from the mine. The price paid for the 700 ft. of ground was \$10,500. Mr. Wheeler retains five-twelfths, or 500 ft. of the ground included in the mine. The mine is of gold-bearing quartz and is one of the most promising "outside" mines in the State. At present a tunnel is being run for prospecting purposes, lengthwise of the ledge, at a considerable depth, by Goodrich & Co. who do the work for a certain proportion of the ore taken from the tunnel. The width of the lead where they are at work is not known, but the whole tunnel is in paying ore.

#### Washoe.

Virginia Enterprise, Nov. 2d: Wells, Fargo & Co. shipped from their offices in Virginia City and Gold Hill, during the past week, 5,972 ozs. of assayed bullion, valued at \$129,852.39.

Parties have lately retimbered the shaft of the old Milton mine. It is said that much paying ore can be obtained in the Milton, the works of which, with timbers of the shaft, were destroyed by fire some two years since.

#### OREGON.

Jacksonville Sentinel, October 26th: The Crandall copper mine has been prospected this summer, and found to be rich in both gold and copper.

The Umatilla paper says: Our friend Me-Bicker, showed us on Wednesday 25 ozs. of Columbia river gold, the result of one week's work, with seven men.

[Written for the Mining and Scientific Press.]

#### Notes on the Mines of Cerro Gordo.

EDITORS PRESS:—I am pleased with these mines. On the whole I decidedly prefer them to those of the Kearsarge district. It is true that, in the latter, I have met with richer ores; but they do not appear to exist in sufficient quantity, while in Cerro Gordo the accessibility of the mines, and apparent abundance of paying ore, give promise of a flourishing mining country, the only important drawback being the scarcity of water, which will probably be found in sufficient quantity for steam mills so soon as tunnels are run into the mountains. Meanwhile the ores are being worked to a small extent by smelting at the mines, by patio process at a spring on the shore of Owen's Lake, and by pan process at the Silver Sprout company's mill in the Kearsarge district, forty miles from the mines.

I visited quite a number of veins, of many of which I took what I considered fair samples for assays, the results of which I give, together with my notes as made on the ground:

The *San Lucas* is the only mine in the district which is opened to any extent, and actively worked. Depth of shaft, 60 feet; width of ore at this depth, 2½ feet. The vein is eight inches wide at the surface, traced 1,800 feet under different names; course nearly east and west; character of ore cupreous, contains stetefeldtite, carbonates, and sulphide of copper, and a little galena; gangue quartz interspersed with streaks of carbonate of lime; ore assays \$250 per ton.

*La Esperanza*—About four inches wide; not open.

*San Pascual*—Similar to the preceding; the ore is good in both.

*La Principia* or *El Principio*—Eight inches wide at ten feet in depth; ore good.

*Santa Maria*.—There is a shaft on this vein, but it is closed. The ore is galena; the vein is said to be fourteen feet wide.

*Union*.—Galena in a mass of limestone debris; no defined vein. This mine is open to the public, and is resorted to by the Mexicans to procure lead with which to smelt the cupreous ore. The galena is said to yield 20 per cent. of lead and forty ounces of silver per ton.

*Buckingham*.—Galena in limestone; no defined vein; assays \$45 silver to the ton.

*Portuguese*.—Ore cupreous and very good; from a width of two feet, near the top, it gradually pinches out.

*Metallic*.—A heavy vein; course nearly N. and S.; ore contains copper and lead; sample of croppings assay \$45.

*Buena Vista*.—An immense vein, visible twenty miles off. Well named for the magnificent view it commands, embracing Owen's river, lake and valley, backed by the granite peaks of the Sierra Nevada. This vein crops out twenty-five feet wide in a straight line almost continuously for half a mile; course nearly N. and S., and shows mineral in several places; assay of sample of croppings gave \$35 silver per ton. A contract has just been made to sink twenty feet—a mere flea-bite for such a vein. This ledge is worthy the attention of capitalists.

*Hahn*.—Vein four to six feet wide; shows good ore.

*Buena Suerte*.—Vein lies very flat, and not very well defined, 1½ foot wide; sample assay, \$130 per ton.

*Belmont*.—Nine inches wide; \$100 per ton.

*Schiller, Goethe and Richter*.—Small veins; \$250 per ton. I am informed that since my visit the Schiller has opened to six feet wide.

*Bismarck*.—Another immense lode, crops out twenty feet thick; shows some good mineral. Below is a valley forming a pass to the lake, on the east side of which a road might be made connecting with that to Los Angeles, but the ground is said to be sandy. Plenty of wood here, but no water, yet.

*Escondido*.—I have seen some fine ore from this vein. Many of these ores contain a little gold.

The ore of the *San Lucas* may be taken as a type of all, except the galenas; which latter, so far as my observation goes, are not very rich in silver, that metal appearing to be usually associated with copper in this district. There are many more veins located which I did not see. Select lots of ore yield from \$400 to \$600 per ton by smelting. With the exceptions noted, none of these veins are opened, and there is no good reason to doubt that many of them will prove as good as the *San Lucas*, which is a very nice little mine at present. The smelting of these ores has been, so far, accomplished exclusively by Mexicans and Chileans, who, in such a country as this, will often do more with a rawhide and a batch of mud, than we, with all our wealth and science—a fact from which a hint might be taken by many, who, while boasting of their rich mines, are starving on beans, and waiting for "capital."

From Owen's Lake to these mines, there is a good natural road most of the way, which could be made passable for wagons with but little expense. The distance is about seven miles, and the ore could be carried across the lake in launches to the west side, where wood and water abound.

I am not a geologist, but cannot forbear remarking the great contrast between these mountains and those which bound the valley on the west. There they are lofty, abrupt, granitic, snow-capped. Pine trees and manzanita flourish in the ravines, from which flow crystal streams of snow water. Here the slope is more gradual, the aspect less majestic; though scarcely more dreary. Water, there is none, except a very few springs, brackish or sulphurous, which issue from the parched ground near the borders of the lake. Nut pines abound on the eastern side of the range; but on the western, sage brush and bunch grass are almost the only vegetable productions. The rocks encountered in the ascent are, after passing the debris at the base, first, slates of various kinds, some of them ferruginous, whose bright hues, with the white and yellow of the calcareous strata higher up, mitigate, in some degree, the monotony of the scene. Next comes limestone, both white and blue, in vast masses. In this formation most of the richer ores have been found, though some of the larger veins are in the slate. Beyond the summit, on the eastern slope, where the great Bismarck appears, is feldspathic granite. As with the Sierras, though in less degree, the eastern side of the range is abrupt, while the rock assumes a granitic character; and, as the next range presents the same peculiarities, the idea is suggested, that the corrugations or upheavals at this point, have taken place along meridional lines, in a step-like form, the line of fracture being on the east side of each range.

Owen's Lake is not a pleasant piece of water. It looks well enough at a distance, but a closer acquaintance develops disagreeable features. In the spring its shores exhibit winrows of those disgusting larvae which abound at Lake Mono, and now, myriads of equally disgusting flies, at once the parents and the offspring of the grubs, cover the water to a great distance. A fetid, sickening odor pervades the air, and the scene, with the dark desolate mountains of slate bounding the eastward view, carries the imagination back to the time when ichthyosaurs, and other hideous, scaly monsters chased each other through the reeking atmosphere and seething waters of a half-made world. The water of this lake is said to have the property of tanning a hide in a day. I took a bath in it, on my return from the mines, and was quite satisfied on that point. I shall pursue my investigations as opportunity offers; but my next experiment with this water will be conducted with my clothes on.

Talking of monsters, some large bones have been found in the river bank, near Bend City. They were discovered at a depth of sixteen feet. Only a few were exhumed, and those somewhat damaged, although it appears that the whole skeleton may be obtained. The bones are those of a herbiferous animal. The remains of a large cedar tree were also found. C. H. A. Kearsarge, Inyo Co., Oct. 18.

ANOTHER HERMES.—A citizen of Washington claims that after devoting years to the subject of aerial navigation, he has perfected a plan by which he can transport passengers and mails from Washington to New York in three hours. All he now requires is money.

A RICH MINISTER.—The pastor of the Second Presbyterian Church at Troy, N. Y., is said to be the richest minister in the world. In his own name he counts \$5,000,000; his father is worth \$3,000,000; and his wife \$5,000,000. His salary is \$4,000.

POSTMASTERS are requested to punctually inform us of the removal of subscribers of the Press from their locality, or of neglect to take the paper out of the office from any cause—when the subscriber omits that duty himself. It is not our intention to send this journal to any party longer than it is desired. If we inadvertently do so, subscribers and others will please inform us.

## Canvassing Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. Jan. 11, 1866.

Dr. L. G. Yates is our duly authorized traveling agent. July 6, 1867.

Mr. A. B. Butler is a duly authorized traveling agent for this paper. July 15, 1867.

Mr. H. C. Northrop, is our duly authorized agent for Oregon, Washington, Idaho, and Montana. Aug. 17.

## San Francisco:

Saturday Morning, Nov. 9, 1867.

## Notices to Correspondents.

A FENIAN.—If not able to grant more material aid to down-trodden or oppressed nationalities, such will always command our warmest sympathies. Before, however, attempting to revolutionize a country, the feasibility of success ought to be well weighed; a Quixotic attempt can only result in disastrous consequences to the parties implicated, and also to those attempted to be served. Compared with the magnitude of the attempt, the abstract which you have forwarded of the forces and material available, is puerile in the extreme. Still more silly is the programme sketched forth by President or Head Centre Roberts, by which he has attempted to delude his followers and wheedle them out of their hard-earned gains by inducing them to believe that he expected aid from "advanced Italy." Either excessive ignorance or the most brazen impudence must have given birth to such an idea. Mazzini is known to be the leader of "advanced Italy," whose settled principle, as well as that of Garibaldi and his followers, is to drive the Pope out of Rome and all territorial power in Italy. Yet, in opposition to the desires of these well known liberal leaders, that section of the Irish of which the Fenians are solely composed sent one or more regiments of volunteers to assist the Pope in maintaining his position. "Advanced Italy" and Fenianism are as opposite as fire and water. The Irish women of New York are the only portion of the Fenians who have shown common sense, denouncing, as we also believe the movement to be, under existing circumstances, merely a dying effort to extort from honest enthusiasm the means for supporting lazy bummers in luxury and idleness.

JUVENIS expresses a strong desire of making himself not only thoroughly conversant, but also to obtain practical efficiency as a metallurgist, believing, as he does (and we consider justly so), that it is only by means of such that our exhaustless mineral riches will ever be developed to the extent which they ought to be, and at the same time be remunerative to the explorers. In the absence of any public schools of instruction specially devoted to the subject alluded to and the cognate sciences of geology and chemistry, we can only commend to our young friend the purchase and earnest study of the most recent and best works relating to such matters. These may be selected out of the long list which we weekly advertise. After such are secured, careful, serious and indefatigable study is required at all hours not occupied with some of the essential duties of life. Master every principle as you proceed, no matter how slowly. An example of what perseverance can do will be found in our last week's "Notices to Correspondents," in the case of Nicholas Breakspeare, the only Englishman who ever wore the triple crown. Do likewise. At home you may learn much calculated to greatly facilitate future practical knowledge by chemical experiments on a small scale; but real practical ability can only be acquired by being some time occupied in metallurgical operations on a working scale. Eventual success will be the undoubted reward of steady industry and indomitable will.

## New Mill in Hunter's Valley.

A new quartz mill, owned by L. L. Robinson and Hall McAllister, of this city, was completed and started about two weeks since on the Oaks and Reese vein, in Hunter's Valley, in Mariposa county. The engine and machinery for this mill were turned out at the Union Foundry, in this city, and it is considered one of the best constructed and best arranged mills in the State. The battery consists of twelve 600-pound stamps, driven by an engine on which has been placed one of Scott & Eckart's patent cut-offs. This new cut-off seems to be meeting with much favor. It is said to work with very little friction, and, by its economical use of steam, to effect a most important saving in fuel. We propose, at an early day, to give a full description of this invention, setting forth its precise advantages, with the practical details of its work, obtained from parties who are using it.

The engine at this mill has a 12-inch cylinder, with a 24-inch stroke. In addition to the twelve stamps, dropping seventy-five times per minute, it also drives a seven-inch Cornish pump, raising water 160 feet, with a six-foot stroke, and hoisting works, with three reels, five feet in diameter and three feet wide. The hoisting works are situated 360 feet from the main building, the steam being conveyed that distance in a steam-pipe.

The mill itself is most admirably arranged. The ore is dumped upon a platform even with the top of the feed-trough, and after passing through the battery and over copper plates, it drops into a Hendy's concentrator, which discharges its debris through a trough in a Baux & Guind's pan, from whence it again passes to a *lavadero*, a large settling tub, described in our last issue, under the head of "A Virginia Gold Mine." The arrangement of all this machinery is such that there is no handling of the rock or pulp after it is placed under the stamps. It passes from one process to the other by the aid of water and its own specific gravity, each machine being set at a proper grade below that which precedes it. The copper plates are arranged upon an apron, the inclination of which can be regulated by a set screw to any angle required by the nature of the pulp which is passing over it.

The machinery for this mill was designed and built at the Union Foundry, in this city, and the mill was put up under the immediate direction of Mr. E. L. Robinson, a brother of one of the proprietors. The lode connected therewith is accounted a very rich one. It is narrow, and impinges, at nearly right-angles, against the well known "Big Blue Ledge," in Hunter's Valley. We expect to hear favorable accounts of the working of this mill.

WORKING STEAM EXPANSIVELY.—We would call especial attention to the concluding portion of the article from the *Engineer*, which will be found under our mechanical head to-day—with an indicator diagram. This is one of the best articles ever written upon this subject, and is well worth a careful perusal.

SURGICAL SELF-SACRIFICE.—Three physicians recently lost their lives in Heidelberg, by sucking the blood, in turn, during a surgical operation as the only means of saving the life of their patient, upon whose throat they had performed an operation to prevent suffocation. The blood was poisonous.

A VALUABLE MAP IN PROSPECT.—The Commissioner of the United States Land Office, Hon. J. S. Wilson, is preparing a map which will accompany his next annual report, on which will be represented a view of the world, with the relative commercial connection of the United States with every country on the globe. Such a publication will be not less novel than useful.

## Award of Gold Medals.

The Committee appointed by the managers of the late State Agricultural Society to award gold medals for the most meritorious articles exhibited at the late State Fair, met at the Society's rooms, in Sacramento, on Thursday of last week, to attend to their appointed duty. The Committee consisted of Gov. Leland Stanford, Attorney-General McCullough, B. B. Redding, Secretary of State, J. F. Houghton, State Surveyor-General, W. R. Gluyas, Superintending Engineer for the California Steam Navigation Company, Horace D. Dunn, State Commissioner of Emigration, and W. B. Ewer, of the *Mining and Scientific Press*. Four of the Committee are residents of Sacramento and three of this city. The meeting being organized, it was decided to award the medals in the order of the departments, as arranged by the managers of the Society. These departments were as follows:

First Department, Live Stock; Second Department, Machinery, Implements, etc.; Third Department, Mechanical and Domestic Products; Fourth Department, Agricultural Products; Fifth Department, Horticultural Products; Sixth Department, Fine Arts, etc.

We condense the following from the *Evening Bulletin*:

FIRST DEPARTMENT.—In this department there were four claimants, viz: J. D. Patterson, of Alameda, and Thomas Cotter, of Elk Grove, Sacramento County; Seneca Daniels, Sonoma County, and Joseph Gillis. The two first named claimed on account of fine woolled sheep, while the third on behalf of blooded stock, and the last for swine. The statements of each of the contestants were read, and the Committee decided unanimously to award the prize medal to sheep, on the ground that there was greater need and value to the State in the improvement of the wool crop, and that that branch of stock raising most required encouragement. The gold medal was awarded to John Patterson, on the grounds that his efforts were more decided toward improving the quality of wool, and his flocks comprising the largest number of pure-blooded animals owned by one person in California.

SECOND DEPARTMENT.—The contestants in this department were numerous, the articles exhibited being particularly valuable. There had been improperly classed together many valuable articles which could not be compared with each other competing for the medal. This condition of affairs rendered the labors of the committee very difficult, and occasioned much debate before a decision was had. After discussing the merits of the various contestants at considerable length, the committee finally divided upon the respective merits of the exhibit of Howland, Angell & King of this city, and Thomas Hanshrow's exhibit from Sacramento, compromised by awarding the regular gold medal of the department to Hanshrow and an extra gold medal to Howland, Angell & King.

THIRD DEPARTMENT.—In this department the difficulty of making awards increased, as all the material manufacturing interests and industries of the State were classed together. The statements made by these parties were in several instances most valuable for the history and statistical data of the different branches of manufactures, and doubtless when made public will surprise readers with their extent and pecuniary value to the State. The committee, after considerable debate, finally awarded the gold medal to the Pacific Woollen Mills of this city, for knit woolen goods, on the grounds of most extensive scope of manufacture, newness of enterprise and need of encouragement on the part of the public as against importations. A portion of the committee were in favor of awarding or recommending an extra medal to Messrs. Newman & Brennan of the San Francisco Glass Works.

FOURTH DEPARTMENT.—In this department were the following contributors, viz: D. L. Perkins of Oakland for seeds, B. M. Bugbey of Folsom for foreign varieties of vines, I. Landsberger for wines made from native grapes, M. S. King for canned fruits and preserves, and L. Prevost for silk cocoons, etc. A portion of the committee favored giving the medal to I. Landsberger for native vines, but the majority awarded it to L. Prevost for silk culture.

FIFTH DEPARTMENT.—This department embraced horticultural products only. The

contestants were C. A. Reed for apples and pears, and B. N. Bughey for raisins, the latter being awarded the gold medal.

SIXTH DEPARTMENT.—This department was headed "fine arts," but included several branches of manufactures as well as essays in hop and silk culture. The majority of the committee decided to only consider paintings, photographs and sculpture, throwing the other articles out, on the grounds that they could not be properly embraced in the division. On voting, the award was made to Norton Bush for oil paintings, the essays, which were of ten fold practical value to the State, receiving only a small vote.

THE IMPROVED GERMAN BARREL PATENT CASE.—BRODIE ET AL. vs. THE OPHIR S. M. Co.—The result of this trial in the U. S. Circuit Court, was briefly reported in our last week's issue; with the statement, at the same time, that a motion for a new trial had been heard; the case for the defendants being argued by Mr. C. McAllister and that of the plaintiffs by the Hon. P. G. Buchan and Mr. Hastings. At the period of our last publication, the matter was then under advisement by the Court. We may mention that the motion for a new trial, according to the notice served, was based upon two points, viz: "The judgment being contrary to law," and "contrary to evidence." The first point, however, was withdrawn by the defendants; thus legally establishing the validity of the patent, which will have the effect of making all subsequent infringers of the patent liable to treble damages, at the discretion of the Court. The case came up for final adjudication on Monday last, when Judge Field gave a judgment modifying the former one, so far as damages are concerned, reducing the amount from \$2,500 to \$1,162.50. As no appeal can be made to the Supreme Court at Washington for a less sum than \$2,000, the case under notice is now finally concluded. The patentees, however, have succeeded in establishing the unequivocal validity of the patent, the chief point aimed at by the action, the question of damages being only a secondary consideration, and was consequently not entered upon so explicitly as will be the case in future cases. We mention this last fact, because other infringers who may in like manner be sued for infringing the rights of patentees, may possibly be widely misled by deeming the damages awarded in the present case as a settled question. The legality of the patent having been established, we understand it is the intention of the patentees to shortly depnte some person to ascertain the particulars respecting other parties who have infringed, or continue infringing their rights, and commence suit for their immediate recovery, unless previously compromised. From the advertisement of Brodie and Radcliff, which will be found in our advertising columns, it will be learned that all wishing to compromise for past infringements, and desirous of obtaining licenses for the future, will be equitably treated with, provided the patentees are not previously forced to commence stay of proceedings in order to obtain damages.

THE RYERSON PROCESS.—In describing the Ryerson mode of amalgamation, the *Atlas* of the 6th inst., omits the important fact, that several, say five or six gallons of cold water, are thrown in upon the pulverized ore before the *dry* steam is introduced; also that wet or ordinary steam is introduced before the dry. The reason for this introduction of water and wet steam is obviously to prevent the dry steam from blowing, as it would do, the finely pulverized ore and consequently mercury, through the escape pipe, on the safety valve. The safety valve is weighted with from sixteen to eighteen pounds, and is raised in less than three minutes after the introduction of the dry steam. If this valve is not used, the escape must be opened, or there would be danger of explosion. The above is in accordance with the practice of Ryerson, and those who worked under his instruction.

**New Books**

**SULPHURETS: What They Are, How Concentrated, How Assayed, and How Worked;** with a Chapter on the Blow-pipe Assay of Minerals; **Wm. BARSTOW, M. D.**

We have received a copy of this book from the publishers, A. Roman & Co. It is a neat volume of 114 pages duodecimo. We cannot give a better idea of its object than by quoting from the author's preface:

"There is no reason why the intelligent miner should not make his own assays, and determine for himself how to work his own ores. It is hoped that this work may serve the purpose of giving a 'start' to such. In it, clearness and conciseness of language have been aimed at. Technical terms have, as far as possible, been avoided. \* \* \* The wish has been to give practical details, rather than theory."

We welcome this as likely to be found a most useful book. We have seen no work which seemed to contain the same amount of information upon these subjects in the same space. The reader is shown at once into the manner of preparing ores for assay, and a method of procedure laid down which is adapted to the limited means usually at hand in interior towns. An assay balance is described, which any miner can make with his jack-knife, and which will answer his purpose almost as well as those elaborate ones which usually constitute the most expensive item in an assayer's outfit. Simple rules are given for the calculation of the amount of metal to the ton of ore, varying according to the quantity used as the assay sample. The blowpipe, that valuable but too much neglected little instrument, which, with a few simple re-agents, furnishes a pocket laboratory in itself, forms the subject of a single chapter, which, though necessarily brief in a work of this size, serves to suggest an infinite source of instructive amusement.

By the aid of this book, considerable progress may be made in the assay and working of ores; and those who may have an appetite for such studies awakened by it, and who may desire to pursue them further, will find other books for their perusal, named therein. The low price at which it is issued, \$1, places it within the reach of all.

We have added it to the list of scientific works kept for sale at this office, to be found in another column.

**THE INDUSTRIAL FAIR OF 1868.**—In answer to several inquirers, we would state that the only correct publication of the sub-committees appointed by the Executive Committee on the 25th ult., was made in the **MINING AND SCIENTIFIC PRESS**. The city dailies were all in error, having left out entirely the Chairman of the Committee on Classification, Mr. H. Rosekrans, and having substituted Mr. Harrison for Mr. Hanscom on the Committee on Machinery for the exhibition building. As it is very important that there should be a full and correct publication of these sub-committees, we republish them in our present issue:

**Finance.**—Messrs. Bohlen, Coffran and Plum.

**Building and Sites.**—Messrs. Nunan, Elliott, Harrison, O'Conner and Macdonald.

**Circulars and Address.**—Messrs. Harrison, Pritchard and Williams.

**Printing.**—Messrs. Dunn, Corcoran and Pease.

**Machinery for Building.**—Messrs. Spiers, Hanscom and Austin.

**Premiums.**—Messrs. Macdonald, Lewis, Tilden, Plum and Spiers.

**Classification.**—Messrs. Rosekrans, Elliott, Young, Mosheimer, Dunn, Pritchard and Pease.

**Rules and Regulations.**—Messrs. O'Conner, Lewis, Rosekrans, Corcoran and Coleman.

**Application from Legislature.**—Messrs. Williams, Young and Nunan.

The Executive Committee met again, last evening, to hear the reports of the sub-committees.

**PATENT OFFICE REPORTS.**—We are under special obligations to T. C. Theaker, U. S. Commissioner of Patents, for the early reception of the three volumes of the Patent Office Reports for 1865. The increasing dimensions of these annual reports fully attest the rapidly increasing business of the Department.

[Editorial Correspondence.]

**The Patent Department.**

WASHINGTON, D. C., Oct. 10th, 1867.

Commissioner Tbeaker has succeeded—after a long course of just and judicious efforts—in securing additional rooms in the Patent Office building for the transaction of the business of his department. Notwithstanding the building was intended especially for the Patent Office, it has been largely occupied by the Department of the Interior—for the Pension Bureau, Land Office, Agricultural Department, etc., to the great hindrance and detriment of the Patent Office business. The Pension Bureau has now been obliged to contract and vacate a number of rooms; and a new and commodious brick building is being erected by the Government, near the Smithsonian Institute, for the Agricultural Department, which Bureau also vacate the Patent Office building in the spring.

More room being secured in the Patent Office Department, additional examiners and clerks have been appointed and new divisions created in the various classes. To assist the Commissioner in his desire to clear the docket, by the 1st of November, of all applications which were on hand on the 1st of October, the examiners have generously volunteered an extra hour's service per day until the undertaking shall be accomplished.

The great accumulation of business in the department the past year, has caused much extra work and increased expense to the Government, and an extra number of cases on hand at a time necessarily increased the list of interferences.

The increase of applications for patents is truly remarkable. The number in 1866 was 16,000, while in 1867 it is expected to reach fully 25,000. Thus, every year the service in the office of examining each application for a patent is enlarged, while the difficulty and labor of attorneys, soliciting claims for inventors, is correspondingly enlarged, as is also the necessity for inventors to secure the services of competent agents. D.

**MORNING STAR LEDGE.**—This mine is located near Madden's Station, Colfax, Placer county. A shaft has been sunk upon it to the depth of 50 feet. Quite a number of specimens from this shaft have been placed upon our table, illustrative of the general character of the ledge. There is nothing in the appearance of the rock which would lead one to think it promised much value; yet from certificates of assays and working tests before, it would appear to give promise of becoming a very valuable mine. We have before us the report of seventeen different assays, made by Mr. M. A. Hunter, of Sacramento, which vary in their results all the way from \$3 to \$537 per ton. Mr. Varney, of this city, recently worked 20 pounds of rock from this mine, which yielded at the rate of \$51.22 per ton of 2,000 lbs. There appears to be a notable quantity of silver in the bullion from this mine. Mr. Hunter, in his Sacramento assays, returns an average of about \$10 in silver to \$100 in gold. Mr. J. J. Reed, the principal owner of the mine, informs us that he is about shipping 20 tons of the rock to the Golden Rule Mill to be worked; 20 tons more will be shipped to Grass Valley, and 10 to Mr. Hunter's works at Sacramento. We trust the most satisfactory results will be returned from each lot. The vein is a very heavy one, being about 30 feet in thickness. There are several other ledges in the immediate vicinity and running parallel with the Morning Star.

**INFORMATION WANTED.**—The whereabouts of Bernard Fanning, or his representatives, is anxiously desired by his nephew. Mr. Fanning was formerly engaged in mining, and lived at the time on Natoma street, in this city. Any person conveying information of his present whereabouts, to this office, will confer a great favor upon the party seeking the information.

**MARKET STREET HOMESTEAD ASSOCIATION.**—J. S. LUTY, Secretary. Office, 305 Montgomery street, corner of Pine, San Francisco. 2v15

**BUSINESS NOTICE.**—Mr. A. T. Dewey, of this journal, contemplates a visit of several months in the Atlantic States, a portion of which time he will spend in Washington, New York and Boston. Any of our Eastern friends who wish to communicate with him, for business or other purposes, will address their letters to "Westfield, Mass."

**JACOB SNOW, Pioneer Photographer,** 612 Clay street, north side, four doors above Montgomery, (late 315 Montgomery street,) takes all kinds of Photographs in the best style of the Art. He would invite especial attention to the new "Cabinet Photographs," which he is taking to perfection. 10v14tf

**SECRETARYSHIP FOR MINING COMPANIES.**—A gentleman of education, ability and experience, is desirous of procuring a position as Secretary, or Assistant Secretary, in some good Mining Company. Has most unexceptionable references. Address "SECRETARY," at this office. 6v15tf

**Save Your Teeth.**—Do not have them extracted without first consulting a good Dentist. The loss is irreparable, and, in many instances, unnecessary. DR. BEERS, corner of Pine and Kearny streets, makes a specialty of filling the fangs of dead Teeth, and building up broken crowns with **PLAZ GOLD**—thus restoring them to their original usefulness and beauty.

Call and examine the work. Finest quality of artificial work also manufactured. 16v14tf

**Perry Davis' Vegetable Pain Killer.**

This medicine has relieved more pain, and caused more relief than any other one thing that can be named. It is a "balm for every wound." Our first physicians use it and recommend its use; the apothecary finds it the first among the medicines called for, and the wholesale druggist considers it the leading article of his trade. All the dealers in medicine speak alike in its favor, and its reputation as a medicine of great merit and virtue is fully and permanently established, and it is the "Great Family Medicine of the Age."

Prices, 25 cents, 50 cents, and \$1 per bottle. Sold by all Druggists, Grocers and Medicine Dealers everywhere. 15v16-1m

**NORTH AMERICA**

**Life Insurance Company.**

Usual Restrictions on Occupation and Travel **ABOLISHED!**

Policies of this Company are guaranteed by the State of New York, which is true of no other Company on this Coast.

The most Responsible and Liberal Company in the World!

**ROOT'S**

**Patent Force Blast Blower.**

Adapted for Smelting, Foundry, Mining and Steamships.

Requires 50 per cent. less power than any Blower now in use. For further particulars, address **KEEP, BLAKE & CO.,** Stockton; or **Wm. T. Garrett,** corner Mission and Fremont streets, San Francisco. 5v15n19p

**Oakland College School.**

THE PATRONS of this Institution have the choice of several distinct Departments. THE SENIOR CLASSICAL is designed as preparatory to the College of California.

THE SENIOR ENGLISH affords a complete course of instruction in the English branches, in Theoretical and Practical Business, Science and Art.

THE JUNIOR is especially qualified to meet the wants of young boys, for whom separate apartments and Teachers are provided.

Throughout all the various departments, great attention is given to the study of the Modern Languages.

For further information, or Catalogues, address, **I. H. BRAYTON, Principal,** OAKLAND, California. 5v15n19p

**PACIFIC**

**Rolling Mill and Forge Co.,**

SAN FRANCISCO, CAL.

Established for the Manufacture of **RAILROAD AND OTHER IRON**

**Every Variety of Shafting**

Embracing ALL SIZES of Steamboat Shafts, Cranks, Piston and Connecting Rods, Car and Locomotive Axles and Frames.

—ALSO— **HAMMERED IRON**

Of every description and size.

Orders addressed to **PACIFIC ROLLING MILL and FORGE CO.,** Post Office, San Francisco, Cal., will receive prompt attention.

The highest price paid for Scrap Iron. 9v14n3p

**DR. FONDA'S San Francisco Eye Infirmary.**

Permanently established for the treatment of all diseases of the Eye. Dr. F. was for seventeen years principal of the Lafayette (Ind.) Eye Infirmary. F. W. FONDA, M. D., Surgeon in Charge. Office, 402 Montgomery street, opposite Weil, Fargo & Co's. 4v16j3p

Established in 1849--Corner First and Mission streets, San Francisco.

HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic, Fly, Race, screw and Drop Presses, Coining Machinery, Pile Drivers, Bark and Malt Mills, and all kinds of Castings.

**ENGINES.**—Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott & Eckart's Adjustable Cut-off Regulator—best in use; W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.

**BOILERS.**—Locomotive, Fluo, Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.

**PUMPS.**—The Excelsior double-acting Force Pumps are manufactured by us. These very superior Pumps are warranted the best, and are fast replacing all other Force Pumps.

**AMALGAMATING MACHINERY.**—Wheeler & Randall's Improved Tractory Curve Pan, Zenas Wheeler's Improved flat bottom pan, Beldin's pan, Veatch's tubs, Prater's concentrators, Waklee's pans, Beers' pan, German Barrels, Arasta Oaring, Chile Mills, Settlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams, Pans and Tubs. **BLAKE'S PATENT QUARTZ CRUSHERS**, of all sizes.

**OIL BORING TOOLS AND MACHINERY.**—Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania. We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.

Russia Iron Screens, of all degrees of fineness and of all qualities of Iron. All work done in the best manner at the lowest cash prices.

H. J. BOOTH. GEO. W. PRESCOTT. IRVING M. SCOTT.  
24-12 H. J. BOOTH & CO.

A Word to Readers in the Atlantic States.

Much complaint has reached us, through various sources, at the general lack of knowledge at the East, with regard to mining and other operations on this coast, and the frequent impositions practiced upon the public there, in consequence, by irresponsible persons passing off upon unsuspecting victims worthless mining stock, or persuading them, by false representations, to organize companies and advance moneys upon worthless ground, or ground which oftentimes has neither value or locality. If our friends at the East, who are still anxious to engage in the laudable venture of mining enterprise, would do so intelligently, let them subscribe for and carefully consult the only journal on the Pacific coast where every mining enterprise that is worth naming is, from time to time, noticed, as its merits may warrant. A mining enterprise on the Pacific coast, which is not referred to in this journal, in some way or other, as often as once in three or four months, is certainly one which people in the Atlantic States should beware of. Our advice to people at the East is never to venture small amounts in mining. If you must start small, let a number of such club together, so as to make the aggregate amount to be invested, such as may be worth your while to inquire into. Jan. 1, 1867.

**IMPORTANT COAL DISCOVERY, PROBABLY.**  
The *Territorial Enterprise*, of October 29th, has the following:

W. Troop and Henry Donnell arrived in this city last Saturday from Pine Grove, Wilson District, bringing with them specimens of coal, or something like it. The stuff burns, and may be coal, bituminous slate, or something of the kind. Coal oil has been distilled from the stuff, and it has a strong bituminous smell. It is from a deposit about 100 feet in width, situated on the side of a hill about two miles from Pine Grove. The strata of coal are from six inches to two feet wide, with layers of slate intervening. Nothing has been done as yet towards the development of the deposit. Experiments to test the value of the mineral will shortly be made, when, should it be deemed advisable, the mine will be properly opened.

The same paper of Nov. 2d, adds: Mr. Henry Donnell gives the following as the result of an experiment tried upon some of the coal brought in by him from Pine Grove. The coal was tested by an expert at Dall's Mill, Washoe county. Ten pounds of the coal placed in a retort yielded sufficient gas to supply one burner for twelve hours, while from a joint of the pipe leading to the burner there was saved of oil resembling crude petroleum, about a common wine-glass full. The discoverers of the vein are satisfied they have a good thing, and Mr. Donnell leaves on Monday to secure the land on which the vein is situated. Although the vein is said to be 100 feet thick there is no such unbroken thickness of coal. The coal is found in seams ranging in thickness from six inches to two feet, with intervening strata of shale. It is supposed that where the vein is followed into the hill a short distance, many of the coal seams now separated by slate will be found to unite. As yet no work has been done for the development of the mine—all the specimens brought here having been obtained from the surface.

**IMPORTANT DECISION.**—It seems that the officers of Alpine County had a bill passed by the last Legislature, authorizing the supervisors of that county to levy a tax of one dollar per cord for all wood floated down the Carson River from that county, and intended for consumption in the State of Nevada; also, the same for every 1,000 feet of lumber. Their right to levy such a license was denied, and a case was taken up to the Supreme Court, which has just decided that the license is virtually a tax on the exportation of wood from this State to another, and is a usurpation of the exclusive power of Congress to regulate commerce between the States.

**Piles! Piles! Piles!**

**NOT PILES OF GOLD, NOR YET OF SILVER,** so much coveted by all men; but the BLEEDING, BLIND or EXTERNAL PILES, can be easily and speedily cured by the use of

**WOOD'S SUB-POSITORY.**

It is a preparation totally distinct from anything heretofore offered as a remedy for this painful and often fatal complaint. The SUB-POSITORY is neither a pill, powder, wash or salve, and yet it has proved to be a certain remedy for the Piles. Do not doubt this assertion, or delay to reach the truth of it if you are troubled with the Piles—you will not be deceived in it.

ORISWOLD, corner of Mission and First streets; OLD FAMILY DRUG STORE, corner Mission and Second streets; UNITED STATES DRUG STORE, Bush st cor, between Montgomery and Kearny. C. WOOD, Proprietor, No. 63 Tehama street, between First and Second. 21v14-3

**THE PACIFIC IRON WORKS,**

First & Fremont Sts., between Mission & Howard, San Francisco.

The proprietors of the above Works invite the attention of all parties interested to their greatly improved and unequalled facilities for manufacturing Steam Engines and Boilers, both Marine and Stationary, of any required size and pattern, Quartz Mills, Amalgamating, Pumping and Hoisting Machinery of the most approved construction. Flour, Saw, and Sugar Mills, Water Wheels, &c., &c. Our pattern list is most complete and extensive, embracing the late improvements in all classes of machinery adapted to use on this coast. We would call especial attention to the fact that we have secured the exclusive right of manufacture for the Pacific Coast of the celebrated Greene Engine, conceded to be the most economical and perfect working Engine now in use. We are also exclusive manufacturers of the celebrated

Bryan Battery, Varney's Amalgamators and Separators, Eyerson's Superheated Steam Amalgamators and Rotary Crushers, Stone Breakers, &c. Orders respectfully Solicited.

**Important to Californians.**—Many inventors have lately had their claims for Patents seriously, and in some cases fatally, delayed by the unqualification of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations. These discrepancies, although arising from the inexperience of honest agents, are none the less dangerous to applicants for patents, whose safest course is to trust their business with none but active and experienced solicitors. THE MINING AND SCIENTIFIC PRESS PATENT AGENCY has strictly complied with the requisitions of the Department, and properly filed all necessary papers as Claim Agents.

FIRST

**Paint Manufactory** IN CALIFORNIA.

EPES & E. H. R. ELLERY

Have the Patent Right for the Pacific Coast to manufacture, sell and use

Ellery's Patent India Rubber Cement & Paint. It is for all exposed surfaces, impervious to wet, will not rot, peel, blister or crack in any climate. A superior Paint for brick, wood, cloth, metals, etc.; successfully used in the Eastern States. The old tin roof of that large building, the New York Rice Mills, was in such bad condition it was about to be taken off ten years since they put on the INDIA RUBBER CEMENT AND PAINT, making a good tight roof. A coat of India Rubber Paint every two years since keeps it in good condition. We can refer to many others. The Atlantic Lead Works use our Paint only.

NEW CLOTH ROOFS put on copings and all seams cemented and saturated, then coated with the India Rubber Cement and Paint, in the same as on the St. Nicholas Hotel at New York City, the City Buildings and many others, the roofs of all the horse and steam cars, decks of steamships, etc., around New York—for eight dollars per one hundred square feet. NEW OR OLD TIN ROOFS cemented and painted with the India Rubber Cement and Paint guaranteed, at from one cent to two and a half cents per square foot, according to size and condition of roof. Good men and the best materials used.

We have just cemented and painted old tin roofs of Dr. H. D. Cogswell, Tubbs & Co., D. J. Oliver, etc., and the wood work of Sheriff Davis's building, 88 feet front, on Polson street, between First and Fourth streets—only one coat. The work will speak for itself. Now painting the cornice and iron work of Dr. H. D. Cogswell's building, corner of Front and Clark streets—the coat. See the above and further references at our office.

ELLERY'S PATENT INDIA RUBBER CEMENT AND PAINT is composed of India rubber and other gums, dissolved in linseed oil, mixed with the various coloring matters, and ground in any color. When applied to roofs or other purposes, it is mixed with pure linseed oil to the required thickness, and put on as other paints are, with a paint brush—retaining sufficient elasticity to give and take with the heat and cold. Fifteen hundred fishing vessels at Cape Ann use the India Rubber Paint, finding it superior to all others.

EPES & E. H. R. ELLERY are now prepared to make good roofs, and cement and paint new or old ones, and do all kinds of outside painting with Ellery's Patent India Rubber Paint. No asphaltum on coal tar roofs. Office, No. 226 Jackson street, corner Battery, San Francisco, Cal. 6v15

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the first day of November, 1887, an assessment of fifteen cents (15c) per share was levied upon the capital stock of said Company, payable on and after November sixth, 1887, in United States gold and silver coin, to the Secretary, at his office, 609 Market street, San Francisco, Cal.

I. X. L. Gold and Silver Mining Company.

Location of Works: Silver Mountain District, Alpine County, Cal. Notice.—There are delinquent, upon the following described stock, on account of assessment levied on the twenty-third day of September, 1887, the several amounts set opposite the names of the respective shareholders as follows:

Table with columns: Names, No. Certificate, No. Shares, Amount. Lists names like John H Williams, Martin C Miller, etc.

And in accordance with law, and an order of the Board of Trustees, made on the twenty-third day of September, 1887, so many shares of each parcel of said stock as may be necessary will be sold at public auction, by Olney & Co., auctioneers, 418 Montgomery street, San Francisco, Cal., on Thursday, the twenty-first day of November, 1887, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

Mount Tenabo Silver Mining Company.

Location of Works: Cortez District, Lander County, State of Nevada. Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the eighth day of November, 1887, an assessment of one dollar and fifty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, No. 331 Montgomery street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the twelfth day of December, 1887, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the thirty-first day of December, 1887, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

Mount Tenabo Silver Mining Company.

District, Lander County, Nevada. Notice is hereby given, that the Annual Meeting of the Stockholders of the above named Company will be held on THURSDAY, the twenty-eighth day of November, 1887, at 11 o'clock A. M., at the office of the Company, No. 331 Montgomery street, San Francisco, for the election of Trustees to serve the ensuing year, and for the transaction of other business.

Whitman Gold and Silver Mining Company.

Location of Works: Indian Springs District, Lyon County, Nevada. Notice is hereby given, that the following named shares in the capital stock of the Whitman Gold and Silver Mining Company, designated by the number of Certificate of each parcel of said stock, were sold, as by law provided, at public auction, on the twentieth day of October, 1887, for delinquent assessments thereon, and will not be transferred by said Company:

Table with columns: No. Cert., No. shs., No. Cert., No. shs., No. Cert., No. shs. Lists certificate numbers and share counts.

Whitman Gold and Silver Mining Company.

Location of Works: Indian Springs District, Lyon County, Nevada. Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the thirty-first day of October, 1887, an assessment of one dollar and fifty cents per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, at his office, (room No. 10, 2d floor) No. 402 Montgomery street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the twenty-first day of November, 1887, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-third day of December, 1887, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

Whitman Gold and Silver Mining Company.

Location of Works: Indian Springs District, Lyon County, Nevada. Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the thirty-first day of October, 1887, an assessment of one dollar and fifty cents per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, at his office, (room No. 10, 2d floor) No. 402 Montgomery street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the twenty-first day of November, 1887, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-third day of December, 1887, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

Sophia Consolidated Gold and Silver Mining Company.

Location of Works: Tuolumne County, California. Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the seventh day of November, 1887, an assessment of fifty cents per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, at No. 641 Washington street, San Francisco, Cal.

Mining Notices—Continued.

Cordillera Gold and Silver Mining Company.

Location of Works: Chihuahua, Morelos Mining District, Mexico. Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-fourth day of October, 1887, an assessment of one dollar per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary.

Chilpanca Mining Company—District of Ures.

Location of Works: Sonora, Mexico. Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-first day of October, 1887, an assessment of five dollars (\$5) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, 318 California street, San Francisco.

Chalk Mountain Blue Gravel Company.

Location of Works: Nevada County, California. Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the eighth day of October, 1887, an assessment of one dollar and fifty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary.

Gold Hill Tunneling Gold and Silver Mining Company.

Location: Gold Hill Mining District, Conny of Storey, State of Nevada. Notice.—There are delinquent, upon the following described stock, on account of assessment (No. 9) levied on the nineteenth day of September, 1887, the several amounts set opposite the names of the respective shareholders, as follows:

Table with columns: Names, No. Certificate, No. Shares, Amount. Lists names like C L Gayard, R Pasquale, etc.

Kelsey Gold and Silver Mining Company.

Location of Works: El Dorado County, California. Notice.—There are delinquent, upon the following described stock, on account of assessment levied on the twelfth day of September, 1887, the several amounts set opposite the names of the respective shareholders as follows:

Table with columns: Names, No. Certificate, No. Shares, Amount. Lists names like Noble Lovely, Wm Seares, etc.

Whitman Gold and Silver Mining Company.

Location of Works: Indian Springs District, Lyon County, Nevada. Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the thirty-first day of October, 1887, an assessment of one dollar and fifty cents per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, at his office, (room No. 10, 2d floor) No. 402 Montgomery street, San Francisco.

Whitman Gold and Silver Mining Company.

Location of Works: Indian Springs District, Lyon County, Nevada. Whitman Gold and Silver Mining Company.

Location of Works: Indian Springs District, Lyon County, Nevada. Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the thirty-first day of October, 1887, an assessment of one dollar and fifty cents per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, at his office, (room No. 10, 2d floor) No. 402 Montgomery street, San Francisco.

Whitman Gold and Silver Mining Company.

Location of Works: Indian Springs District, Lyon County, Nevada. Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the thirty-first day of October, 1887, an assessment of one dollar and fifty cents per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, at his office, (room No. 10, 2d floor) No. 402 Montgomery street, San Francisco.

Whitman Gold and Silver Mining Company.

Location of Works: Indian Springs District, Lyon County, Nevada. Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the thirty-first day of October, 1887, an assessment of one dollar and fifty cents per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, at his office, (room No. 10, 2d floor) No. 402 Montgomery street, San Francisco.

Whitman Gold and Silver Mining Company.

Location of Works: Indian Springs District, Lyon County, Nevada. Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the thirty-first day of October, 1887, an assessment of one dollar and fifty cents per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, at his office, (room No. 10, 2d floor) No. 402 Montgomery street, San Francisco.

Whitman Gold and Silver Mining Company.

Location of Works: Indian Springs District, Lyon County, Nevada. Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the thirty-first day of October, 1887, an assessment of one dollar and fifty cents per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, at his office, (room No. 10, 2d floor) No. 402 Montgomery street, San Francisco.

Lady Bell Copper Mining Company.

Location of Works: Low Divide District, Del Norte County, California. Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-fourth day of October, 1887, an assessment of fifteen cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at No. 641 Washington street, San Francisco, Cal.

Nuestra Señora de Guadalupe Silver Mining Company.

Location of Works: Tayoltita, San Dimas District, Durango, Mexico. Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-first day of October, 1887, an assessment (No. 2) of one dollar (\$1) per share was levied upon the assessable capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, E. J. FRIEZE, at the office, No. 210 Post street, or to the Treasurer, A. H. WILKINS, at his office, No. 637 Washington street, San Francisco.

North Star Gold and Silver Mining Company.

Location of Works: Reese River Mining District, Lander County, Nevada. Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 19th day of September, 1887, an assessment of twenty dollars per share was levied upon the capital stock of said Company, payable immediately, to the Secretary, George H. Faulkner, No. 423 Front street, San Francisco.

Quail Hill Mining and Water Company.

Location of Works: Quail Hill, Galavaca County, Cal. Notice.—There are delinquent upon the following described stock, on account of assessment levied on the eighteenth day of September, 1887, the several amounts set opposite the names of the respective shareholders, as follows:

Table with columns: Names, No. Certificate, No. Shares, Amount. Lists names like G W Weaver, A E Hill, etc.

Whitman Gold and Silver Mining Company.

Location of Works: Indian Springs District, Lyon County, Nevada. Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the thirty-first day of October, 1887, an assessment of one dollar and fifty cents per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, at his office, (room No. 10, 2d floor) No. 402 Montgomery street, San Francisco.

Whitman Gold and Silver Mining Company.

Location of Works: Indian Springs District, Lyon County, Nevada. Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the thirty-first day of October, 1887, an assessment of one dollar and fifty cents per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, at his office, (room No. 10, 2d floor) No. 402 Montgomery street, San Francisco.

Whitman Gold and Silver Mining Company.

Location of Works: Indian Springs District, Lyon County, Nevada. Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the thirty-first day of October, 1887, an assessment of one dollar and fifty cents per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, at his office, (room No. 10, 2d floor) No. 402 Montgomery street, San Francisco.

Whitman Gold and Silver Mining Company.

Location of Works: Indian Springs District, Lyon County, Nevada. Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the thirty-first day of October, 1887, an assessment of one dollar and fifty cents per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, at his office, (room No. 10, 2d floor) No. 402 Montgomery street, San Francisco.

Whitman Gold and Silver Mining Company.

Location of Works: Indian Springs District, Lyon County, Nevada. Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the thirty-first day of October, 1887, an assessment of one dollar and fifty cents per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, at his office, (room No. 10, 2d floor) No. 402 Montgomery street, San Francisco.

Whitman Gold and Silver Mining Company.

Location of Works: Indian Springs District, Lyon County, Nevada. Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the thirty-first day of October, 1887, an assessment of one dollar and fifty cents per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, at his office, (room No. 10, 2d floor) No. 402 Montgomery street, San Francisco.

Whitman O. & S. M. Co. nov9

Machinery.

VARNEY'S PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits. They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setters made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the PACIFIC FOUNDRY, San Francisco.

Hunt's Double-Action Pump

Is cheap, durable, strong, and not liable to get out of order. Built and on hand at No. 23 Second street, and 108 Jessie street. 13v15tf

E. O. HUNT, Prop'r.

E. T. STEEN,

Commission Agent for the purchase and sale of

Engines, Boiler Castings,

AND ALL KINDS OF MACHINERY.

No. 537 Washington, and 532 Merchant st., San Francisco.

HAS FOR SALE

- One Engine, 6-Horse Power, \$140
- One Engine with Boiler, 7-Horse, 000
- One Engine, Link for Hoisting, 15-Horse, 800
- Two Engines, Boilers, Port., 16-Horse, 1,200
- One Engine, 40-Horse, 1,200
- One Iron Battery of 4 Stamps, 500

Also, a great variety of

Boilers and Machinery,

CASTINGS OF ALL KINDS,

AT LESS THAN MARKET RATES.

Parties wishing to purchase or sell Machinery, of any kind, can do so to advantage through this agency. 12v15qr

Steam Pumps,

FOR DRAINING MINES OR ELEVATING WATER TO ANY HEIGHT.

PICKERING'S GOVERNORS

For Steam Engines.

Giffard's Injectors,

For Feeding Boilers.

PATTINSON'S

HURDY-GURDY WATER-WHEEL.

The inventor of this Wheel having, after much delay, finally obtained the patent for the same, is prepared to sell rights therefor to such as may be desirous of putting them up, or continuing those already in use. This is well known among miners as the "hurdy-gurdy wheel," and is considered the most economical Water-Wheel now in use.

Notice is hereby given, that the subscriber is the inventor and holds the patent right for the construction and use of the same; and that no person has a right to manufacture or use them without his permit. 7v15qr

THOMAS PATTINSON.

Brodie's Patented Improvements

FOR THE TREATMENT OF Gold and Silver Ores.

BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER. The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages the advertisers are enabled to offer these machines to the public at the following low terms:

- No. 1.—Or 10 inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut.—Price, \$600
- No. 2.—Or 15 inch Crusher, capable of similarly putting through five to six tons per hour. 850
- No. 3.—Or 18 inch Crusher, with in a similar manner crush from seven to eight tons per hour. 1,200

EXPLANATION OF THE ABOVE ENGRAVING. The frame is made of cast iron, bound with heavy wrought iron bands, making it very strong, and at the same time light and portable. The crusher is bolted to a wood frame of sufficient light to clear the fly-wheel, and allow the crushed quartz to pass off. The dotted lines show the movable and stationary jaws. Letter A represents the eccentric shaft by which the power is applied direct to the movable jaw. B represents the movable jaw, and C the fixed jaw. D represents the link or radius bar. E represents the bolts for regulating the opening, F, which can be regulated at pleasure, so as to graduate to the size to which it is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designated.

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, D, gives the movable jaw, S, a forward and downward motion at the same time, and which makes the hardest rock yield and separate into fragments of any desired size.

The above Crushers have been recently erected and are now successfully employed at Bear Valley, Marinosa county, Rawhide Ranch, Tuolumne county, and at Lake Mine, Lake District, Nevada county, and can be seen in operation at the Fulton Foundry, First street, San Francisco.

The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Rawhide Ranch" Mine, in Tuolumne county:

RAWHIDE RANCH, Tuolumne Co., Sept. 28, 1865. JAMES BRODIE, Esq., San Francisco.—My Dear Sir: It gives me pleasure to inform you that I have for the past three months had one of your largest sized Rock Crushers in use, at the Rawhide Ranch Mining Company's Mill, which has entirely met my expectations, and I have hesitation in recommending it to all who are in need of a machine for rapidly, cheaply and properly preparing quartz for the stamps. Yours truly, E. P. JOHNSON, Supt. Rawhide Ranch Quartz Mill.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.

For the present it is not intended to grant licenses for the use of the improved German Barrel, for a longer term than twelve months. All persons desirous of compromise, without having recourse to legal proceedings, for past infringements, or desirous of receiving Letters of License for the limited period named, are requested to address as below. A diagram, with explanations of this machine will be found in the Mining and Scientific Press, of September 29th, 1865.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—This Dry Crusher has been found the most economical and effective mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press, of Sept. 22, 1865. JAMES BRODIE, Fulton Foundry, or CHARLES RADOLPH, Express Building, 402 Montgomery street, San Francisco. 12v13tf

LEFFEL'S American Double Turbine

THESE WHEELS, UNEQUALLED AND UNRIVALED IN the United States or the world, have been fully tested on this coast, more than forty being in use at this date in California and Oregon, driving all kinds of machinery, Saw Mills, Flour Mills, Quartz Mills, etc., etc.

CALIFORNIA REFERNCES.—E. Steaton, Polson, O. Simmons, Oakland, (Mill at Clear Lake); Morgan Coville, Lexington, Santa Clara County; J. Y. McMillan, Lexington, Santa Clara County. Send for Circular, to KNAPP & GRANT, Agents for California, 310 Washington street, San Francisco. 25v13-lyq

Quartz Mill Construction and Superintendence

THE UNDERSIGNED IS AT PRESENT OPEN FOR AN engagement as a working Superintendent for the construction or operation of a quartz Mill. Has had five years steady and successful experience in working ores in Washoe, and is practiced in saving sulphurets and the treatment of rebellious ores. Is prepared to furnish references for all the necessary qualifications of an intelligent, faithful and reliable quartz operator. Address F. M. SHAW, San Francisco, care Mining and Scientific Press. 25v14cm

PICKERING'S ENGINE REGULATOR,

Warranted the Best in Existence.

Cheap and easy to attach to any Engine, old or new. Send for a Circular, to DAVID STODDART, 114 Beale street, San Francisco. 12v15-2am1q

E. O. HUNT,

Manufacturer of

Windmills, Horse-Powers, Pumps, Pumping Frames and Gearing.

HUNT'S ADJUSTABLE WIND MILLS to have all the sails so arranged as to turn edgewise to the wind when the mill is stopped. The sails can be set at any angle to suit the force of the wind, while the mill is running, by means of the brake lever at the foot of the mill, by any person.

HUNT'S SELF-REGULATING MILL is strong, durable and cheap. It is provided with means for stopping, in the most violent winds. This mill is well known throughout the State.

Tread Horse-Powers, Swap Horse-Powers, Pumps in great variety, Single and Double-Acting, Frames and Gearing for running pumps, from steam or other power, constantly on hand and built to order. Water Tanks built to order. No. 25 Second St., and Nos. 110 and 112 Jessie St., San Francisco. 2v15qr

SUPERIOR CUT-OFF ENGINES.

We desire to call the attention of Engineers, Manufacturers, and Millmen, to the celebrated

Hartford Engine,

With Wright's Patent Variable Cut-Off, which we are now manufacturing under a license from the Woodruff & Beach Iron Work Co., Hartford, Ct. To parties wishing a First-class

Fuel-Saving Engine,

Simple and durable in construction, this Engine is offered in the belief that it is superior to any other manufactured. It enjoys the very highest reputation in the Atlantic States, where it is well known; over 300 of them having been built by the Woodruff & Beach Company, and being now in successful operation.

GODDARD & CO.,

Pacific Iron Works, 9v15tt

DR. BEERS' PATENT WIRE GAUZE AMALGAMATOR.

THE ATTENTION OF QUARTZ, HYDRAULIC AND Placer Miners, is called to this new invention for saving Fine Gold. It is designed to furnish the miner with a cheap and simple apparatus by which the finest freeness can be saved without loss, requiring little attention, no machinery to drive it, and will positively collect every particle of amalgam, or of waste mercury that may have escaped from mill or sluice, and as these particles are always charged with more or less gold, this item alone, in many instances, will more than pay the cost of this Amalgamator every month. For Circulars, and further particulars, address Dr. J. B. BEERS, San Francisco, Per Wells, Fargo & Co's Express. 11v15 6m

A Mechanical Course for Our Public Schools.

We are pleased to observe that a movement has been made in the Board of Education for this city for the establishment of a Mechanical Course in our public schools. This is a movement in the right direction, which, if properly carried out, cannot fail to be productive of the most beneficial results. We have understood that the real mover in this matter was Mr. R. Bragg, of the 10th Ward, who personally urged the matter upon the attention of Mr. Scott, Director for the 9th District, who introduced it to the Board. In support of the measure, Mr. B. has sent a very carefully prepared communication to the Times, which we fully endorse and reproduce, slightly condensed, as follows:

The Eastern cities are alive to the importance of educating the working class. There have been legacies bequeathed from time to time for this purpose by men who knew the need of some system for their education. In Boston, for instance, there is a Mechanics' Apprentice Association, for the elevation and education of the apprentices. There is the Lowell Institute, where we have listened to many lectures, free to all. There is also an association of the leading mechanics, called the Mechanics' Charitable Association. The course adopted by the members of this association in their shops for apprentices is a model course. For machine shops, for instance, it is this: The first year the apprentice serves in the blacksmith's department, by which he is enabled to manufacture his own tools. The second and third year is passed in the machine shops, where he receives instruction. He is not worked to the utmost of his physical capacity; he is taught to take time and do his work well, and during the winter he is sent to a mechanical evening school, where mechanical drawing is made a specialty. In the last year of his apprenticeship he is taken into the counting-room and taught the business. We have seen graduates of the high schools, sons of the wealthy and influential, laboring at the forge and vice in the shops of members of this association.

By educating the mechanic, we elevate him socially. We add that dignity to labor which we often hear spoken of, but seldom seen in practice. We enable him to fill almost any position in the business world. We do not wish in any manner to discourage a commercial course; in fact, we believe we should have one. But how many young men there are, loafers on the corners of streets, waiters in saloons and bar-rooms, and occupying all sorts of menial positions, who have been highly educated to fill a commercial position, or more particularly educated to gain a livelihood without physical labor, because work was undignified. Had these young men received a mechanical education, how much better it would have been for society and themselves. From almost the earliest history of the world, we have accounts of sending from one country to another for mechanics, owing to the neglect on the part of certain nations to educate their mechanics. This we are doing, and it is wrong. It is an urgent necessity that we have a mechanical course, that we may make our own mechanics. The capital that is expended on flying machines, perpetual motion, and other machines and contrivances, whose principles are contrary to the mechanical laws, on this coast alone, would educate mechanics to that extent that they would be able to give an approximate estimate and an elaborate opinion on any machine or undertaking which might be brought before them.

Who are the prosperous mechanics? They are the self-educated, who from the time of their apprenticeship have devoted their leisure to self-culture. Let any professional man who has had the benefit of a collegiate course, visit the workshops of one of them, and I will venture to say that not one in ten could tell, whilst reviewing their sectional drawings, whether they were for a ship, a steam engine, a mill, or a suspension bridge; and could they, while reviewing these drafts, deny the importance of a mechanical course? Every one will become aware of the importance of a mechanical course, if they will examine any one of the mechanical works that are published, for it is almost impossible for a work of this kind to be placed in print that may be comprehended by any one of the graduates of our grammar schools, under their present system.

The future of this city is not known. Paris, London and New York will sink into insignificance, for this is the great mart of the Pacific. The whole Pacific Coast naturally looks to us for mechanical, commercial

and scientific men. On the educational system of this city depends the future of this coast. If, in our search for riches, we neglect to educate the young, who are to fill positions in every branch of industry, we retard the progress of civilization.

Let us take a financial view of the case. A mechanic without an education—a machine—receives \$2.50 per day, while one mechanically educated receives \$5.50 per day. The difference in favor of the educated is \$3 per day. Calling three hundred days, working days in a year, \$900. This is equivalent to \$10,000 capital invested on good security, for there are no taxes. In fact, there is no capital like a good trade, and no person can have a good trade without the education, for capital will vanish as a shadow, while the trade is ever your friend.

MINING IN UTAH TERRITORY.—From the Salt Lake Vedette, Oct. 26th: Paul Engelbrecht, arrived last evening from the Salmon mines, and reports favorably of that semi-arctic mining region. He says that new and good claims are constantly being found, and that by next season they will have a lively camp there. There are a large number of claims that will pay from \$8 to \$20 per hand as soon as water is brought on to work them. From 500 to 600 miners will winter there.

We noticed quite a large loaded pack train pass our office this morning bound for the Sweetwater mines.

John R. Murphy informs the Salt Lake Vedette, Oct. 10th, that everything is lovely at these mines; all highly pleased with their prospects; that he had crushed in his astras and amalgamated seven tons of average "carcosa rock," which yielded \$2,158, being an average of a little over \$300 per ton; and he assured us that, on account of the imperfect facilities for working the rock, he did not save over two-thirds of the gold it contained.

"Four Eights."—An English paper, anxious to get an insight into the opinions of working men, passed the greater part of an evening, not long since, at a public house resorted to by artisans on a strike. While there he was greatly puzzled by a toast which was given unctuously and received rapturously. It was the "Four Eights." He did not like to display his ignorance by asking what it meant, so he waited, and by-and-by his patience was rewarded. The whole company burst into a song, and the refrain of the ballad they sang was this:—

"Eight hours' work and eight hours' play,  
Eight hours' sleep and eight shillings a day."

These were the "Four Eights," and the "Four Eights," it was subsequently found, was the workmen's millennium.

NAPOLEON has paid a delicate compliment to the United States in naming the iron-clad ram Dunderberg, the "Rochambeau." It was Count Rochambeau who commanded the French auxiliaries that aided the Americans in capturing the British at Yorktown.

SANTA CLARA COLLEGE, S. J. SANTA CLARA, CAL.

Conducted by the Fathers of the Society of Jesus.

The SEVENTEENTH ANNUAL SESSION of this College will commence on August 28, 1867.

TERMS—Tuition in the Classical and Scientific Department, Boarding and Lodging, Washing and Mending of Articles Washed, School Stationery, Medical Attendance and Medicines, Fuel, Light, Baths, etc., per session of ten months, \$350.

For further information and catalogues, apply to the President of the College, or to Rev. A. Maraschi, St. Ignace College, Market street, San Francisco.

5v15-1m REV. A. MASNATA, S. J., President

THE CENTRAL PARK OF THE PACIFIC. Woodward's Gardens, ART GALLERY, MUSEUM, GYMNASIUM, AND ZOOLOGICAL GARDENS.

AN ORAND INSTRUMENTAL CONCERT every Saturday afternoon, and on Sundays a GRAND CONCERT OF SACRED MUSIC, appropriate to the occasion.

THESE BEAUTIFUL GARDENS ARE VISITED DAILY by hundreds of the pleasure-seeking public, and all agree in pronouncing them the best and only first-class suburban resort on the Pacific Coast.

The extensive grounds are covered with the rarest trees and shrubbery, making it a most desirable spot for small parties wishing to enjoy a Pic-Nic.

To all departments new attractions are being constantly added. These Gardens are accessible by the Howard and Market street Cars.

Entrances on Mission and Valencela streets, between Thirtieth and Fourteenth. OPEN EVERY DAY. Admission to all parts, 25 Cents. Children, under 12 years, half price. 10v16or

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

California Academy of Natural Sciences.

REGULAR MEETING.

MONDAY EVENING, Nov. 4, 1867.

President Whitney in the chair. Thirty members present.

George C. Johnson was elected a resident member.

Donations to Cabinet.—Mr. Bolander presented four packages of plants from France and Australia.

Mr. Stearns exhibited some fossil shells collected by Mr. Schmidt near Orleans Bar, Klamath county. Mr. Schmidt explained the method in which the Indians use an Indian relic, exhibited by himself. Mr. Whitney called attention to two mineral specimens obtained in Humboldt. These specimens consisted of oxide of antimony and antimoniates of lead.

Professor Whitney gave some statistics with regard to the occurrence of mineral species, and of the elementary substances contained in them, on the Pacific coast. He stated that the number of minerals occurring in California, and on the Pacific coast in general, taking the country from Northern Mexico to British Columbia, was quite small in proportion to the area of the region. Especially among the silicates is there a great deficiency in species, and very few of those which do occur are found sufficiently well crystallized form to be valuable as cabinet specimens.

The total number of species (following the fourth edition of Dana's Mineralogy for names, etc.) believed to exist on the Pacific coast, including Northern Mexico, Arizona, California, Nevada and Oregon, is 110, of which, however, 13 are somewhat doubtful. Of the 110, there are 89 which occur in California. Some of the mineral species most common in other parts of the world, and especially in mining regions, are either entirely unknown here, or else exceedingly rare. Thus, barytes, which is so abundant a veinstone in England and Germany, is almost unknown in the Sierra Nevada, having been only found in one or two localities, and there in minute quantity. Fluor is entirely wanting in the Sierra Nevada, although found in some quantity in Arizona and Nevada. Not a trace of this elsewhere so common mineral has been found, so far as known, in California.

Among the silicates most universally diffused, but which are, up to this time, entirely unknown in California, the following may be mentioned as some of the most predominant: Beryl, topaz, zircon, Wollastonite, scapolite, spodumene, Allanite, iolite, staurolite, kyanite, spinel, nepheline, datholite, and all the zeolites in other countries so abundant where volcanic rocks occur. Not a well defined specimen of a zeolite has yet been found within the borders of California.

Another curious fact in the mineralogy of California is the occurrence of some mineral species which are common as ores in other mining countries; but which, in California, or at least in the mining region of the Sierra Nevada, are disseminated through a great number of localities, but nowhere existing in workable quantity. Galena and blende may be particularly referred to as occurring in this way. There is hardly a gold-bearing vein in the Sierra which has not some galena and blende in fine particles in the veinstone; but not a locality is known where the quantity of either of these ores is anything like sufficient to justify mining, even were the other conditions as favorable as in the Eastern States or in Europe. Galena occurs in considerable quantity in the extreme southeastern portion of the State, or, just over the borders, in Arizona and Nevada; but no considerable deposit of zinc-blende has yet been made known anywhere in the Pacific States or Territories; nor is any other ore of zinc known to occur in workable quantity in any one of the Pacific States or Territories.

The mineral region with which ours most nearly agrees, in the character of its ores and mineral substances, is that of the South American Andes, especially of Chili. In Mr. David Forbes' recent catalogue of the Chilian minerals, there are about two hundred species enumerated, of which about sixty have hitherto been discovered in California and the other Pacific States and Territories. The Chilian mineral list, like that of California, is remarkable for the absence of many of the almost universally distributed silicates mentioned above as wanting in the Pacific States, namely: beryl, topaz, zircon, Wollastonite, Allanite, iolite, staurolite, kyanite, spodumene, spinel and datholite. Many other silicates, abundantly distributed throughout other portions of the world, might be mentioned as entirely wanting along the whole Pacific Coast. Several of the more common zeolites are found in the

Chilian list, which are wanting in California; while several others are equally wanting to both countries. Among the common zeolites found in Chili which have not yet been discovered in California are Prehnite, stilbite, Laumontite and solescite; while analcime, harmotome, Thomsonite, natrolite, henlandite, are wanting there as well as here.

It is evident from a comparison of the mineral lists of the States situated along the Pacific Coast of North and South America, that there has been a most remarkable resemblance in the conditions which have influenced the formation and segregation of the accidental minerals now found accompanying the stratified and eruptive masses, throughout the whole vast extent of the regions in question. This is another of the facts which go to show the unity of the Cordilleras of North and South America as a geological result.

Mr. Bolander stated that the absence of many mineral species from this coast found its parallel in a similar absence of many botanical groups. Dr. Cooper did not think there was any poverty with respect to animal species on this coast, and suggested that the absence of certain groups of plants might be due to the absence of certain appropriate mineral constituents from the soil. Dr. Behr thought that the California lepidoptera more nearly conformed to European and Mexican types than to those of the Eastern States.

NEW INCORPORATIONS.—Articles of incorporation have recently been filed in the County Clerk's office in this city as follows:

SAN FRANCISCO ART ASSOCIATION.—San Francisco. Nov. 4th. Capital stock, \$100,000; 10,000 shares, \$10 each. Trustees: G. A. Fuller, J. R. Lambert, R. J. Leader, H. S. Sparks and S. A. Edgwin.

REDDINGTON QUICKSILVER MINING CO.—Lake county, Cal. Nov. 5th. Capital stock, \$1,260,000; 1,260 shares, \$1,000 each. Trustees: John H. Reddington, George N. Cornwall and Horatio P. Livermore.

UNITED MECHANICS OF SAN FRANCISCO.—San Francisco. Nov. 6th. Capital stock, \$500,000; 1,000 shares, \$500 each. Trustees: Albert M. Winn, J. D. Cornell and Charles C. Terrell.

ELECTION OF OFFICERS.—At an annual meeting of the Golden Homestead Association, held on the evening of Nov. 4th, the following officers were elected. A. Holmes, President; Wm. Monahan, Secretary; Directors, T. Reynolds, John T. Barry, D. P. Fenton, H. Besby, Thomas B. Gately.

CALEDONIA G. & S. M. CO.—Oct. 28th. Trustees: Dr. Wake Bryarly, Edward Kennedy, Donald McDonald, W. S. O'Brien and W. B. Agard.

THE BEST IN AMERICA.

The Mining and Scientific Press,

is the Largest and Best MINING AND MECHANICAL Newspaper issued in the United States.

DEWEY & CO.,

Patent Agents, Publishers, Book and Job Printers, 505 Clay Street, San Francisco.

THE MINING AND SCIENTIFIC PRESS is published every Saturday. Each issue comprises sixteen pages (64 columns), and furnishes more valuable reading matter than any other weekly journal in California.

To the practical mechanic, metallurgist, prospector, millman, mine holder or worker, it is worth many times its subscription price. It fills contain a record of the improvements in mining machinery, the progress and development of the mines, and all new methods and processes for working and

SAVING PRECIOUS METALS,

All progressive information, in fact, transpiring with the times—which cannot be obtained from books.

The MINING AND SCIENTIFIC PRESS is now in its FIFTEENTH VOLUME, and enjoys a large circulation. It received the following hearty endorsement of the California Miners' State Convention, held at Sacramento, January 17th, 1866: Resolved, That we regard a mining paper or journal of great importance to the mining interests of California, and recommend the MINING AND SCIENTIFIC PRESS, of San Francisco, to the consideration and support of the miners of the Pacific coast.

Terms of Subscription.—One year, \$5; six months, \$3—in advance. Send for sample copies. Remittances may be made by mail at our risk. If parties sending will register their letters, or send money order.

AS AN ADVERTISING MEDIUM throughout the whole Pacific States and Territories, the Press is unsurpassed. Rates moderate.

SPECIMEN NUMBERS OF THE PRESS and Patent Circulars, sent free.

KOHLER, CHASE & CO., Agents, 267 1/2 Market Street, San Francisco.

Order Bussey's Combination Burglar and Powder-Proof Keyless Lock!

REASONS WHY.

- 1st. It is the best Combination Lock known.
- 2d. It is impossible to pick it.
- 3d. It can be subjected to over half a million changes, and when run by a burglar, he is no nearer entrance than when he began.
- 4th. It has no key to lose.
- 5th. The more it is used the better it is liked.
- 6th. It has no signs, letters or figures, on its face.
- 7th. It is the simplest to understand.
- 8th. It is impossible to open it without knowing the set.
- 9th. It is least possible to get out of repair, as any one will be convinced on examination.
- 10th. It is the strongest Lock.
- 11th. No possible derangement of combination can be made.
- 12th. Amador County has adopted this Lock for its safes.
13. It received a special premium at State Fair

Opinions of the Press and others in regard to Bussey's Combination Lock.

The Bank of British Columbia ordered the first one of these locks introduced in this city, and the following recommendation has been received by the inventor:

BANK OF BRITISH COLUMBIA, San Francisco, May 24, 1866.

Recently, two of Wm. C. Bussey's new Patent Combination Burglar-Proof Locks were placed upon the vault doors of the Bank of British Columbia. They are found to operate with all the efficiency claimed by the inventor and in every way meet our highest approval.

They were ordered upon mature deliberation, after strict investigation of their merits, in comparison with some of the most noted and popular old styles of combination locks.

We deem the lock entirely burglar-proof. It is strong in construction, without intricate or delicate parts, with simple and easy movement. We find no difficulty in either opening or closing it, nor in changing its combinations, which may be made almost innumerable. As a California invention of extraordinary merit, we take pleasure in recommending it to public attention, believing it to possess all the advantages which are claimed for it. WM. H. TILLINGHAST, Sub-Manager.

We do hereby certify, that Wm. C. Bussey's Combination Lock is the best Safe Lock in existence, and impossible to be picked. We have applied several to Vaults and Safes, to entire satisfaction to parties interested. KITTREDGE & LEAVITT, Pioneer Iron Works, cor. Fremont and Market sts.

SAN FRANCISCO, May 6, 1867.

I do hereby certify, that Mr. Wm. C. Bussey's Combination Lock is the simplest and strongest in construction, and the least possible to get out of repair; and for Safes and Vaults in every other respect as good as any other improved combination lock which I am acquainted with. JOHN R. SMILES, Vault Manufacturer, Oregon Street.

JACKSON, April 27, 1867.

I, the undersigned, Sheriff of Amador County, do hereby certify that I am using one of Wm. C. Bussey's Keyless Combination Locks on my safe, which is made to draw four bolts with facility. I believe the lock to be the best lock ever invented, for the following reasons: 1st.—Because it is impossible for either burglar or expert to pick it. 2d.—The lock being constructed without a key-hole, it cannot be blown to pieces by powder. 3d.—There is no possibility of deranging the combination by breaking off, or attempting to drive the knobs into the safe. And it is in fact the nearest approach to perfection yet arrived at in the art of Lock making. R. COSNER.

Attested by J. C. SHIPMAN, County Clerk.

JACKSON, April 27, 1867.

The undersigned, Treasurer of Amador County, do hereby certify, that I am now using one of Wm. C. Bussey's Keyless Combination Locks. It is fastened to the outside door of the Treasurer's Safe. I have no fear of any bystander gaining a knowledge of the set of the combination, when locking or unlocking the same. If I desire to have access to the safe every few minutes, I can so adjust the combination as to open this lock in two seconds of time. I am exceedingly well pleased with the same, and I deem this lock to be all that the inventor claims for it. OTTO WALTHER.

Attested by J. C. SHIPMAN, County Clerk.

CALIFORNIA LOCK AHEAD.—A special premium was awarded Mr. W. C. Bussey, for his superior Combination Powder and Burglar-Proof Safe Lock, at the recent State Fair. We are sure no award was ever more meritoriously bestowed. This Lock was described at length in the Press several months since. At that time it was adopted by several banking houses in this city, and we are now assured that the remarkable claims asserted in favor of the Lock at that time, have been confirmed since by its practical use. We feel an interest in this California invention, and wish to see it speedily meet with the success it is ultimately certain to attain. Mr. Bussey, having properly first fairly tested his lock in California, is now desirous of introducing it in the East, and offers to dispose of the right for several States at very reasonable rates.—[Mining and Scientific Press, Sept. 29, 1866.]

They are the only safe lock ever invented. Every State and County treasury vault, and every bank and business place should have one.—[Amador Ledger.]

This is a lock in which a series of rotating annular tumblers is employed, and it consists in a novel arrangement of such tumblers in connection with one or more arms connected with one or more bolts, whereby an extremely simple and effective lock is obtained, presenting an almost unlimited number of combinations. For which he was awarded a special premium at the State Fair.—[Sacramento Union.]

We, the undersigned, practical Locksmiths, unhesitatingly pronounce Bussey's Improved Combination Burglar Proof Lock to be the most reliable lock constructed. F. MARK & C. FLETCHER, No. 18 Post street.

Any good blacksmith can put this lock on safe doors. Boxed or single old locks removed and this placed in their stead, to work one, two, three or four bolts, as the case may be.—[See page 30 in Pacific Coast Directory.]

A deaf or blind man can open this lock when he knows the set and understands the full manipulation, without any expert detecting the combination. 19 1/2 Montgomery Street, San Francisco.

W. T. GARRATT, City BRASS AND BELL FOUNDER.

Cor. Mission and Fremont sts., SAN FRANCISCO. Manufacturer of Brass, Zinc, and Anti-Friction or Babbet Metal Castings: CHURCH AND STEAMBOAT BELLS,

PATTERN AND HAND BELLS AND GONGS, FIRE ENGINES, FORCE AND LIFT PUMPS, Steam, Liquor, Soda Oil, Water and Flange Cocks, and Valves of all descriptions, made and repaired. Hose and all other Joints, Spelter, Solder, and Copper Rivets, &c. Gange Cocks, Cylinder Cocks, Oil Globes, Steam Whistles,

HYDRAULIC PIPES AND NOZZELS For Mining purposes, Iron Steam Pipe furnished with Fitting, &c. Coupling Joints of all sizes. Particular attention paid to Distillery Work. Manufacturer of "Garratt's Patent Improved Journal Metal." Highest Market price paid for OLD BELLS, COPPER AND BRASS.

MINING COMPANIES

Can get their Printing done cheaper and better by TRUESELLE, DEWEY & CO. Than at any printing establishment in the city.

COUNTY OFFICERS

Can get their Blank Books and Blanks cheaper of TRUESELLE, DEWEY & CO., Than of any other printing house in the city.

MERCHANTS

When you want Printing done cheap, send to TRUESELLE, DEWEY & CO., Who do all kinds of Printing at the lowest rates.

FOUNDRIES

Will save money by having their printing done by TRUESELLE, DEWEY & CO., Who have put prices down to the lowest rates.

Foundry for Sale.

A One-half Interest in the UNION IRON WORKS, SACRAMENTO,

Owned by William R. Williams, is offered for sale on the most favorable terms.

A Good Bargain

May be had, as the proprietor is going home to Europe. It is seldom that so good an opportunity is offered for a sure and permanent investment. The business of the establishment is exceedingly flourishing, as can be shown. The Shop is of brick, new and well built. The lot is 35 feet front by 165 feet depth, in a good location for this business, on Front street, between N and O streets.

Inquire at the office of the Foundry, or address WILLIAM R. WILLIAMS, Sacramento, Cal.

28-13149-16P

IN THE PROBATE COURT OF THE CITY AND COUNTY of San Francisco, State of California.—In the matter of the Estate of HENRY GANAH, deceased. Order to show cause why Order of Sale of Real Estate should not be made. It appearing to the said Court, by the petition filed and presented and filed by Andrew D. Smith, the Administrator of the Estate of Henry Ganah, deceased, praying for an order of sale of real estate, that it is necessary to sell the whole of the real estate to pay the debts, expenses and charges of the administration of said estate. It is therefore ordered by the said Court, that all persons interested in the estate of said deceased, appear before the said Probate Court on MONDAY, the eighteenth day of November, A. D. 1867, at ten o'clock in the forenoon of said day, at the Court Room of said Probate Court, at the City Hall, in the City and County of San Francisco, to show cause why an order should not be granted to the said Administrator to sell so much of the real estate of the said deceased as shall be necessary. And that a copy of this order be published at least four successive weeks in the Mining and Scientific Press, a newspaper printed and published in said City and County. M. C. BLAKE, Probate Judge. Dated October 17th, A. D. 1867. 1615-5W

## The Hicks Steam Engine.

We place before our readers, to-day, an illustration of the Hicks Steam Engine, which attracted so much attention at the State Fair, and which was awarded a special gold medal by the California State Agricultural Society. The engine was exhibited by the side of one of the well known and well finished Corliss Engines, made by Messrs. Goss & Lamhard of Sacramento, with which it presented a most marked contrast, both in arrangement and appearance. The former was the *ne plus ultra* of a perfectly finished engine, with all the most nicely adjusted arrangements for working steam expansively. The latter was probably the plainest and simplest looking piece of machinery

valve-rods, eccentrics, rock shafts, packing-boxes, slides, levers, cross-heads, and external attachments of every kind which they necessitate. The action of the pistons is alike simple and uniform, each being a slide valve for the one beside it. This invention, therefore, forms the most radical and entire change in steam engines which has been made since the days of Watt.  
Four single-acting pistons, working in the four cylinders marked B, B, B, B, are all connected to cranks on one shaft by suitable connecting rods, each piston taking steam before the next succeeding one has finished its stroke, thereby insuring a uniform and continuous motion, and avoiding the dead points which render ordinary engines so variable in their motions, and difficult to start, if stopped or caught on the center. This is in fact a double cut-off engine, with-

## Mining and Mining Machinery.

We understand that owing to recent very favorable developments made by Mr. W. H. Bovee in his mine near Angel's, Calaveras Co., he has laid aside the machinery hitherto used, as insufficient for the present demands of the same, and ordered from this city new machinery of greater capacity, which is to consist of two Wheeler & Randall and six Knox pans. A 45-horse power engine has also been ordered, with boiler in proportion; the latter is 54 inches in diameter, and contains 50 three and a half inch tubes. It was made of C. H. No. 1 American iron, and tested at 150 lbs. hydrostatic pressure, by Mr. C. C. Bemis, U. S. Boiler Inspector of this city.  
We understand that the work was put up under the supervision of Mr. Bemis and Mr. R. G. Carlyle, and is represented as unsurpassed as to quality of material and style of workmanship by anything of the kind turned out upon the coast.  
The boiler was built at the new establishment of Messrs. Bauerhyte & McAfee, corner of Howard and Beale streets, and was ready in two weeks from the day the order was received, doing much credit both to the skill and dispatch of the new firm. The pans and engine were from the Golden State Iron Works, First street.  
Palmer, Knox & Co. have also just shipped a complete set of hoisting works to Jackson, Amador Co., to the firm of Messrs. Coney & Bigelow, who have now a 30-horse power engine in process of construction at the same foundry.

## Hooker's Improved Lift and Force Pump.

We give herewith an illustration of Hooker's Improved Excelsior Pump, a re-issue and patent for which was recently obtained through this office. The improvement consists in casting the valve chambers and cylinder all in one piece, by which means larger

water spaces are obtained, and the breaking of a large joint to get at the valves obviated. A, A, show the honnets covering the valves, which are always accessible and easily removed, so that the valves may be reached without disconnecting the air-chamber or pipes. Four holes are drilled in the flange of the air-chamber, so as to allow the discharge pipe to be turned to the right or left, as desired. The suction pipe is easily detached, without disturbing the position of the pump, and arranged for iron or lead pipe. The largely increased sales of this pump, already a great favorite with the public, warrants us in making this illustration of the "improvement," which the proprietors feel confident will place it at the head of all double-acting force pumps. We are informed that there are seventeen different styles and sizes of this pump for sale, suitable for all purposes, and for every kind of power.

A NEW COUNTY.—Parties residing in that part of Sacramento County lying south of the Cosumnes River, and others residing in the northern part of San Joaquin County, are taking steps to petition the next Legislature to be set off into a new county.

HICKS' STEAM ENGINE.

which was ever constructed as a steam motive power.  
To the stereotyped eye the Hicks engine may seem faulty in the principle of its construction; but, judging from the operation of the one at the Fair, also the report of the manufacturers, Messrs. Howland, Angell & King, as well as from its reported practical working in the Atlantic States, where several hundreds are at work, giving results entirely satisfactory, both as regards economy and durability, we think there is nothing to justify any particular objection; but rather that it possesses many excellent features well adapted to the requirements of this coast.  
For hoisting purposes, and general use in the mines, it appears to possess many advantages over any engine now in use, its chief feature being its matchless simplicity. Its inventor claims that while retaining the entire principle and action of the best approved reciprocating engines, and doing no violence to the convictions of our most intelligent engineers, that this principle and action cannot be superseded as long as the present mode of applying steam continues; the details are so far simplified that the pistons connected directly to the crank form the only moving parts, and these with the cylinders compose the whole engine. This is done by making the pistons of suitable form and arrangement to enable them to perform also the offices of valves and cut-offs, dispensing not only with these contrivances, but also with the whole array of

out the friction of a double set of valves, with their multifarious attachments.  
The pistons are provided with proper ports and passages, which act in combination with ports and passages in the cylinders, to admit and release the steam, thus combining a slide-valve with the piston in one and the same piece, each piston admitting and exhausting the steam for its neighbor cylinder, as well as cutting off its own supply of steam from the boiler at any desired point. By this means the expansive force of the steam is used, and the exhaust allowed to remain open during the entire return stroke.  
These ports and passages are arranged opposite to each other in such a manner that a perfect balance to the pressure of the steam is effected, and the ordinary wear and friction of cylinders, pistons and valves almost entirely obviated. It will also be observed that the motions of the valve and cut-off are equal in rapidity to the speed of the piston, and that the cut-off works in the closest possible proximity to the piston.  
The pistons are effectually packed by a simple and convenient method, and can be tightened at pleasure. It is valuable for its extreme lightness, and its great freedom from liability of repairs. It is only about one-fourth the size and weight of the ordinary stationary engines of equal power; it requires no engineer to set it up; it needs only about one-fourth the area and cost of foundation; it cannot get out of line, and requires much less care and attention than any other engine. This engine was invented by Mr. Wm. C. Hicks, and was patented February 21st, 1865. We hope at an early day to be able to give an illustration of its interior and working parts.

CONTINENTAL Life Insurance Company, 302 Montgomery street, corner of Pine.

A VALUABLE PRESENT.—We had the pleasure, a day or two since, of examining a most elegant, valuable and appropriate gift, which will go East on the next steamer, sent by Mr. David Hewes, of this city, as a holiday present to a friend "at home." The gift consists of an elegant and beautifully finished cabinet, well filled with a rare and choice selection of minerals, fossils and curiosities—among which we notice, in addition to rich specimens of gold and silver ore from the most celebrated mines of California and Nevada, several beautiful specimens of stream tin from the newly discovered tin mines of Idaho, malachite from Siberia, azurite (blue copper ore) from the famous Burra Burra mine in Australia, silver from the Battapillas mine in Mexico, garnets from our new possessions in Alaska, etc. This collection was put up, arranged and catalogued by Mr. Charles Beiderman, of Thayer's drug store, corner of Howard and Third streets, where we had the pleasure of examining it. Mr. B. draws largely upon his own private collection in making up this elegant and appropriate present from an old Californian to his friends "at home."  
AMERICAN WINES IN PARIS.—The French journal *L'Invention*, over the signature of Denos-Gardissol, Solicitor of Patents, in speaking of the California wines at the Exhibition, says: "We believe this manufacture is destined at no distant day to compete successfully with us in the markets of the New World."

## Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[By our Special Correspondent.]

## General View of the Paris Exposition of 1867.

By W. P. BLAKE, Commissioner from the State of California.

## THE METALS OF THE EXHIBITION CONTINUED. SILVER AND GOLD.

The silver ores from the region of Austin and Eastern Nevada, brought by Col. Buel, form the last addition to the mineral display of the United States. It is by far the most important contribution of silver ores in the Exhibition, and coupled with the large masses of rich ore from the Poorman lode, Idaho, and the beautiful mass of dark-colored silver ore from Blind Springs, California, it makes an array of which the silver miners of the Pacific coast may well be proud, although they have not shown specimens of half of the well-known lodes. The Comstock lode is not represented in Col. Buel's collection, but fortunately there are a few specimens in Dr. Pigné's collection, and in that sent by your correspondent, so that it has been possible to show the character of the ores to those most interested, and to make some comparisons. There have been many inquiries for specimens of the Comstock, and many Californians are surprised that it is not more extensively and appropriately represented. There is a great demand, also, for information and statistics, and the edition of the little book which Col. Buel published upon Eastern Nevada has been exhausted. This was prepared by Myron Angel for the committee, and is accompanied by a map showing the various mining districts around Austin, and north and south of it.

A snite of specimens of the ores sent to the Imperial School of Mines, was assayed and yielded in silver at the rate of from \$67 to \$5,000 per ton of silver and gold. The committee have awarded a silver medal for this collection, and it will doubtless receive an appropriate notice in the official report to the French Government.

## THE POORMAN ORE.

The New York company which now owns and works the Poorman lode, sent over, in good season, several very large and wonderfully rich masses of the ore. It has occupied the top of a great pile of ores from the United States, and for a long time was hardly noticed by even experts as an object of any great consequence. It was only necessary, however, to look closely to see the massive ruby silver and crusts of chloride. The jury awarded a gold medal to Mr. Walbridge for this display. I am informed that the specimens are all to be smelted at the end of the Exposition. They will make a good sized ingot of silver and thus give convincing testimony of the value of the ores.

## THE BLIND SPRING ORE.

The very fine specimen sent by Dr. Harkness and Dr. Frey, of Sacramento, has attracted some attention from the mineralogists by reason of its richness in silver, and because it contains some of the compound called Partzite, and supposed to be a new mineral. It is the general opinion, however, that the mineral is not sufficiently well characterized to be regarded as a distinct species. It is probably a mixture of other minerals, and has not a constant composition.

## KONGSBERG SILVER MINES, NORWAY.

As regards beauty of specimens, and mineralogical interest, there is nothing so fine as the exhibit made by the Norwegian Government of the products of the Kongsberg mines. A glass case is filled with the most extraordinary crystallizations of native silver and of the sulphuret. This silver is remarkably white and contains a little quicksilver naturally alloyed with it. This collection is a very complete one, as regards the associate minerals and rocks, and is accompanied by several colored sections of the veins and galleries of the mine.

## CHILI SILVER MINES.

There is a very important collection of the silver ores of Chili. Some specimens of ruby silver in crystals from Chañarillo,

are remarkably large and beautiful, and are coveted by mineralogists without any hope of satisfaction, for the exhibition is made by the Chilean Government. There is, also, to be found in this collection, some specimens of the rare compounds of silver, such as amalgam crystals, the chloro-hromide of silver, and a new mineral, (a double iodide of silver and of mercury,) called *tocornalite*, by M. Domeyko, professor in the School of Mines at Santiago, who sends a short memoir with the collection. According to this author, the silver veins of Chili, such as those of Trés Puntas, Chañarillo, Agua Amarga, are found in an argillaceous limestone formation, often fossiliferous, and belonging to the jurassic epoch. These mines are further from the coast than the rich copper deposits.

## SILVER LEAD ORES.

The largest mass of silver in the Exhibition is in the French department, and comes from one of the silver lead companies of Pontgnaud. It is just as it came from the cupel, and is nearly one yard in breadth, and is valued at \$27,000. It is accompanied by interesting samples of the ores of lead, rough and dressed, and the products of the smelting and cupellation. There are several other similar exhibits and some very interesting models of furnaces of improved construction.

## GOLD AND ITS ORES.

California, of course, is first to be named, but it is not necessary to analyze the exhibition, or to write you anything about the mines and processes. Superficial observers are generally greatly disappointed in the representation of our mines. This is true of the public generally, and of most, perhaps, of the Californians. Almost every one looks for solid chunks of gold—for nuggets and trays full of the shining dust, and perhaps for a few ingots. All this would have been quite attractive to the crowd of visitors, but it would have told only a single fact after all, and one which every one knows—that there is and has been plenty of gold in California. The more observing and inquiring, however, find enough to interest and surprise them in the hundreds of specimens of ore, differing in their appearance and characters. A distinguished French savant when he stood before the open case with some 200 specimens of quartz before him, all containing more or less gold, could hardly believe the fact. He wanted to see the particular kind of quartz that carried gold; he wanted to see some distinctive peculiarity in the color or luster of the quartz, that surely indicated the presence of gold. A few specimens sufficed to show him that it would not be safe to condemn any quartz without a trial.

It is to be admitted, however, that the collection is not as rich in gold as it should be to properly represent the richest and most valuable gold veins of the world, and the most extensive deep placers.

The collection of gold crystals belonging to your correspondent has been privately exhibited to the mineralogists, and those who could best appreciate them, and they have excited great admiration. There is nothing comparable with them in the museums and collections of Europe. It has received an important addition by a present from his Imperial Highness, the Prince Nicolas Maximilianovitch of Russia, of a fine dodecahedral crystal from the Siberian mines. The large crystalline mass of gold from the Spanish dry diggings, California, which was exhibited for a time at San Francisco, in the window of Hickox & Spear, and was photographed by Watkins, is now in Paris, the property of M. Fricot, formerly the owner of the Eureka mine at Grass Valley. Owing to the difficulty and expense of making this unique specimen perfectly safe in the Exposition, it was not entered there, but M. Fricot has taken pleasure in showing it freely at his house to those most interested.

## COLORADO GOLD ORES.

Mr. J. P. Whitney, of Boston, has made a large display of the auriferous ores of Colorado. They occupy a long wall case, opposite to the central case in which the California collection is displayed, and the contrast between the two collections is very striking. The Colorado ores are nearly all sulphurets of iron, and quartz does not appear. They make a brilliant, sparkling display, and some of the specimens contain considerable quantities of gold visible to the unassisted eye, but in general the value is only to be known by assays. Mr. Whitney has published a pamphlet, with a map, descriptive of the Territory, in three languages, and distributes copies liberally. I am told that furnaces are erecting at the mines on a large scale for the reduction of the ore to a matte rich in copper and gold. This matte is then shipped to Swansea, Wales, where the separation of the metals is eco-

mically effected. A gold medal was awarded for this display. Mr. Whitney left here with a party a few days ago, for a short visit to the territory, and is to be back here in December.

## AUSTRALIA.

The total gold product of Victoria is very effectively shown by a tall gilded pyramid, which represents the bulk of the gold which was taken out of the mines from 1851 to 1866. This pyramid is 10 feet square at the base, and is 62 feet 5½ inches high; its bulk is 2,081½ cubic feet. It represents the gross weight of 36,514,361 ounces, or 1,117 tons, 15 cwt. 2 qrs. 26 lbs., and value £146,057,444 sterling. The pyramid is made in sections placed one upon another. A framework is covered with hoards, and these are covered with stout canvas, the surface of which is studded with hits of plaster and pebbles to represent the graius and lumps of gold. The gilding gives a uniform gold surface and the effect is very good. We could have sent a similar pyramid from California at a very moderate cost. But Victoria is not content with sending the appearance merely, the *dust* is there also. There are several varieties of placer gold in trays, and a few ingots, but there is no peculiar interest attaching to them. There are, also, some collections illustrative of the varieties of quartz, and some of the specimens, much resemble some of our quartz from Amador and Mariposa counties.

A model of the celebrated "Welcome Nugget," in plaster and gilt, is almost as good to exhibit as the original which was worth about \$50,000. It weighed a little over 2,200 ounces.

## QUEENSLAND AND NOVA SCOTIA.

There are several nuggets of gold from Queensland, the heaviest weighing eighty-four ounces. The quartz veins of Nova Scotia are represented by numerous specimens, some of them quite rich in coarse gold. The quartz is remarkable for its peculiar resinous and glassy luster, and the gold is remarkably yellow and of superior fineness.

There are several other collections of less extent which there is not space to notice in detail. In a future communication or report, I may be able to add many more facts and statistics of general interest regarding the gold and silver productions of the various countries.

[Written for the Mining and Scientific Press.]

## Shall we be able to make Diamonds?

By E. PIQUE.

As hearing on the above question, I intend to lay before your readers an article on "Allotropy," by Berzelius, adding some of my own remarks. Allotropy, as everybody knows, signifies the capability of some of the elements of assuming different conditions. Sometimes the same body will appear so different from what it has been a few moments before, as to make us doubt whether it be the same thing, and we would have the right to call it something else, only that in most cases we are able to change the body from one state into the other, although we have not yet been able to change the different elementary bodies into each other.

There is much more difference between a piece of charcoal and a diamond, than between copper and silver, as regards physical and chemical properties, but still we have no guide which will lead us to the transmutation of copper into silver, although we have sufficient proof of the identity of charcoal and diamond, so that by studying the difference between the conditions of the latter we might possibly be able to transform one into the other. It is also to be remarked, that many of the elements retain their allotropic conditions even in their combinations with other bodies.

By examining the manner in which different bodies are changed from one condition into another, we might, by analogy, arrive at a process by which we might change charcoal into diamonds. Berzelius distinguishes three different allotropic conditions, and calls them *a*, *b*, *g*:

1st. CARBON appears in all three of these conditions.

*a* CARBON—(Charcoal, Woodcoal.)—Very combustible; specific heat=0.24. The hydrogen it contains is not the cause of this condition, since the hydrogen can be removed by gently heating the coal in chlorine gas or in the atmosphere, and still it will not be changed into *b* or *g*. This change

can be accomplished by continued white heat.

*Ca* can also be obtained by gently heating a mixture of anhydrous carbonate of potash or soda, and potassium. After this, dissolve the mixture in water and wash the remaining coal. This is even still more combustible than charcoal.

*b* CARBON—(Blacklead, Coke, Anthracite, etc.)—Difficult to ignite, metallic luster, opaque; specific gravity=2.5; specific heat=0.20. Good conductor of electricity.

*g* CARBON—(Diamond.)—Very difficult to ignite, transparent, colorless; specific gravity=3.5, specific heat=0.147. Insulator of electricity. The difference between the diamond and black lead consists, therefore, in the form of the crystals, the specific gravity, specific heat, and in the facility for uniting with oxygen.

REMARK.—Carbon combined with nitrogen is difficult to ignite. It might contain the carbon as *Cb* or *Cg*.

2d. SILICIUM is known in two conditions:—*a* SILICIUM—Prepared by reducing silica with potassium. Very easily ignited. It explodes with molten saltpeter. It unites with sulphur by gently heating the mixture. The sulphuret of silicium so produced is very soluble in water, and forms silica, soluble in water, and still more soluble in muriatic acid.

*b* SILICIUM—By subjecting *a* silicium to a strong heat, which, however, need not be so powerful as that required to change *a* carbon into *b* or *g* carbon. This *b* silicium does not ignite, even if exposed to white heat. Molten saltpeter does not act upon it, neither does hydrofluoric acid show any action (although the latter acts very powerfully on *a* silicium.) It does not unite with sulphur. The silicates found in nature contain silica, likewise, in different conditions. Some of them are perfectly soluble in muriatic acid; but if they are submitted to a strong heat, and afterwards treated with muriatic acid, the acid will only dissolve the base they contain without dissolving any of the silica. Sometimes even the bases will not be dissolved, but remain in the residue; so that the silica in changing its allotropic condition simultaneously changed that of the bases.

3d. SULPHUR—There are three different kinds of sulphur, which possess different forms of crystallization, different specific heat and specific gravity.

4th. PHOSPHORUS and SELENIUM, likewise.

5th. ARSENIC, shows two conditions. *a* ARSENIC—By sublimating gaseous arsenic in another heated gas in a vessel at a low heat. Dark gray crystals, oxidizes in the atmosphere, changes at 49° into black sub-oxide.

*b* ARSENIC—By sublimating arsenic in a vessel of which that part where the sublimate deposits is heated to near the point at which arsenic assumes the form of gas, it is nearly white, of metallic luster, and of greater specific gravity than *a* arsenic. It oxidizes slowly, even when heated above 100° Fahrenheit.

## 6th. CHROMIUM.

*a* CHROMIUM—By reducing chemically pure chloride of chromium through potassium. Gray powder; ignites between 200° and 300°, and changes to green oxide of chromium. It dissolves in muriatic acid with evolution of gas.

*b* CHROMIUM—By reducing it with coal at a very high temperature. Light gray, metallic. Neither by heating nor by boiling it with aqua regia can it be oxidized or dissolved. (Only by hydrofluoric acid, or by strongly heating it with saltpeter or potash in the atmosphere, can it be changed into *a* chromium.)

If the oxide of chromium crystallizes in the state of *b*, it cuts glass like the crystallized silica.

7th. TITANIUM is analogous to the chromium.

8th. TIN—(The two modifications of the peroxide of tin are known to every chemist.)

9th. IRIIDIUM and OSMIUM—We cannot obtain these artificially, either of such great specific gravity as found in nature, or with a like indisposition to combination. The native metals, even at white heat, do not combine with other molten metals, but reappear in the original shape quite unchanged if we dissolve the metal with which we have attempted to combine them.

But the osmium of the laboratory is easily changed by heat into volatile oxide, which is very difficult of reduction by means of hydrogen.

If we reduce iridium, in the humid way, by formic acid, it is soluble in aqua regia; not so when reduced in the dry way.

10th. PLATINUM, PALLADIUM and RHODIUM show the same behavior.

11th. COPPER—If it has been reduced by hydrogen below red heat, changes in the air in a short time into oxide, and if rubbed with sulphur it ignites, forming sulphuret. But if the copper has been reduced at red heat,

it can be kept for years without changing, and cannot be combined with sulphur without applying heat.

**12th. IRON, COBALT, NICKEL.**—If reduced by hydrogen below red heat, and after cooling exposed to the air, oxidize and ignite. To avoid spontaneous combustion, we throw them immediately into water; they will ignite, however, if we dry them afterwards. This behavior does not apply to iron that has been reduced at red heat. If we reduce phosphate of iron before the blast, by means of coal, we obtain a regulus of phosphide of iron. Now, although the iron and the phosphorus both possess great affinity for oxygen, still this phosphide of iron oxidizes with difficulty at red heat; is not acted on by weak acids; even nitric acid will only oxidize it when reduced to a fine powder, and boiled for a considerable time with the acid.

**13th. MANGANESE.**—If reduced by coal before the blast, oxidizes in the atmosphere and even under water (evolving hydrogen); but by reducing the manganese together with silica, we obtain a regulus containing from six to eight per cent. of silicium; and this does not oxidize even at red heat, and is not acted upon even by aqua regia. The silicium, therefore, in its condition of *b* silicium has the power to change the manganese likewise into *b* Mn.

This is also the reason why many silicates with powerful bases (alkalies, earths, oxides of iron, manganese, etc.) appear quite indifferent to the most powerful reagents in the humid way.

We may arrive at the conclusion that all the elements are capable of assuming the state of indifference (*b*), and that this condition, *b*, if we cannot produce it in a certain body by itself, can still be obtained by connecting the same with another element, which more easily enters into that condition, and subjecting the compound to a treatment capable of changing the latter into that state. For this reason, the connections of the peroxide of tin, titanio, tantalio, silicio, and other acids, with the basic oxides, yield the bases very easily if they have been prepared in the humid way; but if these combinations by red heat have been transmuted into the condition of *b*, we are no more able to extract even a trace of the bases, since the radical of the acid, in assuming the condition of *b*, has caused the radical of the bases to assume the same condition.

**14th. NITROGEN.**—This shows a complete indifference, since it exists always in the condition of *b*. It is, therefore, impossible to unite nitrogen immediately with either oxygen, hydrogen, chlorine or carbon. To obtain these combinations, the nitrogen has to be changed into nitrogen *a*.

The combination of nitrogen with carbon is difficult of combustion, because the nitrogen has transmuted the carbon into carbon *b*.

The phosphide of nitrogen is difficult to ignite for the same reason, etc., etc.

The result of these considerations by Berzelius is the idea, that most likely we shall succeed in changing the charcoal into diamond, by separating the carbon out of its connection with nitrogen, for the reason that the latter being itself one of the most indifferent bodies in forming connections, or, as Berzelius expresses it, being always in the condition of *b* or *g*, did most likely change the carbon into the same condition. In confirmation of the above supposition, I wish to lay before your readers the result of some experiments made a number of years ago by some celebrated chemists.

If we heat in a closed vessel the sulphocyanides of iron, copper, lead, zinc, bismuth, silver, tin, or manganese, there escapes nitrogen and bisulphide of carbon, and the residuo is a simple carburet of the metal employed. If we treat in the same manner the cyanides of the same metals, nitrogen escapes and the metal remains as double carburet. Those carburets of metals form a tender, dark powder, which easily ignites, but cannot be fused nor dissolved. But if we put the above cyanides or sulphocyanides in a perfectly dry state in a glass tube, whose end he bent in a right angle, place the same in a small sand-bath, heat it until decomposition commences, but at the first appearance of decomposition, moderate the heat to the lowest possible degree that will still keep up the decomposition, and continue that gentle heat, until it be completely decomposed, we do not obtain the carburet as a black amorphous powder, but as bright, transparent, colorless crystals or grains, which resemble the diamond in appearance, and cut glass.

**OPPOSITION TO PANAMA.**—The Nicarangua Steamship Company announce their intention to dispatch the steamship Oregonian for Panama, on Monday, the 25th instant, to connect by way of the Panama Railroad with the steamer Nebraska for New York. The steamers in the Nicarangua line will be kept on their regular trips as at present.

## Scientific Miscellany.

**THE PHILOSOPHY OF THE SOAP BUBBLE.**—Simple and evanescent as is the little soap-bubble, it has nevertheless attracted a large share of attention from scientists. Even the great Sir Isaac Newton did not consider it beneath his careful study. In our own time, Prof. Henry, Sir David Brewster, and Sir William Thompson, have each devoted more or less time to this study. The latter named gentleman has recently remarked that the mechanical questions involved in the seemingly simple operation of blowing soap bubbles are amongst the greatest enigmas to scientific men. The extraordinary expansion and adhesion combined in these little vapor spheres are well worthy of the fullest investigation. Prof. Henry has calculated that the elastic tension of the thin film of the soap-bubble, is equal to several hundred pounds to the square inch.

In our issue of January 23, 1866, we gave a full account of the philosophy of the soap-bubble; but the progress of investigation since that time appears to have pretty effectually upset the previous conclusions with regard to the cause of its color and the noticeable variations thereof. Heretofore the varying colors of the soap-bubbles have been attributed to the constant variations in their thickness. In reference to the new theory we append the following:

At the late meeting of the British Association for the Advancement of Science, Sir David Brewster read a paper on this subject from which it appears that he had been led to make some new investigations as to the cause of colors of soap-bubbles, after he had repeated the beautiful experiments of Prof. Plateau "On the Equilibrium of a Liquid Mass without Gravity." In these cases the colors of soap-bubbles were presented to him upon soap films, plain, convex and concave; but the changes of form which they underwent and their motions upon the film itself, were incompatible with the common theory of their formation. After describing various phenomena emitted by the ordinary soap-bubble, and also with the bubble having its film toughened by a mixture of glycerine, Sir David remarked that his experiments were sufficient to establish the almost incredible truth that the colors of the soap-bubble are not produced by the thickness of the film itself, but, by the secretion from it of a new substance flowing over the film and expanding, under the influence of gravity and molecular forces, into colored groups of various shapes and returning spontaneously, when not returned forcibly, into the parent films.

So much for the color; but no one has ever yet ventured even a theory to explain how the presence of saponaceous particles can give the enormous cohesive power known to exist in the soap bubbles.

**LIMITS OF THE HUMAN EAR.**—The limits of hearing are different in different persons. Dr. Wollaston, to whom we owe the first proof of this, while endeavoring to estimate the pitch of certain sharp sounds, remarked in a friend told insensibility to the sound of a small organ-pipe, which, in respect to acuteness, was far within the ordinary limits of hearing. The sense of hearing of this person terminated at a note four octaves above the middle E of the piano-forte. The squeak of the bat, the sound of a cricket, even the chirrup of the common house sparrow, are unheard by some people, who, for lower sounds, possess a sensitive ear. The ascent of a single note of sound is sometimes sufficient to produce the change from sound to silence. "The suddenness of the transition," writes Wollaston, "from perfect hearing to total want of perception, occasions a degree of surprise which renders an experiment of this kind with a series of small pipes among several persons rather amusing. It is curious to observe the change of feeling manifested by various individuals of a party, in succession, as the sounds approach and pass the limits of their hearing.

**HEAT FROM GUNPOWDER.**—A gramme of gunpowder burned in a hermetically sealed vessel generates a sufficient quantity of heat to raise the temperature of 40.7 grammes of water 1.14 deg. Centigrade. Hence the combustion of one gramme of powder will raise nearly 644 times its own weight of water one deg. Centigrade.

**THALLIUM OXIDES AND OZONE.**—Schönbein states that ordinary oxygen is without action on protoxide of thallium, while ozonized oxygen combines rapidly with this oxide, and forms the peroxide of thallium, which is brown. Paper steeped in a solution of protoxide of thallium and exposed to the free air would be an excellent test for the presence of ozone, if the carbonic acid of the air did not transform the oxide into carbonate, which passes more slowly to the state of peroxide and blackens with difficulty under conditions where strips of paper iodized and starched, became colored at the end of a few minutes in an atmosphere containing only one two-hundred-thousandth part of ozone. However, it will be found advantageous to use both the oxide of thallium and the iodized paper as ozone tests.

**MAONETISM.**—In a discussion on this subject before the British Association, Sir William Thomson took exception to the remark that magnetism, like electricity, distributes itself upon the surface of bodies. The same statement had been made by authors of repute, but it only added proof of the fact that in many popular books there were statements not merely false in theory, but false as being in direct opposition to facts published many years ago. Harlow, in experimenting with bars of iron, found, long ago, that the magnetic influence was not discoverable. His experiments were not carefully made, yet he rashly stepped to the conclusion that magnetism resides at the surface; and, although it was soon proved incorrect by a celebrated mathematician, this statement has been the fruitful parent of many fallacies.

**CADMIUM AS A PRECIPITATE FOR SILVER.** Mr. Clausen, of Paris, states that silver is wholly precipitated by cadmium; when dealing with a nitric solution of silver, evaporate to dryness in the presence of sulphuric acid, dissolve the sulphate of silver in boiling water, plunge into it a plate of cadmium, and the reduction of the silver takes place at once. The silver is deposited in a compact mass, easily washed with water, as it may contain a little cadmium; boil it in the acid liquid until no hydrogen escapes; wash it until the water contains no sulphuric acid; then dry and calcine. The silver, at first a dry gray, takes the metallic lustre. It may then be weighed; the results are very exact.

**NEW COMPOUND OF GELATINE.**—It has been found, says the *English Mechanic*, that the addition of glycerine to gelatine imparts to it new, curious and useful properties. Mixed with glycerine, gelatine solidifies on cooling, without losing its ductility, and answers well for hermetically sealing bottles. For this purpose it is merely necessary to plunge the neck of the bottle, after it has been corked, into the heated mixture, and after allowing it to cool, repeating the dipping until a sufficiently thick coating is obtained.

**UNIVERSALITY OF NICKEL AND COBALT.**—Weiske has examined iron obtained from every possible source, for nickel and cobalt, and detected in almost every case the presence of these metals. Their amount varied greatly: the average quantity may be said to be seven grammes in the hundred weight. Taking this quantity as a mean, and computing the yearly production of iron at seven and a half million of tons, the annual yield of these metals amounts to one million of kilogrammes.

**THE ANEROID BAROMETER.**—Dr. Stewart, of the Kew Observatory, has made a series of experiments with this barometer, under different pressures, and concludes that on taking this barometer up a mountain 12,000 feet high, it would indicate the true height within 300 feet. There are, however, serious objections to the metallic barometer, not fully set forth by Mr. Stewart, which should prevent its use for strictly scientific purposes.

**TO PRESERVE PEGGED BOOTS AND SHOES.** It is said that if pegged boots are occasionally dressed with petroleum between the soles and the upper leather, will not rip. If the soles of boots or shoes are dressed with petroleum they will resist wet and wear well. The pegs, it is said, are not effected by dryness after being well saturated with the liquid.

**CHARCOAL** produced from rice, starch, albumen, blood, or leather, will produce no detonation when inflamed with niter.

**MORE PEAT.**—The *Territorial Enterprise* is informed that the Central Pacific Railroad, above the Sink of the Humboldt, will run for fifteen miles through a peat-bed, with several miles of peat on either side.

## Mechanical.

**VIBRATION.**—All matter is subject to vibration, consequently this phenomena will be observed more or less in all engineering works. Whether a stone arch or an iron arch is erected, it is subject to vibration. The vibratory effect of a railway train moving rapidly over solid ground may be felt at a distance of one mile. "The action of a large hammer," says Roehling, "I have frequently felt distinctly across a wide river." If a bell is struck, intense vibrations are produced, and their successive waves are transmitted through the medium of the air miles away. Intense as these vibrations may be, if the mass of the bell is large, its body as a whole, in a responding position, may remain perfectly at rest. The sound produced is the result of molecular movement, not visible to the eye. If the air could be perfectly exhausted, no sound whatever could be produced. Iron railway bridges, when traversed by ponderous trains, are subject to the same kind of vibration. And the intensity of these vibrations will also be in proportion to the massiveness of the structure. A tubular bridge will be subject to greater vibrations than a lattice, and a lattice more than a suspended girder or truss. The more divided and broken the mass is, the less intense will be its vibration. Suppose an elastic substance, cloth, felt, or india-rubber, was laid between the joints of a lattice bridge, this would effectually break vibrations, and save the structure. Of course substances would weaken the structure mechanically, and they are therefore inadmissible, but I mention this simply by way of illustration.

The late experiments of Prof. Tyndal have rendered this movement of the air molecules visible to the eye, through the medium of a gas flame. The fact was fully established, however, before, by the proof that sound cannot pass through vacuum. If a small bell he suspended under the receiver of an air-pump, and rung by clock work, its sound will gradually die away as the receiver is exhausted of its air.

**IRON SHIP BUILDING.**—Attention is being called to the fast increasing percentage in the number of English built iron vessels which have foundered at sea within the past few years. The reasons assigned for this increase of casualties are: first, the increased length over those which were built when iron first came into use; but the chief cause is attributed to the inferior strength and thickness of the iron which is now used. It is not unfrequently the case that builders who formerly employed plates three eighths thick are now contenting themselves with iron only three sixteenths of an inch in thickness, while the strength of the angle iron employed has been reduced in the same proportion. It has been stated that the weight of iron and wood used for a given tonnage is fully one-third less than that considered necessary a few years ago. An iron ship of proper thickness of plates will stand much harder humping than a staunch built wooden one; but iron of inferior quality, or too little thickness, is much less safe than an inferior built wooden ship.

**WHEN AN UNDERSHOT WATER-WHEEL IS** not required to work both ways, it appears, from the experiments of De Parcieux and Bossut, that a decided advantage is gained by inclining the float-boards toward the advancing stream, at an angle of twenty degrees to the radius of the wheel. The water then becomes partially heaped up on the float-boards, and acts by its gravity as well as its momentum; they also leave the retiring stream with less resistance.

**THE AMERICAN GUN TRIUMPHANT.**—The English now acknowledge that the American 15-inch Rodman gun has no superiority in its penetrating power—no iron or steel armor yet invented is capable of resisting it.

**WHEN TO APPLY PAINT.**—Paint, to last long, should be put on early in winter or spring, when it is cold and no dust flying. Paint put on in cold weather forms a body or coat upon the surface of the wood that becomes hard and resists weather, or an edge tool even, like slate.

## New Patents and Inventions.

Under this heading we shall mention, from week to week as occasion may demand New and Important Inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent Issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

## PATENTS RECENTLY ISSUED.

69,788.—GATE.—Daniel Flint, Sacramento, California:

I claim the combination and arrangement of a crocheted hinge, F, with forked arms and the cords, G, G, and weights, I, I, with the automatic catches, N, N, all substantially as described and for the purposes as set forth.

The object of this invention is to provide an improved gate, so constructed and arranged that it may be opened and closed without alighting. It consists of so balancing the gate and attaching it at an angle to the post upon which it hangs that, by pulling cords to which weights are attached, the gate will open and close. To do this the inventor employs any common single gate, having a high swinging post, which is hitched to a main stationary post by a hook and eye, the top of which is over the main post. A crotch is attached loosely, by vertical pins, to the top of the main and gate posts, allowing it to swing to and fro as the gate opens and shuts. To the ends of the crotch are connected forked arms to which cords are attached, passing through stationary wings placed in the post at the right and left of the gate. On the center or latch post, upon a horizontal cross-bar, are placed two automatic catches, with a sufficient space between to hold the latch.

69,819.—AXLE-TREE FOR WAGONS.—George P. Kimball, San Francisco, Cal.:

I claim the combination with a superposed wooden axle-hed of the steel plate or spring axle-tree, A, constructed and arranged for operation substantially as herein shown and for the purposes set forth.

69,900.—HAT VENTILATOR.—Charles Henry Coffin, San Francisco, Cal.:

I claim, as a new article of manufacture, a hat ventilator, provided with a slide or valve to close the openings, and a flange of flexible metal teeth for fastening it to the hat.

The object of this invention is to provide a ventilator for hats, so constructed that it can be opened and closed at will, and easily removed from a hat that has become worn or unfashionable, and readily attached to a new one; it may also be composed of such material as will not corrode or discolor the hat in case it is of a light and delicate material. It consists of a thin plate, with a scooped edge, composed of any material which will allow of gilding or plating or of pure silver, having radial perforations.

69,947.—LAYING TELEGRAPH WIRE ON RAILROADS.—D. W. Stroug, Dutch Flat, Cal.:

I claim the slotted bracket or holder, D, for retaining and protecting the wire, substantially as described.

The object of this invention is to provide an improved method for laying telegraph wires, which are used on lines of railroad, for the purpose of securing them against the danger of accidents and delays, or from limbs of trees breaking the wires. In order to effect this the inventor constructs the wire with an insulating covering to protect it from contact with its attachments, and in that condition places it along the side of the rail, supported by properly constructed brackets placed as often as may be found necessary upon the railroad sleepers. These brackets are made to fit the side of the rail, and have slots or openings, through which one or any number of wires may be made to pass, thus securing them firmly and protecting them from danger.

## RECENT INVENTIONS.

PRINTING AND STEROTYPING BY A NEW PROCESS.—Mr. J. B. Elliot, of New York, is engaged in perfecting a new process for printing and stereotyping, by which the use of types is dispensed with and the operation of preparing matter for the press is greatly facilitated. His apparatus consists of an instrument provided with keys, like those of a piano, each key being arranged to

operate a letter die. A sheet of soft paper, made for the purpose, is placed in the machine, and by operating the keys, impressions of letters are made in the paper. At the same time, the paper is caused to move appropriately after each impression, so that impressions of letters to form words, and words to form lines, and successions of lines to form sentences, are appropriately made. After the paper has been thus stamped with the matter for a hook or newspaper page, it is used as a matrix or mold from which a stereotype is taken, and this is used like an ordinary stereotype plate for printing. The invention has been exhibited at the Paris Exposition, and received a gold medal and the most gratifying notices from the European press.

PREPARED WOOD.—ANOTHER INVENTION. Louis S. Robbins, of New York, has perfected an invention for rendering wood durable, which, it is claimed, if used by railroad builders, will save \$20,000,000 a year, in the aggregate, in behalf of the railroads in this country.

A RAILWAY NOVELTY.—A Russian engineer exhibits a railway invention. The object is to save the power gained in a descent, now lost in the friction of the brakes, with wear and tear, and use it in an ascent. To do this, the engineer has attached to the locomotive two very heavy fly-wheels. Going down hill they act as a break, and the force they gather will carry the train up an equal rise, less the friction. Here a model train loaded with water runs down a sharp incline, the water runs off, and the force of the fly-wheel carries the train back to the place of starting. In this way a short line, taking coal down an incline—from the pit's mouth for example—could be worked without any power but that gained by each descent of the train.

NEW KNITTING MACHINE.—A Mr. Hinckley, of Norwalk, Ohio, has invented a knitting machine quite novel in character, which will knit all kinds of goods from suspenders to quilts. It has few parts, and knits flat with a selvedge or round; it widens and narrows; there is only one needle, which is similar to the needle of a sewing machine; it will take a great many different kinds of stitches, which can be changed while in operation, and it has a self-spooling apparatus. It can be sold for \$25, and is said to embody the true principles of what a family knitting machine should be. Instead of a needle for each stitch, as is usually employed in knitting machines, only one needle is employed in this machine, which is threaded the same as the needle in the sewing machine. It will knit at a high rate of speed, and knits hosiery with heel and toe complete. It will knit the button-holes into the garment! One good feature in connection with it is, that all the work is at all times in full view of the operator.

CALIFORNIA LIFE INSURANCE.—We take pleasure in calling the attention of our readers to a letter which appears to-day, from Mr. Mooney, addressed to the editors of the *Alta*, not only for the importance of the subject matter to this community and to the inhabitants of the whole coast, but also for the valuable statistical matter the communication contains. A few men possessed of the business tact and energy of Mr. Mooney, can do much in embarking in an undertaking of the kind here presented in keeping our capital at home, to build up our own mechanical industry and develop the mineral and agricultural interests of this coast.

We are also pleased to notice that other prominent parties are about to embark in a similar enterprise. Among the parties interested in this second movement, we notice the names of Alonzo Hayward, Charles McLain, W. C. Ralston, S. F. Butterworth, Oliver Eldridge, L. L. Robinson, and others. The argument in favor of local insurance companies is full as strong as that in favor of the great body of our local and home industries. The money they receive will all be retained and invested here. This movement may be considered as a new element toward the consolidation of financial influence for the development of this coast.

FILLING UP OF EASTERN RIVERS.—A Board of U. S. Engineers, who have recently been employed in surveying the Penobscot river, in the State of Maine, report that the bed of that river is fast filling up with sawdust and slabs from the numerous lumber mills along its banks. Probably other rivers in that densely timbered region are also filling up from a similar cause.

## Weekly Stock Circular.

Of Associated Brokers of the S. F. Stock and Exchange Board.

SAN FRANCISCO, SATURDAY MORNING,  
November 16, 1867.  
CITY STOCKS.

City shares continue inactive. California Steam Navigation stock commanded improved rates, a few shares changing hands at 78 per cent. The usual monthly dividend of 1½ per cent. on the capital stock of this company is payable since yesterday. In the open session of the Board, San Francisco Gas stock realized \$66, seller 3. National Insurance stock sold at \$66.50. In city railroad stocks we note sales of Sutter Street at \$11, and Central at \$45. North Beach is held at \$53. Both the Central and North Beach companies pass their dividends for the present month. For Spring Valley Water stock \$66 is bid. The usual monthly dividend of ½ per cent. is payable to the stockholders since the 11th inst. We quote State Telegraph stock at \$30 bid and \$31 asked. A dividend of \$1 per share is payable on the outstanding stock of this company since yesterday.

Yesterday the Bank of California disbursed its usual monthly dividend of 1 per cent. on its capital stock.

## MINING SHARE MARKET.

The mining share market presented no new feature this week until near the close, when quite encouraging information was received from several claims on the Comstock Lode, which we give in detail below. This is producing a reaction in the market, and most descriptions show an upward tendency; however, some "shorts" being required to fill contributed somewhat to the advance. A much better feeling prevails, and we would not be surprised to see a greatly improved market at an early day.

CROWN POINT—has been for the most part inactive, opening at \$540, then selling at \$610, assessment delinquent, and at the close \$570 is bid. The north drift on the 700-foot level has been carried 125 feet from the forks, making a distance of about 150 feet from the shaft, and the south drift is 112½ feet from the forks.

HALE & NORCROSS—exhibited considerable improvement early in the week, rising from \$840 to \$900, seller 3, gradually receding to \$760, then selling at \$775, and closing at \$860. We are informed that the average yield of the ore so far during the present month shows a very favorable gain as compared with the October returns. The actual bullion product for the month of October was \$49,980.

GOULD & CURRY—has been in limited request during the past week, improving from \$300 to \$375, declining to \$310, rising to \$400, s. 5, and closing at \$365, s. 30. The rapid appreciation of this stock at the close is attributable to the discovery of a seam of quartz in the east drift, on the sixth station.

CHOLLAR-POTOSI—has been less active at declining rates, opening at \$125@130, receding to \$118, and closing at \$128. We learn of nothing of special interest concerning the developments in this mine since our last reference. The yield of bullion in October amounted to \$165,000, against \$252,000 in September.

SAVAGE—continues quite active, selling within a range of \$95@107.50, then at \$91, and closing at \$106. At the close, a dispatch has been received stating that they "struck very good ore in the east cut from the south winze, third station. North drift, fourth station, improving."

KENTUCK—has been freely dealt in, advancing from \$123 to \$141, declining to \$123, rising to \$149 seller 30, and closing yesterday at \$137. Fifty tons of ore per day are now hoisted through the Kentucky shaft, showing a very good average assay, and twenty-five tons are supplied through the Yellow Jacket shaft, producing an average yield of about \$30 to the ton. The annual meeting of this company takes place on the 27th inst.

IMPERIAL—has been largely dealt in under a rapid advance, improving from \$138.50 to \$163, and closing on the 15th at \$155. The discovery of a body of ore on the 370-foot level, which it is said will afford a six months' supply for both mills, produced the recent very material advance in this stock.

YELLOW JACKET—opened at \$350@375, then sold at \$460, assessment of \$100 per foot delinquent, and closed at \$382.50. Work on the shaft continues uninterrupted, and it is believed that the developments from the new level will greatly enhance the value of the stock... EMPIRE advanced to \$190, and closed at \$175.

OVERMAN—advanced from \$44 to \$48, declined to \$42.50, and closed at \$44. This mine at present yields about fifty tons of low grade ore per day... BELCHER sold at \$120@123, then at \$105, and at the close \$120 is bid. The *Trespass* says that drifting continues toward the Crown Point line, with no new developments... CONFIDENCE was in the market at \$36 seller 3.

GOLD HILL QUARTZ—has advanced to \$90 per share. The rock shows an improved average yield—nearly \$30 to the ton—and it is thought that the hullion product of the current month will exceed any previous like period. The ore is mainly obtained from the west drift on the 290-foot level.

BULLION—sold at \$6@8; at the close we quote it at \$6 bid and \$8 asked. Assessment of \$10 per share will be delinquent on the 21st inst... SEGREGATED BELCHER brought \$3.50... DE SOTO, \$5... We quote SIERRA NEVADA at \$6 bid, \$7 asked. An assessment of \$4 per share was levied by the Trustees on the 13th instant.

The aggregate sales of Stocks, Legal Tender Notes, etc., at the regular sessions of the Board since Saturday last, amounted to \$1,015,235. The sales in the open sessions amounted to \$237,806, showing a combined aggregate to date during the past week of \$1,289,041.

NEW INCORPORATIONS.—Articles of incorporation have recently been filed in the County Clerk's office in this city as follows:

ASSOCIATED HOMESTEAD ASSOCIATION—San Francisco. Nov. 9th. Capital stock, \$26,400; 44 shares, \$600 each. Trustees: Joseph Scheyer, George Haas, J. Guthbert, James Smith, Thomas Price, James Thompson and J. B. Chase.

ELECTION OF OFFICERS.—SOUTH SAN FRANCISCO DRY DOCK CO.—San Francisco. Nov. 12th. H. F. Williams, President; Alexander G. Abell, Vice-President; Joseph DeForest, Treasurer; A. S. Gould, Secretary; Edward Tompkins, H. Rosekrans, Capt. W. W. Neal, Henry O. Howard, J. B. Knapp, William C. Bryan, Thomas Anderson, W. H. Ladd, Stephen L. Piper, Trustees.

MARKET STREET HOMESTEAD ASSOCIATION.—J. S. LUTY, Secretary. Office, 305 Montgomery street, corner of Pine, San Francisco. 2v15

BUSINESS NOTICE.—Mr. A. T. Dewey, of this journal, contemplates a visit of several months in the Atlantic States, a portion of which time he will spend in Washington, New York and Boston. Any of our Eastern friends who wish to communicate with him, for business or other purposes, will address their letters to "Westfield, Mass."

JACOB SNEW, Pioneer Photographer, 612 Clay street, north side, four doors above Montgomery, (late 316 Montgomery street), has all kinds of Photographs in the best style of the Art. He would invite especial attention to the new "Cabinet Photographs," which he is taking to perfection. 16v14tf

SECRETARYSHIP FOR MINING COMPANIES.—A gentleman of education, ability and experience, is desirous of procuring a position as Secretary, or Assistant Secretary, in some good Mining Company. Has most unexceptionable references. Address "SECRETARY," at this office. 6v16tf

Save Your Teeth.—Do not have them extracted without first consulting a good Dentist. The loss is irreparable, and, in many instances, unnecessary. DR. BEERS, corner of Pine and Kearny streets, makes a specialty of filling the fangs of dead Teeth, and building up broken crowns with PURE GOLD—thus restoring them to their original usefulness and beauty.

Call and examine the work. Finest quality of artificial work also manufactured. 16v14tf

American and Foreign Patents.—Letters Patent for Inventors can be secured in the United States and foreign countries through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past two years.

KING IRON.—Gold and cotton have each, in turn, been awarded the high position as king among the productions of the earth; and right royally, too have they worn their honors. But there has recently arisen a new aspirant for kingly prerogatives. Iron has lately come forth from the bowels of the earth in such quantity, and by its superior merits insinuated itself so much more largely than formerly into the multifarious uses of mankind, that we can now rightfully assert its claim to a share of sovereignty, if, indeed, it must not be allowed the highest post of honor. While we would still be loyal to its predecessors, we should in every sense rejoice, that in those latter days so useful and so universal a product as iron is being duly appreciated. It is most remarkable, as well as instructive, to see how Providence provides and enables man to adopt the various instruments of utility with which the earth abounds, just as the advancing state of society seems to call for them. Time was when a universal medium of exchange was the most needed, and gold came forth,—iron was but little used, but little needed. Coal and cotton succeeded in just the point of time when we do not see how we could have well done without them. And now we have iron. Wood is rapidly passing away. The earth is needed for the sustenance of man, and man no sooner realizes the fact, than the substitute is made plain; it comes forth in quantity previously unthought of, and at prices which place it within reach of everything for which it is applicable.

All About Sending Money by Mail.

RATES OF COMMISSION.—The following are the rates charged (in currency) for transmitting money to any part of the United States:

On Orders not exceeding \$20, . . . . . 10 cents.
Over \$20 and not exceeding \$50, . . . . . 25 cents.
No fractions of cents to be introduced in an Order.
United States Treasury Notes, or National Bank Notes only received or paid.

To send over \$50, additional Orders must be obtained.
Postal Office where Money Orders may be obtained will furnish blanks as follows, which the applicants will fill out:
No. . . . . Amount . . . . . Date, . . . . . 188 . . . . .

MONEY ORDER.
Required for the sum of \$ . . . . . Payable at . . . . .
State of . . . . . Payable to . . . . . Residing at . . . . .
State of . . . . . Sent by . . . . .
Residing at . . . . . State of . . . . .

ENTERED IN REGISTER: . . . . . Postmaster.

The applicant must, in all cases, write his own given name and surname in full, and when the given name of the payee is known, it should be so stated; otherwise initials may be used. The given names of married women must be stated, and not those of their husbands. For example: Mrs. Mary Brown must not be described as Mrs. William Brown.

Names of parties and places, and the sums, to be written in the plainest possible manner.
As there are several places of the same name in the United States, applicants must be careful to indicate which of them they mean, and the Postmaster will satisfy himself, before writing out the order, that the place indicated is the one intended.

List of Money-Order Post Offices in the Pacific States and Territories, May 20, 1867.

Table listing Money-Order Post Offices in California, Nevada, Oregon, Idaho Territory, and Montana Territory. Columns include Office, County, Office, and County.

Table listing Money-Order Post Offices in Washington Territory. Columns include Office, County, Office, and County.

MINING SHAREHOLDERS' DIRECTORY.

[Compiled for every issue, from advertisements in the Mining and Scientific Press and other San Francisco Journals.]

Comprising the Names of Companies, District or County of Location; Amount and date of Assessment; Date of Meeting; Day of Delinquent Sale; and Amount and Time of Payment of Dividends.

Table with columns: NAME, LOCATION, AMOUNT, AND DATE OF ASSESSMENT, and DAY OF DELINQUENT SALE. Lists various mining companies and their financial details.

\*Those marked with an asterisk (\*) are advertised in this number.

MINING COMPANIES

Can get their Printing done cheaper and better by TRUESDELL, DEWEY & CO.

Than at any printing establishment in the city.

COUNTY OFFICERS

Can get their Blank Books and Blanks cheaper of TRUESDELL, DEWEY & CO.

Than of any other printing house in the city.

MERCHANTS

When you want Printing done cheap, send to TRUESDELL, DEWEY & CO.

Who do all kinds of Printing at the lowest rates.

FOUNDRIES

Will save money by having their printing done by TRUESDELL, DEWEY & CO.

Who have put prices down to the lowest rates.

EVERYBODY

Who wishes to save money and get good work, see TRUESDELL, DEWEY & CO.

Who are always ready to receive and fill orders.

MANUFACTURERS

Can get their Printing well done at low prices, by TRUESDELL, DEWEY & CO.

Who are now prepared for all kinds of Printing.

TRUESDELL, DEWEY & CO.

BOOK AND JOB PRINTERS, MINING & SCIENTIFIC PRESS OFFICE

505 CALY STREET, SAN FRANCISCO.

ESTABLISHED 1849. (MAX, 1850.)

VOLUME FIFTEEN OF THE Mining and Scientific Press, COMMENCING JULY, 1867.

AN INSTRUCTIVE BOOK!

Prof. LAYRES' ELEMENTS OF COMPOSITION, BELES-LETTRES AND ORATORY

For Scholars, Teachers, Lawyers all Professional Persons, and those of Common Education, who would improve the Eloquence and Effectiveness of their Composition and Manners of Address.

Price, postage paid, . . . . . \$1.10

This is a new publication, and in style and treatment of this important subject, is original, simple, plain and comprehensive. The author, Prof. LAYRES (a meritorious Teacher of good standing in California, and a sound thinker and reasoner), in his preface says: "The method pursued by the Author in developing the subject of Composition, is both the synthetical and analytical. The former is necessary to teach the theory, the latter the practice of the art; and as these are both indispensable to the scholar, so are also the two methods, as the sequel will show."

The Work has lately been approved and authorized by the State Board of Education for use in the Public Schools. To further illustrate the varied and popular endorsement the book has so rapidly received, we quote the following RECOMMENDATIONS:

It is simple, concise, and well arranged. It seems to be a work of great value.—John Seely.
I am prepared to concur in the recommendation of the honorable Superintendent of Public Instruction.—J. C. Felton.
After a careful and thorough perusal of the same as it was in my power to give, I came to the conclusion that, for equal advantages, correctness, and precision of definition, as well as for compactness and simplicity of style, it was and would be, without a rival. I regard your work as the best of its kind. I know of but few men in any profession who would not be benefited by its careful study.—Wm. H. Hill.

I regard it as one of the best treatises upon these important branches—perhaps the only one obtainable possessing equal advantages in a plain and simple style, and in its conciseness, and of such simplicity in its arrangement as to be readily understood by the advanced pupil.—F. W. Hatch.
It is admirably arranged to develop the correct idea of the analysis and synthesis of language, and the application of ideas into sentences and periods. The style is clear, terse and pleasing. I do not hesitate to recommend it as a best acquisition to our text books.—James Deane.

I am happy to express my conviction of the value of the work. It would give me much gratification to see so thorough and excellent a treatise emanate from young California.—Martin Kellogg.
I recommend it to all those who wish to obtain a book that will give them definite ideas on this subject, and teach them to express their thoughts and feelings in a clear, simple, and forcible manner.—Caroline L. Atwood.
I regard the book about to be published as far superior to any work extant upon that subject.—Wm. S. Lund, A. M.

I believe the work will be a valuable and much needed addition to our school text-books.—Herman Perry.
You have brought the results of a profound analysis, and made them available, in a practical form.—I. H. Drayton.
I can recommend it particularly to my young friends of the legal profession, as a source from which they may be able to learn much of value as special plunders and advocates at the forum.—John Curry.
The subjects upon which you treat have heretofore been too much neglected in the education of young men in America. Exactly calculated to interest. It will soon become a necessity in every lawyer's library.—Charles A. Tuttle.

Its clearness and comprehensiveness make it easy.—G. W. Boker.
A gentleman of varied learning and ripe culture, who has half a dozen languages at his tongue's end. He seeks to teach the student not only how to take sentences apart, but how to construct them. His system has the merit of originality. We know of no work in which can be obtained so lucid an exposition of the elements of composition, and such valuable assistance in learning how to put his ideas into language. Prof. Layres has done the cause of popular education good service.—S. F. Bulletin.
This is a San Francisco book by a San Francisco author. It contains 166 pages, and is altogether creditable to San Francisco. It meets a public want, and meets it in a form and size cheap and convenient, and in reach of the humblest.—Alta California.

The writer, the lawyer, the minister, or the statesman, may study its rules and definitions with profit. Nothing conduces more to the purity of a national literary taste than a general and thorough knowledge of the rules by which the construction of language is governed.—S. F. Times
Prof. Layres plunges at once "in medias res." He seizes a sentence (which is the unit in composition), whether written or spoken, holds it up before you; tears it in pieces before your eyes—or rather, we should say, neatly and skillfully dissects it—displays one by one its several parts, throughout the thoroughly acquired and equalled quantity; and then shows you how to put them together again. A series of such experiments, increasing in complexity so gradually that you do not feel the difficulty, and the thing is done: you are master of the subject.—Mining and Scientific Press.

Its design is to show that ideas can be so arranged as to increase their power; in short, to teach the mechanism of composition, eloquence and oratory. A desideratum long felt is supplied.—S. F. Examiner.

This is an ease in which the occasions are rapidly multi plying, when educated men, and women, too, are called upon to express their views in writing, either for public or private inspection and criticism.—Stockton Independent.
The most eminent educators in California give it their hearty approval, and we concur.—Marysville Appeal.

Not only one of the best of its kind, but what is still better, one of the briefest. It contains 166 pages.—Virginia Enterprise.

Price, \$1.10. Sent by mail, postage paid, without extra charge. Liberal reductions made to the Trade, Teachers and Schools, ordering by wholesale. Orders received by our Traveling Agents. Address DEWEY & CO., Mining and Scientific Press, San Francisco.

## Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

## CALIFORNIA.

## Alpine County.

*Miner*, Nov. 9th: Two cross cut at points 60 or 70 feet apart, have been run this week into the Merrimack lode, about four feet each, showing good ore all the way.

Considerable prospecting is being done to the eastward of the Comstock, in the direction of the Occidental mine. Several of the leads promise shortly to yield paying ore.

In Silver Mountain District, the Mountain, Pennsylvania, and I X L Co's have their winter supplies laid in, and will prospect their respective claims in spite of the snow. Several other claims there, among which are the Lady Elgin, Balaclava and Lady Franklin, also show symptoms of life and returning activity.

The Mt. Bullion claims, opposite the mouth of Monitor Creek, have recently passed into the hands of a London Co. who have started work for the purpose of running a tunnel.

## Amador County.

*Ledger*, Nov. 9th: We are glad to announce that the Kearsing mill, in this place, is again in operation, after having been idle for some months.

The shaft of the Dictator claim is sunk on the foot wall of the vein which is now seven feet wide; the hanging wall has not yet been reached. The rock has all the characteristics of that taken from the Coney & Bigelow mine, and is literally studded with rich sulphurets. The owners contemplate the immediate erection of a whim, and sinking to the depth of 150 feet before taking out rock for working.

At the Coney & Bigelow works, under the superintendence of Mr. John Agrell, the result has more than met the expectations of the proprietors. Last Monday they melted down the last 28 days' run, and were rewarded by receiving a brick of gold worth \$4,540. This gold is .996 fine, and worth \$20.58 per ounce.

Last Sunday the Oneida made another good clean up—the result being \$12,000 after it was melted down. Thirty additional stamps will soon be pounding away on the rock of the mine, when the "clean up" will prove still richer.

## Calaveras County.

*Chronicle*, Nov. 9th: The rock now being taken out of the Petticoat lead, at Railroad Flat, will pay \$100 per ton.

The West Point correspondent writes: Sletcher and Lightfoot cleaned up 14 tons from the Last Chance claim, which paid \$20 per ton. The Casner & Barnes' last run of 55 tons, paid \$41 per ton; the mill is now running on rock they expect to pay better. Peters, Champion & Co. on Enterprise Flat, have got the old Gouldseu mine in working order, and have out 40 tons of rock that will pay from \$50 to \$80 per ton. The Mina Rica mill has been sold and will be moved away soon.

White & Co. have got their rotary furnace in operation in Harris' mill, but have not yet made any thorough trial of sulphurets by this process. In Railroad Flat, Hepburn & Co. have got a Hess pan in operation at their mill. Cadell, Weihe & Co's last run of 110 tons paid \$15 per ton. Gamhlo & Zane are going down Man Fashion with good prospects, while on the Petticoat they are gouging rich rock along on top and waiting for something to turn up.

San Andreas Register, Nov. 9th: Captain Ferguson says that the quartz veins at San Antonio Ridge are the richest he ever saw in the State. We saw \$134 of amalgam weighed, sold, and paid for, which he took out of five tons of quartz rock, in an arastra. In working the rock he says that he lost half of his quicksilver, and must have lost a great deal of gold, as he knows nothing of working an arastra. There are, in the mining district, ten or twelve shafts, on veins of quartz which will pay from \$12 to \$75 per ton.

George W. Cox, an old resident of El Dorado, has discovered a veritable diamond mine near that place. The stones are very beautiful and peculiar, for one of which he was offered the sum of \$100. He has his pockets full of them, and says he can find bushels of the same kind. He intends testing them, to ascertain if they really are diamonds. Should his investigation prove favorable, it will establish the fact, not only that the age of wonders is not passed, but that here, in Calaveras, lie beds of marvelous riches.

## Mariposa County.

*Mail*, Nov. 9th: We learn that H. M. Bell, of saloon fame at Coulterville, has re-

tired from the world and gone to "doing his own cooking," on account of his quartz vein changing from gold to copper. It is said that he has struck a lead of the pure virgin ore.

The late heavy rains raised the Merced river so much as to threaten the destruction of the Mariposa Co's dam at the Beuton mill, and to suspend work upon it for the time being.

## Napa County.

The Register, speaking of the quicksilver prospects in Napa county, says: Gangs of men are hard at work upon three different claims in Hope Valley, and upon two of them a large quantity of excellent cinuabar had already been taken out, and there is a most flattering prospect of an inexhaustible supply. We were assured by old miners, familiar with quicksilver working, that no mine yet opened upon this continent ever afforded so favorable a prospect at the outset as, at least, one of the claims in question, and from appearances and information, we are confident they are right.

## Nevada County.

Grass Valley National, Nov. 6th: The contracts for running tunnels on the Blue Point Gravel Co's claims have been awarded as follows: For running 500 ft. down grade to Simons & Co. at \$36 per ft., and 400 ft. up grade to Mitchell & Co. at \$28 per ft., making the aggregate cost to the company of \$29,200.

The Empire Co. still continues to take out the richest kind of rock from their mine. Thirty-eight men are at work, and the company are unable, with their 30-stamp mill, to crush all the rock taken out.

Nov. 8th: Several kegs of the richest kind of specimens were taken, on Wednesday night last, from the Dromedary mine, Echo Hill.

Nov. 11th: The Dromedary Co. have just finished cleaning-up, at Gold Hill mill, a crushing of 30 loads of rock from their mine, including the specimens taken out since commencing work. The total cleaned up is between \$6,000 and \$7,000.

From 199 loads of quartz, crushed recently at the Sebastopol mill, from the Illinois and Wisconsin mine, 12½ tons of sulphurets were obtained, valued at \$115 per ton.

Mr. Chas. Leech has disposed of three-eighths of the Illinois mine for \$15,000.

*Gazette*, Nov. 7th: Fourteen loads of quartz from the Seven-Thirty lode, near Deadman's Flat, crushed at the Gold Hill mill, Grass Valley, was cleaned-up on Monday, and yielded 46 ounces in gold. This, at the rate of \$17.50 an ounce, is worth \$805, or at the rate of \$57.50 a load. The rock was taken out at a depth of 96 ft. on the ledge, at which depth no water is met with.

The name of the Mary Etta quartz ledge, recently sold to a San Francisco company, has been changed to "Salathiel" by the present owners.

A promising quartz ledge was discovered a few days ago, on Diamond Creek, a short distance east of the Mary Etta, or "Salathiel." The ledge is some three feet in width, shows much free gold, and gives good prospects.

*Transcript*, Nov. 6th: The shaft on the Caswell ledge at Newtown is down 40 ft., having a ledge five feet wide, the rock of which is looking first-rate, and contains a large quantity of sulphurets and some free gold. A crushing of 10 tons recently had, yielded \$16 per ton. A large amount of rock is now being taken out and another crushing will soon be had.

H. Schardin & Co. are working the Galena ledge with good prospects. It has been opened on to the depth of 46 ft., at which point the ledge is 18 in. wide. The rock prospects well in a hand mortar, and it will soon be tested by mill process. It contains a large quantity of galena sulphurets.

Nov. 7th: In reviewing the work of the season, the Transcript says: The yield from placer claims will, in all probability, be larger than last year. Several new bed-rock tunnels have been completed and large enterprises have been entered upon for opening extensive ranges of gravel. Several large corporations with abundant capital have taken hold of such mines with every prospect for abundant success. Many old claims are also being fitted-up, and miners are only waiting for sufficient water to commence operations. Extensive claims at Sailor Flat, near Blue Tent, have been purchased by parties from Smartsville, Yuba county, and they will be worked this season on a large scale.

Nov. 10th: The old Cozzens & Garher mine on Missouri Cañon, between Red Dog and You Bet, was not long since purchased by Nece & West, and since that time they have run a substantial double-track prospect tunnel under the creek and found first-rate gravel. On next Monday these gentle-

men will commence taking out cement for mill work.

Nov. 12th: On the first of February last, W. D. Smith and eleven other persons took a contract to work the Illinois and Wisconsin mine at Grass Valley, and they have been so successful in taking out gold that they yesterday bought three-eighths of the entire mine. During the last two months they took out \$11,000 in gold.

Grass Valley Union, Nov. 5th: We yesterday saw at A. Delano's hanking-house, in this place, another lot of beautiful quartz specimens from the Empire Co's mine, which were taken out on Saturday evening last. For the lot, embracing four or five pieces of quartz, none of them being large, a good judge of such articles offered \$500 in coin, and the offer was refused. They were certainly the richest-looking quartz specimens we have ever seen in Grass Valley.

EXCELSIOR.—Meadow Lake Sun, Nov. 9th: The shaft on the Enterprise mine has reached a depth of 93 ft. The width of the ledge at the bottom of the shaft has not yet been ascertained, but is the full width of the shaft; at the surface it is upwards of 20 ft. in width. The company intend to run their mine and mill the entire winter.

Gold Hill News, Nov. 9th: The Meadow Lake correspondent writes: "The Kentucky Co. are driving the work ahead on their mine with great vigor. The lower tunnel is now in a distance of 68 ft., and the shaft which is being sunk from the surface above to connect with the tunnel is down 20 ft. They are now erecting a house over the shaft, in order to protect the workmen from the inclement weather of winter. The work is being prosecuted night and day. Quite a number of the mining companies in Meadow Lake intend to winter here, and they are accordingly building warm cabins, and also substantial houses over their mining works, so as to keep in operation, as next summer will reveal some wonderfully rich gold mines here.

## Plumas County.

The Alta of this city has the following: The Crescent mill property, in Plumas county, was sold by the sheriff on Wednesday last for \$45,000. We presume this was the famous Indian Valley quartz mine which, from November, 1862, to the 9th of June last, yielded \$667,213, of which \$100,000 were paid in dividends, and \$150,000 spent in improvements, current expenses having absorbed the rest. The total yield of rock was about 40,000 tons, and the average production per ton, \$16.18. The mill has 32 stamps. There were two mills at one time, but the second mill of 24 stamps, was sold in 1866, and moved to the Whitney mine. The Crescent property includes claims on three veins, two of which, the Crescent and Horseshoe, run east and west 12 feet apart, and the third, called the Pet, runs northeast and southwest, and cuts through both the others. The parallel veins are about five ft. wide each, and the Pet is about half as wide, but the ore is richer than in the others.

## Shasta County.

Courier, Nov. 9th: R. Johnson and a man named Williams have located a claim on what appears to be a copper ledge, near Silver City, on North Cow Creek. The croppings yield a prospect of 70 per cent. in pure copper, and the locators are confident that they will strike a permanent ledge.

## Sierra County.

Downieville Messenger, Nov. 9th: The Trustees of the Tubal Cain Quartz Mining Co., located near the Docile ledge, Alleghany, have let a contract to sink 40 ft. on their ledge, the shaft to be five ft. by seven.

## Yuba County.

Marysville Appeal, Nov. 11th: The Jefferson mine at Brown's Valley, has gone down about 550 ft., nearly all the way in pay rock, which has averaged from \$10 to \$200 per ton. The mine is now owned by a San Francisco company, and from Sept. 13th, 1863, when they commenced work, until Oct. 1st, 1867, the mine yielded \$409,617, and paid \$131,000 as dividends. The production before the present company got possession is estimated at \$130,000. The claim is 780 ft. long, and the mill has 12 stamps driven by steam. The average yield of the rock is now from \$10 to \$15 per ton.

The Pennsylvania mill has 16 stamps, and crushes about 1,000 tons per month. The Dannebrog mine has yielded \$250,000 according to rumor, which avers further that no books were kept for fear that they might be produced in litigation, of which the company have had more than a fair share. The rock yielded from \$15 to \$20 per ton, and the mill has eight stamps. The Sweet Vengeance Co. have a 10-stamp mill; have taken out \$25,000, have put in \$8,000, and are doing nothing just now.

Nov. 12th: The Rattlesnake Co. crushed 60 tons of rock last week, which yielded an average of \$25 to the ton. The Pennsyl-

vania mill is in full operation again, running 16 stamps, and crushing very good quartz. The late interruption in this mine originated from a miscalculation, or a variation in the dip of the pay streak. The superintendent expected to strike it in level No. 9, at a distance of 70 ft. from the incline, but had to go 105 ft. to retap the rich chimney. A similar interruption may never be expected again. Incline No. 2 is expected to supply deficiencies in the future, as the rock is improving every day in quality.

## ARIZONA.

*Miner*, Oct. 26th: The quartz mill of Ryneron & Stone, at Pino Alta, New Mexico, commenced crushing ore recently.

There are about 50 men at work on the Vulture lode engaged in taking out ore, wheeling it away, assorting and piling it up. There is already taken out about 350 tons of first class rock, and about 3,000 tons of second and third class qualities. The mine is the largest and best upon the continent. The rock is of all shades of color, coarse, fine grained and porous. Free gold may be seen in almost every piece, and rich specimens are frequently found.

## ALASKA.

Honolulu Commercial Advertiser, Oct. 12th: By the ship William Gifford we have a report, received from the revenue cutter Lincoln, which was spoken off Sitka, that gold had been discovered back of Sitka, and that the diggings promise to be as rich as any in California or British Columbia.

## COLORADO.

Georgetown Miner, Oct. 24th: A quantity of very fine ore has been delivered at the works of Garrott, Martine & Co. for reduction, from the Cliff lode on Democrat Mountain.

Ore to the amount of \$30,000 have been subscribed for the erection of reduction works at this place.

Some two or three tons of very fine argenteiferous galena ore, from the Chihuahua lode, situated in Colfax Park, Snake River Dist., has been brought over for reduction.

A 16-in. vein of very fine gangue, carrying galena and zinc blende, has been discovered in the Monticello lode, Columbia Mountain. An 8-in. vein of sulphuret of silver lies against the lower wall.

A certificate of assay of ore from the Gen. Fitch lode in West Argentine Dist. has been shown the editor, which places the result obtained at \$1,344.41 per ton silver. The ore is pronounced by Prof. Martine, who made the assay, to be a pure gray and black sulphuret of silver. An assay of 10 lbs. of the ore yielded five ozs. and one pwt. of silver.

We saw, on Monday evening last, in the hands of Mr. Miner, a fine piece of pure silver bullion weighing 3½ ozs., which was extracted from 10 lbs. of Belmont ore. The value of the bullion is \$472½, coin, at the rate of \$950 per ton.

News, Oct. 30th: We saw at the Colorado National Bank, this morning, two bars of gold bullion. The weight of the largest was 27 30-100 ozs., fineness .826, value \$472.10 in coin. The weight of the other was 13 1-100 ozs., fineness .871, value \$236.33 in coin.

A new discovery has been made in Summit Dist., called Soda Gulch, which is yielding richly.

Warren Hussey & Co. sent 260 ozs. of gold dust to the mint this morning. Among the lot were 190 ozs. from the Clear Creek diggings above Idaho, which is said to be one of the finest lots ever seen in this city.

We saw at the mint this morning, a fine bar of gold bullion weighing 200 ozs., and valued at about \$3,000. Four other bars, valued at \$1,600 were also shown us, while down below the smelter was busy at work, and passed to us two fine bars, warm from the fire.

We saw at the Colorado National Bank this morning, a package of gold dust from Gold Run, in Summit county, forwarded by mail.

Times, Oct. 26th: The Excelsior Reduction Works of Krauss, Reese & Bruckner, have lately treated the following parcels of ore: Forty-two tons of Pewabic yielded 61 50-100 ozs. gold; three tons of Bobtail ore, 10 50-100 ozs., and 4½ tons from the Wautoga lode, 7 60-100 ozs. The "California process" keeps steadily at work, and its success as a paying method of treating refractory ores is undoubted.

The recent discovery on Mr. Peter Fleming's claims on the American Flag has not been over estimated. Three men recently took out four cords of ore in three days. The quartz appears rich in free gold.

## IDAHO.

Owyhee Avalanche, Nov. 2d: The Lincoln mill will be put in running order and at work next week. The mill will be supplied from the mine upon which Fogus & Co. are working. The last crushing of 16 tons of

ore from this mine yielded \$190 per ton, and the bullion is worth \$6.50 per ounce.

Recent reports say that good placer diggings exist on Willow Creek. The diggings are said to be of a bench or bar character, and in many places prospect well 20 feet deep.

In speaking of the Oro Fino, Ada Elmore and North Star mining works, the editor says: There is about 2,000 feet of ground in that vicinity that shows the glittering ore along the whole line, wherever any work is being done. At each of the dump-piles abundance of the coveted stuff is visible in much of the ore. About 100 men are employed by the various companies, and that part of the mountain is one picture of industry.

The people are generally preparing for the winter.

The Iowa Co's mill, in Flint Dist., has commenced work. Everything works admirably.

World, Oct. 26th: The first clean-up of ore from the Pioneer ledge, worked at their mill, was highly satisfactory, and the working force has been considerably increased, and the mill is kept in constant operation, day and night.

Ellis, Devine & Co., who purchased the ditch property of William Lynch lately for \$20,000, are putting their lines of ditching in excellent order.

Another clean-up, after a three weeks' run, was made at the Elkhorn mill last Saturday, and the very handsome total of 680 ounces was the result, which yielded \$9,800 in bars. The Co. have paid up every dollar of indebtedness, and have over \$15,000 surplus funds on hands. The mill is kept constantly running, and the rock from the ledge is rich as ever.

Leviston Journal, Oct. 24th: The workmen on the Hie Jacet have already commenced the construction of the necessary buildings for the Hie Jacet mill. About 40 tons of ore are already extracted from the Hie Jacet vein, a part of which will be taken to the Williams & Maxwell mill for reduction, and the balance will be for the Hie Jacet mill. Work is being progressed in taking out more ore from this vein, and will continue through the winter.

All the tests made by the little mortar mill of Sanderson & Sherwin have fully sustained the hopes of the quartz men of the camp relative to the yield of the ore.

NEVADA.

Black Rock.

Sage Brush, Nov. 7th: Black Rock sends us but little information this week. The mill of A. Evans & Co. started on Monday. Isenheck superintends the entire working of the ore at this mill and will furnish the country with the result in a few days from this time. Some of the appliances for a new mill being built by the Atchison Bros. at Black Rock, were shipped from Susanville on last Tuesday. Atchison & Co. intend to put in operation a stamp mill of which the machinery that passed through here on the day mentioned above was a part. At what point it will be located we have not as yet been advised. We are as usual waiting for results and feel quite sanguine of the entire success of the present working.

Pahranaगत.

Reveille, Nov. 8th: The 10-stamp mill of the Pahranaगत M. & M. Co. is not yet finished on account of the delay in the arrival of the machinery. Pending the completion of the mill there is not much activity in mining operations in the district, although a few mines are worked steadily. The Indiana ledge, which belongs to the mill company looks exceedingly promising, and is producing a fair quantity of good ore. The Illinois is also worked by the same company, and continues to develop well. Another ledge, called the Webster, is producing an excellent quality of ore. Springer, one of the earliest settlers in Pahranaगत, is doing some work on several ledges for an eastern company. Hiko, the town and county seat, improved a little during the past summer, and will become a lively place as soon as the first mill works successfully. The present residents of the district have the fullest confidence that there are good mines there, in spite of the bungling management and waste of money which have been the characteristic features of some companies.

Reese River.

Reveille, Oct. 29th: The editor has been on a tramp among the mines of Belmont, in order, we suppose to prove for himself, on the principle that seeing is believing, that all the reports which he published of strikes, discoveries, big things, etc., are veritable facts. We give a synopsis of his report. First he visits the great Highbridge or Transylvania vein, also the Achilles, Quintera, El Dorado and many others. He says there appears to be considerable confusion and uncertainty, at least there is in

our mind, respecting the position and general character of these mines, and of none less than the Highbridge, but after a careful examination he came to the conclusion, by the aid of information imparted to him by the engineer in charge, that there was no doubt of there being three continuous and well defined veins. Upon the veins the principal companies operating are the Combination, Belmont, McAleer, and the Silver Bend companies. In all these, the vein is found quite regular and rich, bearing the same quality of ore throughout and everywhere continuous. The principal openings are those of the Belmont Co. Upon this quite extensive workings have been conducted.

The croppings of the Highbridge and Transylvania, on both the Combination and Belmont Co's property have been mined, or quarried out, to a depth of from 20 to 40 ft. and those of the latter company redned at their mill in Belmont. From the amount worked, some \$130,000 have been produced, although principally worked by wet crushing process, leaving a large percentage in the tailings, all of which have been carefully saved, and probably contain as much silver as the ore had already yielded.

The McAleer and Silver Bend Cos. were not at work at the time of the visit, and he did not visit the interior of the mines, but the ore on the dump and the regularity of the vein were sufficient evidence of their wealth.

Next came the works of the Combination Co. This mine, according to a New York pamphlet, "is the richest mine in the world," and "from the reflection of a candle the walls shone like ten thousand diamonds." Fearing to be struck blind by such a gorgeous and brilliant sight, our editor remained in the upper light, especially as he was refused admission to enter by one who "had been out all night," or nearly so. After examining the arrangements for the new mill, the editor, after promising us another report from these mines, returns, we suppose, to his editorial duties.

Nov. 5th: This morning, 2,100 ozs. of crude bullion from Coover's mill, at Bunker Hill Dist., were brought into the city for melting and assay.

Yesterday a bar of bullion, valued at \$1,500, was received in town from the Knickerbocker mill, near Ione.

The extraordinary quality of the ore which the Diana mine is producing excites general surprise, as it had not hitherto obtained distinction in that respect. We have before us the result of the working of two batches of its first class ore at the Metacom mill; the first lot of 3 1/2 tons yielded at the rate of \$842 per ton; the second lot of three tons, at the rate of \$814 per ton. Seven and a half tons of silver ore, producing \$5,579, could scarcely be met elsewhere than on Lander Hill. The second class ore, of which the Diana yields a large quantity, is also of superior quality, and will work upwards of \$200 per ton. It must be classed among the richest mines of the Reese River Dist.

Nov. 6th: Russell's stage, which arrived from Cortez last night, brought 1,400 ozs. of crude bullion from the St. Louis Co.

Last evening, three large bars of bullion, weighing 4,805 ozs., were brought into the city from the Knickerbocker mill, near Ione.

The mill and mine of the Mt. Tenabo Co. have been closed for the winter, by order of the Board of Engineers in San Francisco.

Nov. 8th: The South American mine, on Lander Hill, is literally improving daily. Good developments might properly be expected from its situation, lying as it does near to the mines of the Manhattan Co., to the Timoke, Savannah, and other valuable mines. At the depth of 150 ft. the vein is well developed in a drift, and varies in size from one foot to four feet, and the great mass of the ore produced will pay handsomely in the mill. This morning we learned the result of the reduction of 25 tons of the ore at the Metacom mill last week. Seventeen tons of the first class yielded at the rate of \$302 per ton, and eight tons of the second class at the rate of \$84 per ton. The Supt., T. W. Triplett, is satisfied he is handling one of the mines upon which the prosperity of the city will rely.

Nov. 9th: There arrived in the city on Saturday evening, by Russell's stage from Cortez, five bars of bullion from the Mount Tenabo Co., and 6,000 ozs. of crude bullion from the St. Louis Co.

Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

Virginia Enterprise, Nov. 5th: Last Saturday a melting was made at the Gould & Curry mill of sufficient crude bullion to produce 37 large bars. The bullion—valued at \$80,000—was brought to this city yesterday

by the Gould & Curry hullion wagon, and deposited at Wells, Fargo & Co's. The bullion was extracted from Gould & Curry and Savage ore.

Nov. 6th: No less than six of the most prominent mines in and about Como, Palmyra Dist., including the Wagram and Union, are being reopened and work in them prosecuted with great energy, some 40 men being employed. Ore selected from the old dump-piles, and hauled to Dayton, is yielding at the rate of over \$20 per ton.

Nov. 9th: The total amount of bullion shipped from this city and Gold Hill for the past week was 8,409 lbs, worth \$214,930.58; and the total amount assayed in the two towns was 97,973 ounces—a marked improvement over the previous week, both in the amount of bullion shipped and assayed.

Gold Hill News, Nov. 5th: We noticed a large-sized pile of bricks in Wells, Fargo & Co's office this morning. On inquiry, we ascertained that there were 23 in the pile—beautiful, bright bricks as were ever melted and assayed. Twelve belonged to the Kentucky Co., were worth \$25,000, and weighed 910 lbs; nine belonged to the Crown Point Co., were worth \$20,000, and weighed 670 lbs.; and two were from the Winters & Kustel mine, and were worth \$4,500, and weighed 170 lbs. In all, worth nearly \$50,000.

Nov. 7th: The Savage Mining Co. has declared a dividend of \$7.50 per sh. (\$150 per ft.), amounting in the aggregate to \$120,000, payable on and after Friday of this week. From the above disbursement the company carry over a surplus of \$60,000. The heaviest dividend of the year, on the Comstock, was declared yesterday in Gold Hill. The Eclipse Mill and Mining Co. declared a dividend of \$1,500 per sh.

Tresspass, Nov. 9th: This paper thus gives a description of the Hoosier State mill: The mill is run by a 14-inch cylinder engine of about 100-horse capacity, and it propels the large lot of machinery with great ease. The steam is supplied from two tubular boilers, one 44 inches in diameter and 15 ft. in length, the other 54 inches in diameter and 16 ft. in length. The superheated steam which is saved makes a great credit in favor of fuel used. Eighteen 700-pound stamps, in four batteries, crush daily about 40 tons of ore from the Chollar mine. Each stamp drops 9 ins. and 80 times a minute, yet with all this immediate weight the battery frames are not susceptible of a jar, so firm are the battery-blocks set in the earth. The ore, properly crushed, passes through transverso troughs directly to six 8-ft. settling vats, thence to eight of Greely's improved pans, where it is ground and amalgamated for five hours; then to four huge sheet-iron settlers just below, and then to three agitators, yet beneath, from whence the tailings run over 400 ft. of blankets to the cañon, where again they are corraled in a large reservoir, for use at some future day. At the south side of the mill are six Knox pans, which are in constant use working sulphurets and cleaning amalgam. One of the most noticeable improvements of the whole concern is the ease with which every portion of the gearing can be reached and repaired. One can walk erect among wheels and pulleys, and belts and shafts: so if anything gets out of order it may be reached without delay. Again, the water from the batteries is saved and used again. Signal bells from the batteries and amalgamating room connect with the engine room. So in case of accident the engine may at once be stopped.

UTAH.

Salt Lake Gazette, Nov. 2d: We are promised early next week, the sight of nearly 1,000 lbs. of silver, in bars, the same being the result of the first run of the Smelting Co. in Little Cottonwood Cañon during the present week. That amount was extracted entirely from the cinders made by Dr. Conger and others in their abortive attempts to manipulate the North Star lode. This result demonstrates that all that was wanted to prove the wealth of our mines in Utah was the employment of skilled labor in the treatment of the ores, men who have devoted the best portion of their lives in acquiring the necessary information to combat and overcome the difficulties incident to nearly every class of silver mining operations.

Reese River Reveille, Oct. 31st: There are several specimens of gold bearing quartz from Sweetwater at the notarial office of J. H. Schermer, which the curious may examine.

OREGON.

Dalles Mountaineer, Oct. 26: From Susanville, Grant county, we learn the following: The John Day Quartz Mining Co. will be ready to commence crushing quartz next week, and then we will be able to tell what our quartz is going to amount to. If it proves rich it will be a good thing for that camp, as there are ledges too numerous to

mention. Some of them prospect well with a hand mortar, but nothing short of a mill will test it well. The mill will be sufficient to give the quartz a fair test, as far as free gold is concerned.

Messrs. Cresap, Sawyer & Marshall are getting out quartz from the Marshall Ledge, for the mill to work as soon as it gets to running, which prospects very well. That is the only ledge being worked at present. There is some rock at the National ledge ready for the mill, which is said to be very rich, but the company have suspended work for the present.

## Notices to Correspondents.

**CHARLAMAGNE.**—The Darien Canal, which is again being brought into prominent notice, was originally suggested by the celebrated founder of the Saint Simonians, a sect which at one time occupied a large share of public attention in France. The suggestion for this canal may be traced as an emanation of our own revolution, as will appear by the following brief history. Henri de Saint Simon was born in 1760, being the lineal representative of the gossiping historian of Louis XIV. By an alliance with the ancient Counts of Vermandois, his family claimed to descend from Charlamagne, which fact primarily incited the ambition of Saint Simon. At seventeen he entered the army and served five campaigns during our revolutionary war. It was in this bellicose occupation that he conceived that the future of civilization lay in an era of peace and equality, sustained by the encouragement of scientific thought, and industrial activity. With these feelings his first occupation was the cutting of a canal through the Isthmus of Panama, the plans for which he laid before the Viceroy of Mexico; he soon found, however, that all his views, including this amongst the number, were too far in advance of his age. There exists but little doubt but the original design of the Suez canal, now under construction, emanated from the fertile brain of Saint Simon, as proof exists in abundance, that it was St. Simon's disciple, *Enfantin*, who communicated the idea to Lessep, the present concessionist.

**A WELL WISHER** is informed that there are mineral substances other than the flexible stone alluded to recently, which are more or less susceptible of flexure, the most remarkable and rare of which is flexible silver ore, or ferro sulphuret of silver. Mica and asbestos are the most generally known varieties; talc only is flexible, and not like the preceding, elastic also, as it does not when bent recover its original form on removing the force which compressed it; the other minerals described do. When the fibers of asbestos are so interlaced, in place of being parallel, as not to be apparent, it has been called mountain leather, and sometimes rock or mountain cork. The former occurs in flexible laminae or sheets, resembling leather, and the latter possesses the feel and somewhat the texture of cork. Both are so light as to float on the surface of water, in consequence of the loose interlacement of its fibers.

**YOUNG NATURALIST.**—Of the extinct birds during the historic period, the Moa (*Dinornis Giganteus*), of New Zealand, is one of the most remarkable. It exceeded the ostrich in size, being from ten to twelve feet in height. The tibia (drumstick) of this bird was from thirty to thirty-two inches in length, and the eggs so large that it is said that a man's hat would form only a sizeable egg-cup for one of them. These bones have been found in company with charred wood, evidencing that they were occasionally killed and eaten by the natives.

**N. G. H., Coulterville.**—The package of minerals, to which you refer us, has not yet come to hand. The matter of which you write is very interesting and important, and we shall give it full attention so soon as the package reaches us.

## Shall We have a State University?

This question, which has been so frequently and so earnestly asked in this State, appears now to be in a fair way to receive an early and practical answer. Some weeks since we mentioned the fact that the College of California offered to donate 150 acres of land, about five miles from Oakland, to the State for the use of the State Agricultural College. The Board of Managers of that Institution having visited the place, have unanimously voted to accept the offer; and thus it is settled that the Agricultural College is to be located there. The Trustees of the College of California further offer to donate the remainder of their land, 450 acres at the same place, to the State, on condition that the Legislature shall establish a first-class University there. The Constitution requires the establishment of a State University; we have a handsome University fund now in the treasury, and the present appears the proper time, and Oakland the proper place, to establish such an institution. A few objections have been raised, but their weakness shows the strength and importance of the proposition.

A cotemporary has remarked, "that it has been suggested that a University would absorb the Agricultural School." So far from this, it is the only plan known by which such a school can be kept alive. There is not to-day, in this country, a flourishing school of agriculture which is other than a department of some other institution on a broader foundation. The experiments which have been made in founding separate Agricultural Colleges in the United States, have, we believe without a single exception, been failures. The experiment made in the State of New York did not succeed, although it was backed by a handsome endowment and strong personal influence. The school has been merged into the Cornell University, where, surrounded by all the other departments of liberal learning, its existence and success are made certain.

The attempt to found a separate Agricultural School in Massachusetts has not been a success. The first President resigned. The second one, after a few months labor, retired, we judge, if not with disgust, with something of disappointment. The idea of total separation was practically ignored by locating the school within the shadow of Amherst College, where, in various ways, the support and advantages of that institution could be secured. At New Haven an Agricultural department has been grafted on to the renowned University, as well as a scientific school. The same is true with respect to several of the older colleges of New England and the few vigorous ones of the Western States. In this way the experiment has been successful, and in no other.

The fact is, we want a State University which shall embrace within its scope the entire of a Classical, an Agricultural, a Mining and a Mechanical school. We want such a University on a broad and liberal foundation, under the immediate patronage and charge of the State. Such an institution will draw around it the interest and support of nearly all the highly educated life of the State. We have the germ—already, in fact, a thrifty shoot—of such a concentration in the Associated Alumni of this coast, which now holds its annual gatherings in Oakland, on thosame day on which occurs the commencement of the College of California. This association will throw its active influence in the support of a State institution, such as we have shadowed forth. It is already a power which is being felt in the literary circles of the State—purely intellectual and cosmopolitan in character, and eminently safe to be the nursing mother of the coming University, which we have faith to believe is about to be inaugurated within the already classic confines of our neighboring suburb.

**GAS.**—The gas company has reduced the price of gas about eight per cent.; this favor would be thankfully acknowledged if it was not coupled with a deterioration of fully twenty per cent. in quality.

## The Recent Meteoric Display.

The predictions of astronomers in regard to the periodic nature of the great "meteoric showers," as they are called, seems now to be quite fully established. There is evidently a point in the heavens, reached by our earth and a large body of meteorites, in periods of from thirty-three to thirty-four years.

Various theories have been proposed to account for the phenomena of meteorites; but that of Chaldani is the only one that has met with any considerable favor. It consists in supposing that, independently of the great planets, there exist in the planetary regions myriads of small bodies, which circulate about the sun, generally in groups or zones; and that some of these zones intersect the ecliptic, and are consequently encountered by the earth in its annual revolutions. There are, indeed, many objections to this theory, and many facts in regard to meteoric appearances which it is difficult to account for on this hypothesis; but it must be recollected that as yet we have collected but very little knowledge with regard to the nature of such bodies. Certain it is that they appear at great altitudes above the earth, move with immense velocity, and present phenomena which are quite as difficult to be accounted for on the only other admissible hypothesis, that they owe their origin to the disengagement of electricity, or some analagous matter, which takes place in the celestial regions, on every occasion on which the conditions recur for the production of the phenomena are renewed.

The display on Thursday night last, the 14th instant, was almost identical in character, and, had it not been for the presence of a full moon, would undoubtedly have been quite as brilliant as that of 1833.

The height of the display was between the hours of 12 and 1 o'clock. The air was highly charged with electricity at the time, and the meteors, such as were visible, appeared at the rate of about fifty per minute, according to the observations of Dr. Harkness in Sacramento. According to that gentleman's observations, they appeared to start from a point about five degrees south-east of the zenith, as their center of appearance—precisely the same noticed by him as the central point of their appearance in 1833. Their general direction was westerly, in a nearly horizontal direction. Their next appearance may be looked for in 1901.

**THE ENSLEY GAS.**—The Pacific Knitting Mills at the Mission, are lighted with the Ensley gas, which is made at that establishment,—from wood and the wool refuse of the works. This gas gives a fine, white light, and is produced much cheaper than gas can be made from coal, where a supply of animal refuse can be obtained at a reasonable low price. The Pacific mills are now running to their fullest capacity, and are turning out large quantities of goods, equal in their kind to any which can be imported. This is a most important enterprise and one well worthy of encouragement. Everybody who buys knit goods, should inquire for those of California make. That is the way to build up our home manufactures, and create a demand for the labor of our own people.

**INDELIBLE PENCILS.**—Traver Bros., at No. 32 Merchants' Exchange, are agents for a patent indelible pencil for marking linen and other kinds of white goods. The pencil is one of the handiest and most useful little affairs we have seen for some time. It does away entirely with the indelible ink, which requires a pen to do the marking, and any one who has tried that mode of marking linen, will readily appreciate the indelible pencil, besides it will save ten times its value in one year, in keeping track of the various articles of apparel, generally lost or exchanged by various means. It is said to be an improvement on all former indelible pencils.

## PROBABLE CHANGE OF METHOD IN THE

## REDUCTION OF GOLD AND SILVER ORES.

Several weeks ago we briefly alluded to the necessity which existed for some beneficial alteration in the mode of obtaining the precious metals from their accompanying gangue, if our mines are to return to their stockholders a fair remuneration for the capital and risk incurred. At that time we vaguely hinted at the possibility of an early approach to a more desirable state of things, an opinion, however, that was based more upon rumor than facts positively known to us. In the same article we made the statement that a gentleman who, we may here state, has been long known to us, whose name, when made public, will doubtless be also either personally or by reputation very familiar to most of our readers, had repeatedly stated that the loss now sustained, of fifty-five per cent. on the yield of bullion, was preventable to the extent of fifty per cent. This announcement led to some correspondence, through us, with parties interested in improving the present system of work, but, thus far, without any practical result.

In consequence, however, of some matters connected with the negotiations above alluded to coming to the notice of certain shrewd, practical business commercial men, whose status in the general welfare and progress of California, both individually and collectively, is of the most extensive character, the subject which forms the caption of this paragraph is now under serious advisement, with the object of ascertaining the feasibility of carrying into execution some practical plan. In another week or so we hope to be able to state what progress has been made in this connection.

## PROF. LAYRES' ELEMENTS OF COMPOSITION.

We notice that at the meeting of the Board of Education, on Tuesday evening last, on recommendation of the Committee on Text-books, the Secretary of the Board was directed to address a note to each Grammar and High School teacher, requesting them to adopt Prof. Layres' new work, "Elements of Composition and Belles Lettres" in their schools. This movement is a most proper one. The work alluded to has been pronounced by all, without exception, who have examined it, as the best work of the kind extant. It is, moreover, a California book, written and printed in this State, and as such, all other things being equal, has an especial claim upon the attention of our teachers and School Superintendents. We would call the especial attention of all interested in education, throughout the State, to the above action of the San Francisco Board of Education. Specimen copies of the work can be obtained at this office.

**THE IRON AGE,** the exponent of the iron interest in the Atlantic States, entered upon its 4th volume on the 26th of September last. Its publisher took occasion on that event to enlarge the paper to double its former dimensions. This is an ably conducted and most valuable journal. It is read largely, enjoys the confidence and approval of most of our eminent statesmen, and is named as authority on all questions connected with the iron and hardware interests of this country. We esteem it as one of the most valuable of our exchanges. It is conducted by John Williams, 80 Beekman street, New York.

**FIRTH & SON'S STEEL.**—The agents of this celebrated firm, Nelson & Doble, 819 and 321 Pine street, received per ship Hertfordshire, a few days since, their first invoice of Firth & Son's celebrated boiler steel, made especially for the manufacture of steel boilers, and generally acknowledged to be the best steel for that purpose. We propose to make especial allusion to this steel in our next issue.

**ANOTHER TERRIBLE MINE EXPLOSION** is reported by telegraph to have occurred at the Forindale Colliery, near Glamorgan; 300 miners were at work, of whom 200 are reported as being killed.

(Written for the Mining and Scientific Press.)

The Freiberg, or Barrel Process, for the Reduction of Gold and Silver Ores.

BY PROF. ROWLANDSON, F. G. S. L.

Messrs. Editors:—Two recent occurrences have combined to again introduce into more prominent public attention the subject which forms the caption to this article, as compared with the dormant state into which it has for some time fallen. I allude to the statement made in Prof. Blaké's correspondence from Freiberg, "that the barrel method had become quite abandoned at Freiberg." This fact has been well known to the writer for a considerable time, as well as to a few others, whose habit is to ascertain what is going forward in connection with their profession at other places outside of their individual locality. With the general public, however, the information so conveyed through the medium of the MINING AND SCIENTIFIC PRESS, the news appears to have come, to use a vulgar expression, like an unexpected thunderclap; so much so that by way of illustration I may state, that after the hearing of the argument recently held in the U. S. Circuit Court, on the motion for a new trial in the case of Brodie et al. vs. the Ophir S. M. Co., an irregular but interesting conversation occurred, in which the bar and the court participated, respecting the probable future employment or abandonment of the barrel method of reducing gold and silver ores. Such an occurrence, while it prominently displays the lively and deep interest felt by every section of the public on all matters tending to improve or economize the extraction of hulsion from its ores, at the same time illustrates the very superficial and limited amount of the reasoning faculties which has hitherto been brought to bear on the subject by the public generally; so little, in fact, that its conduct since the Washoe discoveries, has been characterized by the total absence of the mental qualities, best calculated to produce permanently beneficial results. Instances will hereafter be introduced to illustrate this strange mental hallucination on the part of the many, but not wise-headed public. This deficiency of logical powers on its part, will be shown in the course of the ensuing remarks respecting the Freiberg barrel.

In the first place, it may be stated that, at the commencement of the Washoe discoveries, or say nearly eight years ago, I wrote a series of articles which appeared in the Evening Bulletin, giving an abstract of the geological accompaniments ordinarily associated with metallic mineral veins; more particularly gold and silver ores, the latter having for many years prior to my arrival in California, occupied no small portion of my time, means and attention. In addition to the preceding, I dwelt very largely on the different modes adopted, under varied circumstances and place, with the intent of beneficiating auriferous and argentiferous ores. This latter named portion of the series was copious, and I am not aware that anything material relating to the reduction of these metals from their ores was omitted; it was brought up to all the facts then known to science, and I have yet to learn of any material fact that has since been discovered in relation thereto by science, or changed manipulation possessing novelty, combined with economic advantage.

Those parts of the series above mentioned were probably of too didactic a character to please many, especially those who esteem expertness at note-shaving and jacket swapping, as the two highest and most estimable faculties pertaining to human wisdom, and the only essentials to the perfectly practical man of business, as such usually, when possessed of a few dollars, in their vanity customarily esteem and describe themselves to be. Yet such, from the time alluded to up to the present period, have more or less been the victims and patronizers, sometimes of self deluded enthusiasts, at others, of downright charlatans and humbugs, the whole of which would form a long series, commencing with McCulloch's "bricks," and probably will not terminate with Eisenbeck's "twenty cent chemical nostrums," (which now forms the Black Rock and Gold Hill excitement), unless those interested in silver mining operations very much change their course of proceeding, and engage the services of parties both theoretically and practically acquainted with mining and the reduction of ores, and so avoid the enormous losses, amounting to full fifteen million dollars per annum now sustained, owing

to the employment of irrational methods—the result of ignorance, not of wilfulness. It was my intention in this place to have made some personal allusions, merely, however, relating to the writer; but they will be deferred until the conclusion of the series, in order to at once enter into the investigation.

WHETHER THE BARREL OR OTHER METHODS IS BEST ADAPTED TO THE CIRCUMSTANCES OF THE PACIFIC STATES, FOR THE REDUCTION OF SILVER ORES.

We see few things more common, even among educated people, than that of erroneous ideas arising in their minds in consequence of illogically associating the complex with the simple. Thus, when a barrel or the barrel process is alluded to by or before one unacquainted with the possible variations which may occur to change the character of the ore, or the propriety of the adoption of the other, he is very apt to conclude, from what by logicians is termed simple apprehension, to mentally embody the conception that like results, whether beneficial or detrimental, must occur wherever the same article or method may be employed, not heeding the numerous complex circumstances which may occur to completely render the comparison valueless.

This remark particularly applies to the subject under consideration. As, however, very few are aware of the conditions under which the barrel process was formerly employed at Freiberg, and subsequently discontinued, a brief recapitulation will probably be deemed of general interest. Before doing so, however, I wish to make one observation. Prof. Blaké, in his interesting letter from Freiberg, stated that the barrel process was abandoned, and fire now only was used; neglecting, I presume, in the hurry of traveling, to mention that "the fire" was used only in the first instance in the concentration of the ore into a matte, containing 60 to 65 per cent. of metallic copper, the particulars of which will hereafter be given. The separation of the silver contained in this concentrated matte, obtained by means of fire, has again to be subjected to the same ordeal in the roasting furnace, after which the silver has to be extracted by the humid or aqueous method in the mode patented some years ago in the United States by Huttmeister Ziervogel, when a resident of this country, and engaged in the coal mines of Pennsylvania. All these matters will, however, be explained in the course of this series.

Finding the space rapidly filling which it is customary for newspaper publishers to ordinarily give to any single subject in one publication, I shall have to defer to another week the description of the various modes that have been heretofore, and such as still are employed, as well as explanations comparative of the advantages of each. I shall therefore, this week, make a brief summary of those points connected with the barrel process which it appears to me has chiefly tended to retard its general introduction.

In the first place, no means have hitherto been devised of practically chloridizing silver ores, excepting at a loss of fifteen per cent. of the precious metal—gold not so great, unless copper is also present, in which case the loss of gold is even greater than what occurs with silver. In Germany one half of the loss sustained by chloridizing has been saved hitherto by periodically sweeping the flues and chimneys, which are constructed in such a manner as to have special reference to the subsequent condensation and extraction of the precious metals so sublimed; but on the Pacific coast no such costly constructions are formed for the purpose of effecting this saving, consequently all the precious metal which becomes sublimed is lost to the operator. Owing to the high price of labor and other circumstances connected with the Pacific coast, it is by no means probable that within any reasonable period such expensive condensing appliances will be constructed. It therefore becomes important to consider whether any less costly mode of procedure to obtain the same object could be adopted. This I fully believe may be done, chiefly by employing a different mode of chloridizing in such a manner as to obtain perfect chlorination, without being accompanied by any loss of the precious metals, combining at the same time some additional improvements in the barrel and the admixture of the pulp, by which means the lining of the barrels, in place of lasting only from twelve to sixteen months, as shown by Mr. Brodie, in his evidence on the recent trial, such lining might be made to endure certainly double, perhaps treble the time named by him. As the changes here alluded to could be effected at a comparatively small outlay, and would probably not cost more than one dollar per ton more than the ordinary mode of amalgamating by means of pans, the saving would be enormous.

In fact the difference in the cost for wear only between the pan and barrel, under the circumstances, would about suffice to pay the additional one dollar per ton cost by operating with the latter in place of the former. The outlay in the cost of constructing and erecting these different machines would also be a considerable item. It would probably, therefore, be quite safe to say that on the completion of such a state of things as enumerated above, a saving could be accomplished of 30 per cent. out of the 35 per cent. on the fire assay,\* now being lost on Washoe ores, under the ordinary mode of operating; this, with an ore that assayed fifty dollars per ton, would amount to fifteen dollars per ton, or equivalent to the entire sum charged for treating ores at the custom mills; or, to make the remark more pointed by giving a special illustration, it may be mentioned that according to the Stock Circular, the Savage mine raised during the fortnight terminating on the 26th October last, 3,865 tons of ore, on which, at the customarily estimated loss of thirty-five per cent. on the fire assay, could not amount to less, in round numbers, than the gross sum of \$75,000, or at least \$150,000 per month; a nice sum to add to the monthly dividends; more, I anticipate, than will find its way to the stockholders' pockets under existing circumstances. I shall briefly conclude for the present week, by observing that the fact of gold existing in combination with Washoe silver ores, would, I believe, alone make Ziervogel's method inapplicable for the class of ores found at Washoe, except the gold is to be subsequently obtained by a second operation, which, with many, would be an objection. I have alluded to Ziervogel's method, more particularly, because it is the one which has superseded most of the other methods in Saxony, and some adjoining States.

\* Thirty-five per cent. on the fire assay, is equivalent to 55 per cent. on the bullion produced.

Perry Davis' Vegetable Pain Killer.

The Pain Killer, so justly celebrated, was introduced to the public many years ago, and now enjoys a popularity unequalled by any other medicine. For the cure of diphtheria, dysentery, cholera morbus, rheumatism, coughs and colds, scalds, burns, etc., it is without an equal. Sold by all the principal druggists.—Cleveland (Ohio) Plaindealer.

PERRY DAVIS' VEGETABLE PAIN KILLER possesses virtues which not alone removes pain instantly, but regulates the stomach, gives strength, tone and vigor to the system. It is one of those medicines which is worth more than gold.

Prices, 25 cents, 50 cents, and \$1 per bottle. Sold by all Druggists, Grocers and Medicine Dealers everywhere. nov1n

CANALS.—The farmers residing north of the Calaveras river, between Cherokee lane and the Woodbridge road, says the Stockton Independent, have expended a considerable amount of labor in constructing canals, which answer the double purpose of carrying off the water in winter, and irrigating the land in summer.

THE next great gold field of the West is believed to be the neighborhood of the Black Hills of Dakota, and known from actual demonstration, to possess the precious metals in great profusion.

NEW COUNTERFEIT.—A new counterfeit half dollar, purporting to be an issue from the mint of 1867, has made its appearance. It is slightly lighter than the genuine, and is a base metal plated.

GOLD IN SITKA.—Gold is reported as having been discovered back of Sitka. If such is the fact, the exploring expedition will soon communicate the fact in a reliable shape.

THE monster gun known during the siege of Charleston as the "Swamp Angel," and which sent its ponderous messages into the doomed city from a point seven miles away, is now lying in front of the Trenton (N. J.) American office.

HEAVY JOB.—A wood-chopper named Thomas Smith, living near Grass Valley, will wager \$200 that he can cut, split, and pile-up six cords of wood in twelve hours—the banter to remain open for two months.

TOWNE & BACON, Book and Job Printers, Have the Largest Office, Do the most work, And do it better Than other offices In this City, 536 Try them With a Job, And you will be Satisfied the above Statements are facts. Their office is at 536 Clay St., below Montgom'y, Over Pacific Fruit Market.

CALIFORNIA TOOL AND FILE FACTORY. Blacksmith and Machine Shop. No. 17 Fremont street, between Market and Mission, S. F. Job Grinding and Polishing done at shortest notice.

The attention of the parties engaged in shipping or inland navigation is called to the Superior Workmanship of Mr. LOCHHEAD, who has been in the business in San Francisco for the last fourteen years, and enjoys the reputation of having built ONE HUNDRED AND SEVENTEEN STEAM ENGINES.

**DISCOVERY OF SALTPETER.**—The Oakland Journal is informed that a party camping out on one of the hills in Murray township, lately, discovered a bed of saltpeter. A camp fire had been built, and some of the mineral near the surface of the ground took fire. If, on further exploration, it should be found that an extensive bed of saltpeter actually does exist there, a want so long felt in this State will be supplied, for we believe that all that has thus far been used has been imported.

A curious meteorological phenomenon was recently observed in Georgia. It is reported that a heavy cloud passed over Macon, in an otherwise clear sky, at such a rate that from its first appearance on the Eastern horizon to its disappearance in the northwest was not more than three minutes. It was densely black, except all the edges, which were lighted by the moon.

At the Hot Spring smelting furnaces, Mono county, they are using a very superior soapstone lining, which stands the heat far better than the English brick. It is taken from a ledge near Sonora, Tuolumne county, owned principally by Jack and Fred. Faxon.

**FIRST**  
**Paint Manufactory**  
IN CALIFORNIA.

**EPES & E. H. R. ELLERY**

Have the Patent Right for the Pacific Coast to manufacture, sell and use

**Ellery's Patent India Rubber Cement & Paint.**  
It is for all exposed surfaces; impervious to wet; will not rot, peel, blister or crack, in any climate. A superior Paint for brick, wood, cloth, metals, etc.; successfully used in the Eastern States. The old tin roof of that large building, the New York Rice Mills, was in such bad condition it was about to be taken off ten years since. Instead, they put on the INDIA RUBBER CEMENT AND PAINT, making a good tight roof every of India Rubber Paint every two years since keeps it in good condition. We can refer to many others. The Atlantic Lead Works use our Paint only. **NEW CLOTH ROOFS** put on copings and all seems cemented and saturated, then coated with the India Rubber Cement and Paint—the same as on the St. Nicholas Hotel at New York City, the City Buildings and many others, the roofs of all the horse and steam cars, decks of steamboats, etc., around New York—for eight dollars per one hundred square feet. **NEW OR OLD TIN ROOFS** cemented and painted with the India Rubber Cement and Paint guaranteed, at from one cent to two and a half cents per square foot, according to size and condition of roof. Good men and the best materials used.

We have just completed and painted all tin roofs of Dr. H. D. Cogswell, Thibbs & Co., D. J. Oliver, etc., and in wood work of Sheriff Davis' building, 88 feet front, on Folsom street, between Third and Fourth streets—only one coat. The work will speak for itself. Now painting the cornice and iron work of Dr. H. D. Cogswell's building, corner of Front and Clark streets—one coat. See the above and further references at our office.

**ELLERY'S PATENT INDIA RUBBER CEMENT AND PAINT** is composed of India rubber and other gums, dissolved in linseed oil, mixed with the various coloring matters and ground in any color. When applied to roofs or other purposes, it is mixed with pure linseed oil to the required thickness, and put on as other paints are with a paint brush—retaining sufficient elasticity to give and take with the heat and cold. Placed on hundred fishing vessels at Cape Ann use the India Rubber Paint, finding it superior to all others.

**EPES & E. H. R. ELLERY** are now prepared to make good roofs, and cement and paint new or old ones, and do all kinds of outside painting with Ellery's Patent India Rubber Paint. No asphaltum or coal tar used. Office, No. 226 Jackson street, corner Battery, San Francisco, Cal. 6v15

THE PHILOSOPHY OF MARRIAGE, BEING FOUR IMPORTANT Lectures on the FUNCTIONS and DISORDERS of the Nervous System and Reproductive Organs, to be had by addressing and enclosing twenty-five cents, postage stamps to Secretary PACIFIC MUSEUM OF ANATOMY, Montgomery street, San Francisco. 12v15-1y

Important to Californians.—Many Inventors have ately had their claims for Patents seriously (and in some cases fatally) delayed by the unaffiliation of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations. These discrepancies, although arising from the inexperience of honest agents, are none the less dangerous to applicants for patents, whose safest course is to trust their business with none but active and experienced solicitors. The Mining and Scientific Press Patent Agency has strictly complied with the requisitions of the Department, and properly filed all necessary papers as Claim Agents.

R. N. VAN BRUNT, Secretary. Office, 331 Montgomery street, San Francisco. no5

Mount Tenabo Silver Mining Company, Cortez District, Lander County, Nevada.

Notice is hereby given, that the Annual Meeting of the Stockholders of the above named Company will be held on THURSDAY, the twenty-eighth day of November, 1867, at 1 o'clock A. M., at the office of the Company, No. 331 Montgomery street, San Francisco, for the election of Trustees to serve the ensuing year, and for the transaction of any other business.

R. N. VAN BRUNT, Secretary. Office, No. 331 Montgomery street, San Francisco. no9

North Star Gold and Silver Mining Company, Reese River Mining District, Lander County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 19th day of September, 1867, an assessment of twenty dollars per share was levied upon the capital stock of said Company, payable immediately, to the Secretary, George H. Faulkner, No. 423 Front street, San Francisco.

Any stock upon which said assessment shall remain unpaid on Tuesday, the twenty-second day of October, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the eleventh day of November, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

GEORGE H. FAULKNER, Secretary. Office, 423 Front street, San Francisco, Cal. oc21

POSTPONEMENT.—The day for deeming stock delinquent on the above assessment is hereby postponed until Wednesday, the 20th day of November, 1867, and the sale thereof until Saturday, the 7th day of December, 1867. By order of the Board of Trustees.

GEORGE H. FAULKNER, Secretary. Office, 423 Front street, San Francisco, Cal. oc21

OLNEY & Co., Auctioneers and Real Estate Agents, attend promptly to all business entrusted to their care in San Francisco and Oakland. Mining and other corporations will find Col. Olney well posted and thorough in transacting sales of delinquent stock. Office, on Broadway, Oakland, and No. 318 Montgomery street, San Francisco. nols

Illegal Supplemental Advertising.—It would be well for Mining Companies, whose advertisements are repeatedly appearing in the Supplements of daily papers, to inquire into the legality of that class of advertising.

Nuestra Senora de Guadalupe Silver Mining Company. Location of Works: Tayolita, San Dimas District, Durango, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-first day of October, 1867, an assessment (No. 29) of one dollar (\$1) per share was levied upon the assessable capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, E. J. Pfeiffer, at the office, No. 210 Post street, or to the Treasurer, A. Hunsicker, at his office, No. 637 Washington street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the thirtieth day of November, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-third day of December, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

E. J. PFEIFFER, Secretary. Office, No. 210 Post street, San Francisco, Cal. oc25

Quail Hill Mining and Water Company.—Location of Works: Quail Hill, Calaveras County, Cal.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the eighteenth day of September, 1867, the several amounts set opposite the names of the respective shareholders, as follows:

Table with columns: Names, No. Certificate, No. Shares, Amount. Includes names like W James, O W Borer, etc.

And in accordance with law, and an order of the Board of Trustees, made on the eighteenth day of September, 1867, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by Messrs. Duncan & Co., auctioneers, at the office of the Company, room No. 10, second floor of No. 402 Montgomery street, San Francisco, on Monday, the eleventh day of November, 1867, at the hour of 2 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

T. W. COLBURN, Secretary. Office, room No. 10 second floor of No. 402 Montgomery street, San Francisco. nols

POSTPONEMENT.—By order of the Board of Trustees of the Quail Hill Mining and Water Company, this day made, the above sale is postponed until Monday, the twenty-fifth day of November, 1867, at the same hour and place.

T. W. COLBURN, Secretary. San Francisco, Nov. 9, 1867. nols

Rattlesnake Gold and Silver Mining Company, Brown's Valley, Yuba County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the seventeenth day of October, 1867, an assessment of one dollar (\$1) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at 318 California street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the twenty-first day of November, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the ninth day of December, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

JOHN F. LOISE, Secretary. Office, 318 California street, San Francisco, Cal. oc19

Sophia Consolidated Gold and Silver Mining Company, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the seventh day of November, 1867, an assessment of fifty cents per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, at No. 611 Washington street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the seventh day of December, 1867, shall be deemed delinquent, and unless payment shall be made before, will be sold on Monday, the twenty-third day of December, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

DAVID E. JOSEPH, Secretary. Office, 611 Washington street, San Francisco. no9

Whitman Gold and Silver Mining Company.—Location of Works: Indian Springs district, Lyon County, Nevada.

Notice is hereby given, that the following named shares in the capital stock of the Whitman Gold and Silver Mining Company, designated by the number of Certificate of each parcel of said stock, were sold, as by law provided, at public auction, on the twenty-eighth day of October, 1867, for delinquent assessments thereon, and will not be transferred by said Company:

Table with columns: No. Cert., No. shs., No. Cert., No. shs., No. Cert., No. shs. Includes numbers like 143, 144, 145, etc.

T. W. COLBURN, Secretary. Whitman Co. & S. M. Co. San Francisco, Oct. 31, 1867. no3-w

Whitman Gold and Silver Mining Company. Location of Works: Indian Springs District, Lyon County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the thirty-first day of October, 1867, an assessment of one dollar and fifty cents per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, at his office, (room No. 10, 2d floor) No. 402 Montgomery street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the second day of December, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-third day of December, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

T. W. COLBURN, Secretary. Office, room No. 10, 2d floor, No. 402 Montgomery street, San Francisco, Cal. no2

Machinery.

VARNEY'S PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setters made on the same principle excel all others.—They bring the pulps constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setters for themselves, at the PACIFIC FOUNDRY, San Francisco.

Hunt's Double-Action Pump

Is clean, durable, strong, and not liable to get out of order. Built and on hand at No. 23 Second street, and 108 Jessie street. 14151st E. O. HUNT, Prop'r.

PATTINSON'S

HURDY-GURDY WATER-WHEEL.

The inventor of this Wheel having, after much delay, finally obtained the patent for the same, is prepared to sell rights therefor to such as may be desirous of putting them up, or continuing those already in use. This is well known among miners as the "hardy-gurdy wheel," and is considered the most economical Water-Wheel now in use.

Notice is hereby given, that the subscriber is the inventor and holds the patent right for the construction and use of the same; and that no person has a right to manufacture or use them without his permit. 7145-47 THOMAS PATTINSON.

Brodie's Patented Improvements

FOR THE TREATMENT OF

Gold and Silver Ores.

BRODIE'S PATENT IMPROVED QUARTZ CRUSHER. The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, singularly of action and lightness of construction, so that it is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms: No. 1.—Or 15 inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price, \$600

No. 2.—Or 15 inch Crusher, capable of similarly putting through five to six tons per hour, \$500
No. 3.—Or 18 inch Crusher, will in a similar manner crush from seven to eight tons per hour, \$1,200

The frame is made of cast iron, bound with heavy wrought iron bands, making it very strong, and at the same time light and portable. The crusher is bolted to a wood frame of sufficient light to clear the fly-wheel, and allow the crushed quartz to pass off. The dotted lines show the movable and stationary jaws. Letter A represents the eccentric shaft by which the power is applied direct to the movable jaw. B represents the movable jaw, and C the fixed jaw. D represents the link or radius bar. E represents the bolts for regulating the opening. F, which can be regulated at pleasure, so as to graduate to the size to which it is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designated.

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, D, gives the movable jaw, B, a forward and downward motion at the same time, and which makes the hardest rock yield and separate into fragments of any desired size.

The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Rawhide Ranch, Tuolumne county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Fulton Foundry, First street, San Francisco.

The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Rawhide Ranch" Mine, in Tuolumne County: RAWHIDE RANCH, Tuolumne Co., Sept. 23, 1866.

JAMES BRODIE, Esq., San Francisco.—My Dear Sir: It gives me pleasure to inform you that I have for the past three months had one of your largest sized Rock Crushers in use, at the Rawhide Ranch Mining Company's Mill, which has entirely met my expectations; and I have no hesitation in recommending it to all who are in need of a machine for rapidly, cheaply and properly preparing quartz for the stamps. Yours truly, R. P. JOHNSON, Supt. Rawhide Ranch Quartz Mill.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.

For the present it is not intended to grant licenses for the use of the Improved German Barrel, for a longer term than twelve months. All persons desirous of procuring, without having recourse to legal proceedings, for past infringements, or of being of receiving Letters of License for the limited period named, are requested to address as below. A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 20th, 1866.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—This Dry Crusher has been found the most economical and effective mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1866. JAMES BRODIE, Fulton Foundry, or CHARLES RADCLIFFE, Express Building, 402 Montgomery street, San Francisco. 12151st

Quartz Mill Construction and Superintendence

THE UNDERSIGNED IS AT PRESENT OPEN FOR AN engagement as a working Superintendent in the construction or operation of a Quartz Mill. Has had five years steady and successful experience in working ores in Washoe, and is practiced in saving sulphurets and the treatment of rebellious ores. Is prepared to furnish references for all the necessary qualifications of an intelligent, faithful and reliable quartz operator. Address P. M. SHAW, San Francisco, care Mining and Scientific Press. 251143m

THE CELEBRATED Self Generating Portable Gas Lamp.

This extraordinary Lamp produces its own gas by the vaporization of Petroleum, Naphtha, or Benzine. It emits neither smoke nor smell, and burns with a pure white flame, and is so tenacious to an ordinary gas burner, and at an expense of from one to three cents per hour only, according to the quantity of light required. It is peculiarly adapted for dining purposes, also for stores, factories, billiard rooms, and in all cases where a portable lamp is required, and for which it is an admirable substitute. As an outdoor light it stands unrivaled, burning with undiminished brilliancy in a strong wind.

Directions for Use.

Charge the reservoir with the prepared fluid, or with Benzine, from half to three-fourths full; allow a portion to run through into the cup, then turn off the tap and ignite the fluid, which will heat the burner sufficiently to generate the gas, which will be seen issuing from the top. This tap may now be turned on, and a steady light will be maintained till the whole of the contents of the reservoir is consumed.

A small needle, bent at the point and fixed in a holder, may be occasionally required to clear the minute hole through which the gas issues, and the remaining screw at the bottom turned a little back; but care must be taken not to force the screw too high, and it should never be used to extinguish the light—by turning the tap off, it will gradually go out.

When necessary to renew the cotton which is placed in the lower pipe to prevent the too rapid flow of the fluid, the lamp should be placed in a vise and the burner screwed off the burner cap, and then be removed suitably to a fresh piece of stout cotton rag, one inch wide and four or five inches long, should be doubled over a piece of wire, and inserted into the pipe—the ends cut short off, the burner again screwed on with a little white lead, and the lamp is ready for use.

Manufactured solely by JOHN J. HUCKES, original proprietor, Factory, North Beach, San Francisco; and for sale by his agents in every city throughout the State. 1814-3m-8

E. O. HUNT,

Manufacturer of

Windmills, Horse-Powers, Pumps, Pumping Frames and Gearing.

HUNT'S ADJUSTABLE WIND MILLS to lift all the sails so arranged as to turn edgewise to the wind when the mill is stopped. The sails can be set at any angle to suit the force of the wind, while the mill is running, by means of the brake lever at the foot of the mill, by any person.

HUNT'S SELF REGULATING MILL is strong, durable and cheap. It is provided with means for stopping, in the most violent winds. The mill is well known throughout the State.

Tread Horse-Powers, Swap Horse-Powers, Pumps in great variety, Single and Double-Acting, Frames and Gearing for running pumps, from steam or other power, constantly on hand and for order. Water wheels built to order. No. 23 Second St., and 105 and 110 Jessie St. 2151st San Francisco.

SUPERIOR CUT-OFF ENGINES.

We desire to call the attention of Engineers, Manufacturers, and Millmen, to the celebrated

Hartford Engine,

With Wright's Patent Variable Cut-off, which are now manufacturing under a license from the Woodruff & Beach Iron Work Co., Hartford, Ct. To parties wishing a First class

Fuel-Saving Engine,

Simple and durable in construction, this Engine is offered in the belief that it is superior to any other manufactured. It enjoys the very highest reputation in the Atlantic States, where it is well known; over 300 of them having been built by the Woodruff & Beach Company, and being now in successful operation.

GODDARD & CO.,

Pacific Iron Works, 9151st San Francisco, Aug. 29, 1867.

DR. BEERS' PATENT WIRE GAUZE AMALGAMATOR.

THE ATTENTION OF QUARTZ, HYDRAULIC AND Pincer Miners, is called to this new invention for saving Fine Gold. It is designed to furnish the miner with a cheap and simple apparatus by which the finest freegold can be saved without loss, requiring little attention, no machinery to drive it, and will positively collect every particle of amalgam, or of waste mercury that may have escaped from mill or sluice, and as these particles are always charged with more or less gold, this item alone, in many instances, will more than pay the cost of this Amalgamator every month. For Circulars, and further particulars, address Da J. B. BEERS, San Francisco, Per Wells, Fargo & Co's Express. 1115 6m

TO SPORTSMEN.

THE UNDERSIGNED, HAVING BEEN APPOINTED Sole Agent for the Pacific Coast for the sale of RUPPEL'S REPEL-LOADING SHOT GUN, which discharges four shots in two seconds, circulars will be furnished by applying to or addressing HENRY BTEL, 111 Second street, Or Lock Box 1172 P. O., San Francisco. 1815 21m6m

Engraved to Order.—Persons who desire to illustrate their individual establishments or business, should give us their orders for Engraving and Printing, and we will guarantee good work and reasonable prices. DEWEY & CO., Patent Agents, Publishers and Job Printers, 505 Clay st.

TRAVELING STONES.—They have "walking leaves" in Australia, and, as we are now informed, they have "traveling stones" in Nevada. Mr. Hart, from Pahraugat, Nevada, has shown the editor of the Territorial Enterprise several curious pebbles—not curious in appearance, but rather curious in action. They were almost perfectly round, the majority of them nearly as large as a walnut; and of an iron nature. When distributed about upon a floor, table or other level surface, within two or three feet of each other, they immediately began traveling toward a common center and there huddled up in a bunch like a lot of eggs in a nest. A single stone, removed to the distance of three and a half feet, upon being released at once started off with wonderful and somewhat comical celerity to rejoin its fellows; taken away four or five feet it remained motionless. Mr. Hart says they are found in a region of country that, although comparatively level, is nothing but bare rock. Scattered over this barren region are little basins, from a few feet to a rod or two in diameter, and it is in the bottom of these that the rolling stones are found. They are from the size of a pea to five and six inches in diameter. The cause of these stone rolling together is doubtless to be found in the material of which they are composed, which appears to be loadstone or magnetic iron ore.

NEW HYDRAULIC PROCESS.—A mining company at Newtown, a few miles below Nevada, are making preparations to work their claims by means of a steam engine which will throw a stream of water, instead of the ordinary hydraulic pressure. Samuel Fair one of the owners, is now engaged in getting up the machinery, and has given us an explanation of the company's plans. The company have already run a bed-rock tunnel for a sluiceway, and the ditch, from whence they will procure water, runs along the rim rock, but not of a sufficient elevation above the mining ground to afford hydraulic pressure for working. The water will be thrown from the engine on the principle of the fire engines in the cities. The San Francisco fire engines which are four or five horse-power, will throw three or four streams of water, of about ten inches each, with a force equal to a pressure of about 200 feet. The Newton company estimates that, with a ten or twelve horse power engine, they can throw a hundred inches of water with a force equal to at least a hundred and fifty feet fall. This process of pipping down banks by means of steam engines has been used to some extent in Colorado Territory; but it was not very successful there, on account of the lack of sufficient gold in the ground to pay. But it will be tried at Newton under more favorable circumstances, and should it prove successful there, we may expect the process will be adopted at other localities. There is a vast amount of good hydraulic ground, in Nevada and the adjoining counties, which can not be worked by the ordinary process for the want of fall, but which may yet be worked by means of steam engines.—Nevada Gazette.

A HEAVY DRILL.—The two great obstacles to the navigation of the Upper Mississippi—the Keokuk Rapids and those near Rock Island—are to be surmounted, partly by the removal of obstructions from the channel, and partly by canalizing. A canal seven and a half miles long, and 250 feet wide is to be constructed around the Keokuk Rapids. Among the instruments used for rock excavations on the Rock Island Rapids is a drill weighing over four tons, and which plows into the solid rock more than four feet at a single stroke.

A NOVEL BOAT.—A boat maker of Troy, N. Y., has constructed one thirty feet long, which weighs but forty pounds, and is in every respect superior to boats made of wood. It is thin, lighter than a wooden boat, is rendered impervious to water by a coating of oil and other compounds, and is claimed to be more durable, and that it will stand shocks that would destroy a wooden shell. Such a boat cannot be split or broken, but if a hole be made in it by accident, the perforation will be no longer than the size of the object piercing it, and could be easily mended; it will not swell or crack, requires no caulking or pitching, and, above all, the cost is much less than a wooden boat.

NICOLSON PAVEMENT ON HEALTH.—It is said that out of the sixty workmen engaged in laying the Nicolson pavement, covering the wood-blocks with tar, in New Orleans, not one has been attacked with yellow fever.

The Emperor's Napoleon's new gun, it appears, is to be immediately put into requisition. Gunboats are already in course of construction, and so put together that they can be readily taken apart and conveyed from place to place.

A MASTODON SKELETON IN NEVADA.—The Virginia Enterprise is informed that the skeleton of a mastodon, in excellent state of preservation, has recently been discovered in Owen's Valley, about three miles from Fort Independence.

CONSOLING.—A French botanist believes that by the end of the present century all the genera of plants on the globe will be described, and that then the only scope for botany will be with species and variety.

SANTA CLARA COLLEGE, S. J. SANTA CLARA, CAL. Conducted by the Fathers of the Society of Jesus.

The SEVENTENTH ANNUAL SESSION of this College will commence on August 23, 1867. TERMS—Tuition in the Classical and Scientific Department, Boarding and Lodging, Washing and Mending of Articles Washed, School Stationery, Medical Attendance and Medicines, Fuel, Light, Baths, etc., per session of ten months, \$350.

THE CENTRAL PARK OF THE PACIFIC. Woodward's Gardens, ART GALLERY, MUSEUM, GYMNASIUM, AND ZOOLOGICAL GARDENS.

THESE BEAUTIFUL GARDENS ARE VISITED DAILY by hundreds of the pleasure-seeking public, and all agree in pronouncing them the best and only first-class suburban resort on the Pacific Coast.

ENTRANCES on Mission and Valencia streets, between Thirteenth and Fourteenth. OPEN EVERY DAY.

FARMERS' AND MECHANICS' BANK OF SAVINGS. 225 Sansoné street, near California.

INCORPORATED under the Act of the Legislature of California, approved April 11th, 1852.

CAPITAL STOCK, \$150,000. DIRECTORS: N. C. Fassett, George M. Condo, Reuben Morton, G. H. Wheeler, Isaac E. Davis, James Laidley, Henry Dutton, B. H. Freeman, Samuel L. Palmer, G. H. WHEELER, Cashier, N. C. FASSETT, President.

DEPOSITS received in gold, silver or currency, payable in like kind, at sight. Funds may be sent by express, or in registered packages by mail. Receipts will be promptly furnished.

WE will receive Gold Dust and Bullion, for refining or assay; make advances on the same, and return proceeds promptly.

Saving Bankers' Drafts, on all parts of the world, furnished at lowest rates, by addressing us. Write names plain. Checks of all banks taken.

Money loaned only on first-class security, safety being our first consideration.

THE Highest Rates of Interest paid on Gold Deposits. DEPOSITS RECEIVED IN SUMS OF \$1 AND UPWARDS. We will keep safely all bonds deposited with us; collect and remit the interest to our friends in the country, as may be directed. For further particulars, address FARMERS' AND MECHANICS' BANK, 215 1/2 Broadway, San Francisco.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the Mining and Scientific Press, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

Stair Work of all Kinds, MADE TO ORDER And Shipped to all parts of the Coast.

Novel Posts and Balusters CONSTANTLY ON HAND and for sale.

N. P. LANGLAND, STAIR BUILDER, No. 49 Beal street, Between Market and Mission, SAN FRANCISCO.

NEW YORK PRICES. WATCH REPAIRING AT NEW YORK PRICES. C. E. COLLINS, No. 603 Montgomery street, San Francisco. EXCLUSIVE AGENT FOR THE AMERICAN WATCH FACTORY. A large assortment of these Superior Watches, In Gold and Silver Cases, Constantly on hand, and sold at Factory prices. Also, ENGLISH AND SWISS WATCHES, Imported directly from the Manufacturers. The American Company are now making VERY FINE WATCHES FOR LADIES. A large assortment of Gold Chains and Jewellery.

WE ARE NOW OFFERING OUR IMMENSE STOCK OF Fine Custom Made Clothing AND Gents' Furnishing Goods AT PRICES THAT DEFY COMPETITION. Our Stock of Clothing Consists of ALL THE LATEST STYLES BOTH OF MATERIAL AND FINISH. A Large Assortment of Trunks, Valises, Carpet Bags, Blankets, Etc., AT EXTREMELY LOW PRICES. J. R. MEAD & CO., Cor. of Washington and Sansone streets.

M. S. WHITING & BERRY, No. 600 Sacramento street, two doors above Montgomery, SAN FRANCISCO.

TEA, WINE AND SPIRIT MERCHANTS, IMPORTERS AND WHOLESALE DEALERS IN FINE Brands Whiskies, Gins, Port, Sherry and Champagne Wines, Ale, Porter, Cider, Bitters, Cordials, Syrups, etc. for medicinal and family use, and suppliers to families, apothecaries, physicians, city and country dealers, hotels, clubs, etc., in large or small quantities. Observe firm name on each cork and fac simile of signature on label. Trade mark registered.

Notice to Miners, Well-Borers and Water Companies.

M. PRAG IS NOW PREPARED TO MANUFACTURE Hydraulic and Artesian Well Pipes in the best workmanlike manner, and at the lowest market rates. Having made large additions to my stock of machinery for the branch of business, I am prepared to fill all orders with dispatch, and guarantee entire satisfaction.

Assayer and Chemist.

A GENTLEMAN WELL VERSED IN ASSAYING AND Analytical Chemistry, is desirous of securing a position in some assaying establishment, or would take charge of the assaying and amalgamating department of either a gold or silver mine. Steady employment, rather than high wages, is desirable. The advertiser would take his own laboratory to the mine if desired. Proper references given. Inquire at this office.

Mechanical Drawings. Persons wishing Mechanical Drawings can obtain the services of competent draughtsmen, by applying to this office.

HAYWARD & COLEMAN, IMPORTERS AND REFINERS OF Illuminating, Lubricating, AND PAINT OILS! CONSISTING OF KEROSENE, LARD, SPERM, ELEPHANT, POLAR, TANNERS, NEATSFOOT, BOILED AND RAW LINSSEED, CASTOR AND CHINA NUT. ALSO, SPIRITS OF TURPENTINE & ALCOHOL. Note.—We would specially call the attention of MILL OWNERS and ENGINEERS to our superior PARAFFINE OIL, which we manufacture from the California Petroleum. This Oil will not gum. Machinery thoroughly cleaned and lubricated with it will not heat and after remaining at rest, can be started without cleaning.

Golden City Chemical Works. LABORATORY, Corner of Seventh and Townsend Streets. OFFICE, Corner of Montgomery and Bush Streets. CAPITAL STOCK, --- \$500,000. Trustees: H. P. WAKELEE, THOS. H. SELBY, NICHOLAS LUNINO, THOS. BELL, CHAS. E. MCCLANE.

Dr. Hufeland's Swiss Stomach Bitters. THE WORLD RENOWNED REPUTATION, TOGETHER with the excessive and increasing demand for Dr. Hufeland's Swiss Stomach Bitters, will at once recommend them to the favorable notice of all connoisseurs and lovers of a good and healthful tonic and invigorator.

Pratt's Abolition Oil. FOR ABOLISHING PAIN—THE BEST REMEDY IN EXISTENCE for Rheumatism, Neuralgia, Paralysis, Headache, Toothache, Sore Throat, Diphtheria, Weak Swollen and Stiff Joints, Contracted Cords and Muscles, Cramps, Colic, Diarrhea, Cholera, Pains in the Breast, Lane Back, and all aches and pains. It is the poor man's friend, and the best family physician. Full directions accompany each bottle. Price 50 cents and \$1 per bottle. For sale by all dealers in medicines. Sole Proprietors, A. McBOYLE & CO., Druggists and Chemists, 534 Sacramento street, opposite What Cheer House, San Francisco.

Economy in Advertising.—THE MINING AND SCIENTIFIC PRESS is the best and most economical mining advertising medium in this city. Our terms are less than ONE HALF the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The Press contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

PACIFIC Insurance Company, SAN FRANCISCO, CAL., Office, No. 423 California Street. CASH ASSETS, JULY 1, 1867, \$1,238,054 91. FIRE, OCEAN, MARINE, INLAND INSURANCE. DIRECTORS: Oliver Edridge, J. B. Roberts, S. Steinhart, J. L. Weaver, Wm. Hooper, J. W. Clark, A. Hayward, T. L. Barker, Alex. Weill, Chas. Meyer, Chas. E. McLane, M. Rosenbaum, Henry Carleton, Jr., A. J. Kalsion, T. Lemmen Meyer. New York: Louis McLane, Fredk. Killings, J. B. Newton, J. G. Kellogg, Wm. T. Coleman, Moses Ellis. Sacramento: Edgar Mills, G. W. Mowse, C. T. Wheeler. Maryland: J. H. Jewett. Portland, Oregon: W. Scholle, Morton Cheesman, Jacob Kauma, Virginia, Nevada: Wm. Shuron. OFFICERS: JONA. HUNT, President, A. G. STILES, Vice President. A. J. RALSTON, Secretary, G. A. LATON, Marine Secretary, H. H. BIGELOW, Gen'l Agent.

BLAKE'S PATENT QUARTZ CRUSHER. CAUTION! The owners of the Patent for this valuable machine, in order to facilitate the protection of their rights against numerous infringers, procured, some time since, a reissue of the Patent, bearing date January 9th, 1866. This Patent secures the exclusive right to employ in Stone-Breaking Machines Upright Convergent Jaws, actuated by a Revolving Shaft. All persons who are violating the Patent by the unauthorized making, selling or using machines in which quartz or other material is crushed between upright convergent jaws, actuated by a revolving shaft, are hereby warned that they are appropriating the property of others, and they will be held responsible in law and in conscience. Several infringing machines are made and offered for sale in this city, upon which Patents have been obtained. Manufacturers, purchasers and users, are notified that such Patents do not authorize the use of the original invention, and that such machines cannot be used without incurring liability for damages. BLAKE & TYLER, Agents for the Pacific Coast.

California Steam Navigation COMPANY. Steamer CAPITAL.....CAPT. E. A. POOLE CHRYSEPOLIS.....CAPT. A. FOSTER. YOSEMITE..... CORNELIA.....CAPT. W. BRONLEY JULIA.....CAPT. E. CROCKLEY. One of the above steamers leave BROADWAY WHARF at 4 o'clock P. M. EVERY DAY (Sundays excepted), for Sacramento and Stockton, connecting with light-draft steamers for Marysville, Colusa, Chico, and Red Bluff. Office of the Company, northeast corner of Front and Jackson streets. B. M. HARTSHORNE, President.

It is a Fact, That BOWMAN'S AMERICAN WASHING COMPOUND is the best article for Washing and Cleaning yet discovered. It is acknowledged to be a saving both in money and labor. As the compound softens the dirt, the clothes require not more than one-half the rubbing necessary in washing by the old method; besides all who give it a trial acknowledge that their clothes are whiter in washing with this Compound than they were ever known to be by using any other preparation. For washing woolen goods and flannels, it cannot be equalled. Articles that cannot be washed with soap without fading are washed in the water used for boiling white clothes. This Compound has been used in the Eastern States for the past three years, with perfect success. WARRANTED NOT TO INJURE THE CLOTHES. For sale by all Grocers. LYNCH & PARSONS, Agents, 229 Jackson street, near Battery. 14v15-3m

Mining Secretary. THE SUBSCRIBER, HAVING SERVED FOR THE LAST five years as Secretary of various mining companies, feels fully competent to serve in that capacity. Any parties wishing to secure the services of a Secretary can be accommodated on reasonable terms. Information given, and all necessary papers correctly made out. Having had a long experience in the purchasing of goods and machinery for miners, parties in the mines will find it to their advantage, where purchasing agents are employed, to send their orders to the undersigned. J. M. BUFFINGTON, 17v15-1f No. 5 Government House, San Francisco.

Copperas! Copperas! 75,000 LBS. IMPORTED COPPERAS—SULPHATE OF IRON—for sale in lots to suit, by SENJ. S. RADY, 109 California street, S. W. corner Davis, up stairs. 13.15-3m

**ENGINEERING PROGRESS.**—The science of engineering has achieved another triumph, in the passage of Mount Cenis by a railway train. That transit teaches a most important lesson in engineering. As is well known, this feat has been accomplished by Mr. Fell's locomotive, which climbs and descends steep ascents, by the aid of two wheels working as friction wheels upon a third or center rail. The experiment has proved that there are few Alpine passes, open to ordinary wheels, which cannot be surmounted by this kind of an iron rail. Napoleon the First said that wherever two men can pass, a road is open to an army; and Mr. Fell may say that since he has conquered Mt. Cenis every practicable pass in Alpine ranges is at the service of the engineer. The great tunnel through the Western Alps is a monument of waste, for the summit can be crossed at far less expense.

**Life Insurance--The Money Drift.**

EDITORS ALTA—Sirs:—I read in your issue of the 11th, a very important statistical paper, compiled by you from the Federal revenue returns, which proves the astounding fact that the distant Life Insurance Companies plying in California through "Agents," draw away nearly one million dollars per annum.

The drain under this head, as you state it, amounts to—  
Year ending 1st August, 1855.....\$496,239  
Year ending 1st August, 1867.....877,264  
And as we write the drain increases and must be now near a million a year—to be a million and a half next year, and so on.

And you naturally ask with surprise why this matter has not been taken in hand by some of our enterprising insurance men, so as to arrest the flight of a moiety at least of this enormous drain.

I think, sirs, your question is well put, and though my hands are full, I am yet willing to step forward and assume some of the responsibility and bear some of the preliminary expenses of forming such a Company.

When you reflect, sirs, that this million dollars a year is carried over land and sea, thousands upon thousands of miles, to places where it is lent out by distant Managers and Directors to their manufacturing and commercial friends around them, at five per cent. per annum, while our merchants and manufacturers, who are to compete with these, have to pay fifteen per cent. per annum for money [we supply them with the golden weapons to beat us] you will then conceive the magnitude of the injuries effected by the sapping and mining operations of those distant Insurance Companies. The money which must drain away, day by day, steamer after steamer, from our people, will, if not stopped, impoverish this country quite as much as if it were conquered by a foreign power and held in perpetual tribute. A million a year, by compound interest, will be ten millions in five years, twenty millions in ten years, forty millions in fifteen years, eighty millions in twenty years, one hundred and sixty millions in twenty-five years, three hundred and twenty millions in thirty years! I will admit that the ordinary percentage of deaths on a business of thirty years will effect a drawback of one third of the income, which in thirty years we will put at one hundred millions. Notwithstanding this, if we go on at our present scale of draining, we shall in thirty years lose by the insurance operation two hundred millions of dollars! But our drain, if we don't stop it, will not stand at one million a year; it will increase year after year from one million a year to two millions a year, which, by my foregoing computation, would in thirty years foot up to four hundred millions! What it would amount to in sixty years I leave to other calculators. In round numbers, I should guess it would come to the full number of dollars equaling the national debt of the United States!

Now, sirs, I care not what may be said of me by critics or jealous opponents, some of whom cannot see farther than their own noses. I announce myself as ready to make an effort to stop this drain, and I hold every man who co-operates with me a benefactor of his adopted country.

Let the capital of a Local Life and Health Insurance Company be one hundred thousand dollars to begin, in shares of one hundred dollars each. I shall cheerfully take the names of co-operators in a book opened this day, in the office of the California Building and Savings Bank, California street, for that purpose.

I remain, your obedient servant,

THOMAS MOONEY,  
Building and Savings Bank, California street  
November 12th, 1867. 26v15-4v

**HENDY'S  
LATEST IMPROVED PATENT SELF-DISCHARGING SULPHURETS  
CONCENTRATOR.**

**FOR GOLD AND SILVER ORES,  
With Revolving Stirrers and Rotary Distributor.**

This machine is designed for saving finely divided Quicksilver, Amalgam and Gold from the sands and for concentrating and saving the Sulphurets. Any person of ordinary experience with Quartz Mills can readily fit them up and run them.

Those in want of Concentrators would do well to visit some of the quartz mills that have Hendy's Patent Concentrators in use, and satisfy themselves before purchasing other Concentrators of pretended merit. **THEY ARE WARRANTED TO WORK SATISFACTORILY.**

**Directions for Operating Hendy's Concentrators:**

The sulphurets are drawn off while the Concentrator is in motion, in the following manner:

- FIRST—In setting up, set the pan, A, level by the inner rim, near its center.
- SECOND—While in operation, keep the Pan, A, about half full of sulphurets.
- THIRD—Open the gate, E, sufficiently to discharge the sulphurets as they accumulate over the amount above mentioned.
- FOURTH—The crank shaft to make 200 to 220 revolutions per minute.

**References:**

Reference is made to the following mills, which have HENDY'S CONCENTRATORS in use:

EMPIRE MILL (7 Concentrators).....	Grass Valley, Nevada County.
NORTH STAR M. & M. CO. (4 Concentrators).....	Grass Valley, Nevada County.
NORRIDGEWOCK MILL. (2 Concentrators).....	Grass Valley, Nevada County.
VALENTINE & CO., Commercial Mill (3 Concentrators).....	Nevada County.

GUADALUPE & SACRAMENTO G. & S. M. CO.....	Sinaloa, Mexico.
EL TASTE CO. (2 Concentrators).....	Sonora, Mexico.
B. F. BROWN (1 Concentrator).....	Melbourne, Australia.

And in use in many other parts of this coast.

The following give additional proof of the increasing popularity of the machine:

SAN FRANCISCO, October 10th, 1867.

J. HENDY, Esq.—Dear Sir:—To your request for an expression, in writing, of my opinion in regard to the merits of your Concentrator, I reply, that I consider it the best machine for saving quicksilver and amalgam, and for concentrating sulphurets, that I have ever used, or seen used. I may add, that I could give you no stronger proof of this than to order, as I did, six more of them, after a trial of one for several months. I shall take pleasure in showing the machine in operation to any one interested, who will call at the mill of the Empire Company, in Grass Valley. Yours,

S. W. LEE, Supt.

SUPERINTENDENT'S OFFICE, GOULD & CURRY S. M. Co.,  
VIRGINIA CITY, Nev., Sept 17, 1867.

JOSHUA HENDY, Esq., San Francisco:—Dear Sir:—According to the terms under which I secured from you four (4) of your Concentrators, namely—that they were to be paid for only after a thorough trial had demonstrated their value—I desire to inform you that I have tried them, and have found them to work very satisfactorily, and that they will now be accepted by the Company. You will please present the bill for said Concentrators, say \$1,200, at the office of the Gould & Curry Company in San Francisco. Yours, very truly,

LOUIS JANIN, Jr.

The bill was presented in accordance with the above request, and duly paid.

**CAUTION.**

All of HENDY'S PATENT CONCENTRATORS are marked thus:

"J. HENDY, Patented February 27th and April 17th, 1866."

WILLIAM R. WILLIAMS,  
Sacramento, Cal.

26v13(179-18p) 18v15-3w

IN THE PROBATE COURT OF THE CITY AND COUNTY of San Francisco, State of California.—In the matter of the Estate of HENRY GANAHL, deceased. Order to show cause why Order of Sale of Real Estate should not be made. It appearing to the said Court by the petition this day presented and filed by Andrew H. Smith, the Administrator of the Estate of Henry Ganahl, deceased, praying for an order of sale of real estate, that it is necessary to sell the whole of the real estate to pay the debts, expenses and charges of the administration of said estate.  
It is therefore ordered by the said Court, that all persons interested in the estate of said deceased, appear before the said Probate Court on MONDAY, the eighteenth day of November, A. D. 1867, at ten o'clock in the forenoon of said day, at the Court Room of said Probate Court, at the City Hall, in the City and County of San Francisco, to show cause why an order should not be granted to the said Administrator to sell so much of the real estate of the said deceased as shall be necessary.  
And that a copy of this order be published at least four successive weeks in the Mining and Scientific Press, a newspaper printed and published in said City and County.  
M. C. BLAKE, Probate Judge.  
Dated October 17th, A. D. 1867. 18v15-3w

MINING AND SCIENTIFIC PRESS.—This valuable journal has closed its fourteenth volume and entered upon its fifteenth. It is a publication that should have a wide circulation among our mining and mechanical population. It publishes, in addition to the most complete summary of mining news a vast amount of information on the application of science to mining and the mechanic arts. It contains notices and descriptions of all new mining processes, and all machines intended to facilitate the extraction of the precious metal from ore and rock with which it is blended. It also chronicles all new inventions, and, in most instances, contains drawings to illustrate them. To miners and mechanics it is a paper of incalculable value, and should be in the hands of all who desire to keep themselves posted in the progress being made in these departments.—Treat Union.

San Francisco Metal Market.  
San Francisco Market Rates.

so inadvertently, and from a want of knowledge; and, consequently, of appreciation of what the miner *has done, is doing, and is likely to do for California.* That he has condemned mining from what he has seen, and may see daily, upon Montgomery and California streets. But there is a wide difference between mining in San Francisco and mining in the mountains. Stock jobbing is not mining; but a curse to its prosperity. There are plenty of men in San Francisco who are ready to risk thousands in the fractional part of an incorporated mine, who would not risk the same amount to purchase the whole. When mining is treated more as a business and less as a speculation, it will become more profitable than it has been thus far.

We do not complain so much of what Mr. Hopkins said, as we do of what was left unsaid. There were many gentlemen at that banquet who ought to have had a kindly word for that interest which has, indirectly at least, enriched them. Were there none of the pioneer merchants of Marysville, Sacramento or Stockton present? Were there no merchants present whose trade is almost exclusively with the mountains? Were there no ship-owners or consignees present to appreciate the importance of the mines to the shipping and agricultural interests? Was the foundry business unrepresented there? Has not the mining interest, more than any or all others, transformed the smith's forge of 1850-1 to the mammoth foundries and machine shops of to-day?

Go down to Broadway wharf from the first of January to the last of December—look at the freight, look at the passengers, and ask their destination. Let the Chamber of Commerce look out of their window and ask who is erecting that large building at the corner of Leidesdorff, and who the other one below Leidesdorff, on the opposite side of California. Let them pass from their splendid edifice and proceed down Sansome street to corner of Bush, and observe the Cosmopolitan; thence to First and Fremont streets, between Market and Folsom; then return by way of Montgomery to the corner of Pine; then to Kearny and Clay, by way of Wells, Fargo & Co. and the Mint. Before again entering the Exchange, take a look at the Bank of California—ask who erected this building, whence is derived the business of that establishment? And, finally, let them reflect upon the most gigantic and expensive war ever waged, and ask how that war could have been conducted to a successful issue, but for the gold and silver produced by the mines of California.

In view of all this, we are unable to appreciate the fact that the merchants of San Francisco could assemble upon such an occasion and ignore the great interest which brought them to our shores, and carried them through "fire and water" to their present prosperous and wealthy condition. In the days of the great fires, when one-half the supply of an article was destroyed, the balance doubled in value, and thus the consumer [miner?] paid the insurance. True, the owner of the half destroyed might be, and was, for the day, ruined—yet, to get even, he had to wait only for another fire.

## Craig's Patent Hose Coupling.

In hose and other similar couplings it is a matter of no small moment that the two huts, to which the adjacent ends of continuous hose sections or lengths are lashed, be so constructed as that they may not only be readily and quickly united and disunited from time to time, but also when united form a tight junction and perfect lock, and one that will be little impaired by wear or rough usage. A stud and groove is a general, and,

Fig. 1

perhaps, the simplest mode of forming the entering hut and sleeve that holds the opposite one together, as such mode affords great facility for connecting and disconnecting the two huts; but all such previous constructions have been so defective in establishing a perfect lock against the huts separating accidentally, in twisting or turning and handling the hose so united in sections, that it has even been proposed to

Fig. 2

insert an independent locking screw to prevent the sections disconnecting, excepting when it is desired they should be drawn apart. The liability to loss and breakage, however, of such independent locking-screw, and the time required to work it, are great objections to its general adoption; and the object and nature of this invention which we illustrate is to give an equally or more secure lock by forming the entering hut with studs or projections, and the sleeve that holds the other hut with such peculiarly shaped grooves as that, by the interposition of an elastic ring or washer between the huts, every facility will be afforded for establishing or breaking the connection when it is desired to unite or disunite the huts; yet, when joined, a perfect lock of them will be established by the studs passing the culminating line of gear in the grooves or points that draws the huts closest together, and being held there, to prevent the casual turning of either hose section working the studs out of grooves, by the

elastic character of the interposing ring or washer.

Fig. 1 represents a perspective, and Fig. 2 a sectional view of this improved coupling. A is the outer ring or sleeve, formed with curved grooves, *b*, open at the outer end of the body of the sleeve, and extending from the end or face some distance beyond lines drawn longitudinally with the coupling from the centers from which the curves were struck, so that the inner end or portion of each curve will form a locking cavity or continuation, as shown at *c*, varying somewhat towards the outer end of the sleeve body, that the curve, at its mouth started from B, is the one hut held by an inner annular extension of the sleeve-collar, lapping over an outer collar, to the inner end of the hut which has the usual grooves for lashing to, and round it the one end of a hose length or section. C is the sliding or entering hut to the sleeve, and has the usual grooves for lashing it to the adjoining length or section of hose, and is formed at its interior end with an inner projecting flange, between which and the collar of the other hut, B, is interposed an india rubber or elastic ring, D. Stud or projections, *g*, are arranged round the body of the entering-hut, one for each curved groove or slot, *h*, in the sleeve, and of such diameter or thickness as to enter and fit easily but snugly within the grooves. To afford facility for connecting and disconnecting the entering-hut, C, and sleeve, A, which carries the other hut, and so uniting or disconnecting the adjacent hose sections by simply turning the sleeve or entering-hut. To throw into or out of gear, short arms or handles are made upon opposite sides of both sleeve and entering-hut, and by these being grasped in the hands and forcibly turned while the stud, *g*, is entering the curved slot, the stud passes the culminating point, *c*, of the slot, thereby compressing the india-rubber packing-ring, D, which, upon being relieved of the compression, is still sufficiently compressed to hold the sleeve and hut in their coupled connection. To break the connection, however, it will be necessary to again compress the elastic ring, by the studs working inward on approaching and passing in their return their culminating points or lines, that is, passing from the cavities or continuations, *c*, to the main portions of the grooves, *h*, and thus it will be seen that there is a restraint or lock placed upon the coupling when the connection is fully established, so that no accidental twisting, turning, or handling of the hose sections can break, so as to pass the studs beyond their culminating lines or points, and to compress the elastic ring will require a positive and, though not to an objectionable degree, a considerable force.

A patent was granted for this invention, to William Craig, of Newark, N. J., on Jan. 29th, 1867, and the invention was first described and illustrated as above in the *American Artisan* of Feb. 27th, 1867.

FURS.—It is said that Russian furs have declined in this market fully one half in value since the purchase of Alaska. This is in consequence of European dealers having arrived at the conclusion that American enterprise would soon vastly improve the development of the fur interests.

THE FOG WHISTLE.—One of the mammoth fog whistles, which we have recently noticed, is to be put up near Fort Point by the P. M. S. Co.

## Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[By our Special Correspondent.]

## General View of the Paris Exposition of 1867.

By W. P. BLAKE, Commissioner from the State of California.

## PLATINA—THE RARE METALS—NICKEL, COBALT AND QUICKSILVER.

My last letter upon the silver and gold was incomplete, without a notice of the remarkable exhibit of these metals by Messrs. Johnson, Mattbey & Co., of London, large manufacturers of platinum apparatus for the use of chemists and chemical manufacturers. This firm has filled two large glass cases in the English section with samples of its various products, both raw and manufactured. One case is devoted almost exclusively to a collection of native gold and gold in ingots, in plate and in foil, together with an imposing array of bars of silver from various parts of the world, but particularly from Nevada and Chili.

The collection of native gold contains samples from most of the gold-producing countries, and is formed chiefly of river or "scale gold," and thus presents a great uniformity in its appearance. The samples are very neatly arranged in flat-topped show-holders, and the exhibit is interesting chiefly for the number of localities represented. Most of the largest "ingots" are only models, but having exactly the form and appearance of the originals, they are just as good for the satisfaction of the public curiosity; but notwithstanding the fact that most of the ingots present only the form and appearance of the real article, the actual value of the metals and articles manufactured of them in the two cases, is nearly \$100,000. The attention is first attracted by the enormous size of the platinum boilers used for the concentration of sulphuric acid. These are in the form of stills, nearly four feet in diameter, and are sufficiently capacious to concentrate eight tons of acid a day. They show many improvements over old patterns, but what is most remarkable is that they are made without joints soldered with gold as usual. They may be considered as formed of one piece of metal, and as specimens of autogenous soldering they are remarkably fine and interesting. The price of a still of the capacity of five tons a day is 4,000 francs, and of one that can concentrate eight tons, 62,500 francs.

There is a great variety of smaller platinum vessels, such as evaporating dishes, crucibles, small stills for fluoric acid, syphons, tubes and alembics, all of them showing great skill in forging and working the metal.

Alongside of these vessels we find several large ingots of the metal chemically pure, and intended for the fabrication of sulphuric acid stills.

These ingots are about as large as two bricks, placed side by side, and they were melted under the oxy-hydrogen blow-pipe, according to the method of St. Claire Deville and Debray. A few irregular projections on these masses show how perfectly fluid the metal was, so much so as to penetrate into every small cavity of the mold. There are few of the many persons that look upon these triumphs of science that know that even a small wire of the same metal cannot be melted in the hottest forge fire. Each of these ingots is valued at 1,300 francs. In addition to these ingots there is a model of the great ingot melted for the Exhibition of 1862. This ingot was the largest ever made and weighed 100 kilos., and was valued at 85,000 francs. It is not probable that another ingot of equal size will be produced. The model is therefore of peculiar interest and value.

## APPARATUS FOR ASSAYERS.

Among the great variety of objects there is an apparatus in platina for facilitating gold assays. This, if not already in use by our assayers, should interest some of our establishments in San Francisco, for it is claimed to be a great improvement upon old methods and to give more exact results.

It consists of two shallow kettles of platinum, about a foot across the top, set in holes like those of the top of a stove, so that heat from a gas lamp or stove can be applied below. The nitric acid, for dissolving

the silver out of the assays, is placed in the kettles. A frame of platina, made to fit the kettles, is divided into 200 or more little partitions, into each of which a small platinum cup is placed. These cups are not larger than a child's thimble, and are movable. The bottom of each is pierced with fine slits at right angles, so that the acid can enter when they are lowered with the frame, into the kettle, and so that it may drain out when the frame is raised. It will be seen that the number of assays is limited only by the number of the cups. No glass is used. By means of this apparatus the pouring off of acid, and the separate washing of each assay is avoided. It has been in use for five years in the laboratory of the firm with complete success. The whole apparatus with two kettles is about two feet long and thirteen inches wide. A porcelain hood covers the kettles and discharges the distilled acid into a vessel at one side.

## MAGNESIUM.

The same firm exhibits an obelisk of pure magnesium, weighing five kilograms, or eleven pounds. The metal is shown, also, in large quantities in the shape of foil for batteries, in ribbons and wires of various sizes. In another part of the Exposition a little apparatus is shown which contains a coil of magnesium wire which may be fed out regularly as fast as it burns. The whole is not larger than a watch, and may be carried in the pocket in readiness for the production of a light almost equal to that of the sun. This would be very useful in caves and in the examination of the dark galleries and chambers of mines, but the direct light should of course be carefully kept from the eye.

## IRIDIUM, OSMIUM AND OTHER RARE METALS.

The exhibition of the rare metals is the most complete ever witnessed, and rejoices the heart of a chemist who perhaps has never before seen more than a grain or two of some which are here shown in massive ingots. Look at that bar of iridium—solid, homogeneous metal, two or three inches long! This is the second which has ever been melted and cast, and was made up of small grains not much larger than the tips of a gold pen. This metal is so hard that diamond dust must be used to cut it, and the question here arises whether in this solid form, we may not use it for tools by which to cut hardened steel, and turn and fashion the hardest rocks.

The bar of osmium which is near by, and is a metal generally found in nature, in close association with iridium, presents a totally different appearance, for it looks like a mass of coke.

Ruthenium is the only one of these rare elements which is not shown in great quantity. We are obliged to be content with seeing a few grains as large as peas. But any disappointment in this case is more than compensated by the sight of a goodly quantity of boron and silicon, and of a remarkable series of the various metals cast in cylinders of equal diameter, but each specimen having the same weight (one kilo. or about two pounds each). The result is, that the cylinders have very unequal lengths, and thus exhibit in a very striking manner their difference in the specific weights of the metals. The series contains gold, silver, platina, iridium, rhodium, palladium, lead, bismuth, copper, cadmium, cobalt, nickel, iron, antimony, zinc, magnesium, aluminum, thallium, sodium, potassium, osmium (not melted), and mercury.

Each cylinder is about one inch in diameter. Quicksilver, which is in a melted state at our ordinary temperatures, and the metals which oxidize rapidly in the air, are confined in glass. The other specimens are just as they came from the mold.

The platinum cylinder is about four inches long; the quicksilver about seven inches, and the others elongate by a very regular gradation up to aluminum, which towers two feet above the preceding, and is in its turn over-topped by the magnesium cylinder nearly four feet long. Thus, at one end of the series, a bar of metal four feet long would just counterpoise the bar of platinum at the other end, and only seven inches long.

In the collection sent from the metallurgical works of Freiberg, Saxony, there is an ingot of the new metal *indium* which was prepared by Prof. Richter, at great cost, and is a great novelty. It is a little puzzling to know, however, whether this ingot is the "real Jacob," or an imitation; for I certainly saw a bar of indium at the exhibition in Chemnitz, Saxony, and only one bar has been made.

## NICKEL AND COBALT.

I have gathered some information in detail upon the manufacture or production of these metals, because we in California now have an interesting locality of such ores in abundance at or near the top of the Sierra

Nevada. These are represented in the collection by the specimens given by Mr. Gaskill.

There are numerous exhibitions of nickel and its ores from various and remote parts of the world. We find specimens from Chili, from Italy, Prussia, Sweden, Austria; also from New Jersey. From the last named locality, Messrs. Wharton and Fleitman send specimens of matte, containing about twelve per cent. of nickel, and some of the ordinary commercial nickel in small cubes, containing 75 per cent. of nickel and 25 per cent. of copper. This is produced from nickeliferous pyrrhotine (magnetic pyrites), and the sulphuret of nickel; which last occurs in crusts at the Gap mine in Pennsylvania. The pyrites is said to contain only about 3 per cent. of nickel.

The Swedish nickel is produced at Kleppa. This ore is also a mixture of nickeliferous pyrrhotine with ordinary copper pyrites, and is shown in large masses. It appears to be taken from heavy beds. The best ore shows by analysis only 2.75 per cent. of nickel and 0.10 of cobalt. The concentrated matte contains 53.74 per cent. of nickel and 25.46 of copper. The small cubes contain 66 per cent. of nickel and 34 of copper. Another quality contains 72 per cent. of nickel. The establishment produces annually 85,000 kilos. of concentrated nickel matte, containing from 53 to 56 per cent. of nickel and 24 to 27 per cent. of copper, seven per cent. of iron and 13 per cent. of sulphur.

The price of the products varies according to the percentage of nickel. The ordinary matte, containing from 50 to 56 per cent. of nickel, is worth 6.70 francs the kilo of nickel. For example, 100 kilos. of matte of 54 per cent. is worth about 362 francs. For a 60 per cent. matte, the price is about 504 francs for 100 kilos.

A cobalt and nickel company in Hungary exports a crude product containing 48 per cent. of nickel and cobalt to England, to the extent of 1,000,000 kilos. a year, (about 2,200 tons.) Further details are not of sufficient interest to be given here.

## QUICKSILVER.

The finest display of ores and the metal is made by the Old Almaden mine of Spain. It has sent twenty or thirty solid blocks of cinnabar more than a foot square. This ore is of finer grain than ours from New Almaden, but the color is not so brilliant. The Old Almaden ore looks more like the red oxide of iron. A large flask of native quicksilver is found with the collection.

Algeria sends some very large masses of ore in which the cinnabar is associated with carbonate of lime, very much as in our California mines. This association appears to be as characteristic of cinnabar as that of quartz with gold.

Most of our California localities are represented, but not by large and brilliant specimens. I am told by a Californian who has recently returned from there, that the Old Almaden mine is worked in a very rude manner, and that one of the most ancient single acting steam engines is still at work there raising water.

Paris, Sept. 11th, 1867.

(Entered according to Act of Congress in the year 1866, by F. A. Herring, in the Clerk's Office of the District Court of the District of California.)

## Formation, Distribution and Age of Igneous Rocks.

Concluded from Page 274.]

There seems to have been three of the anticlinal, or volcanic lines or ridges running nearly parallel, the central one being the present summit of the Sierra Nevada, the westerly volcanic axis along the line from Oroville to Folsom, and the easterly anticlinal line running in a northerly and southerly direction from Mount Davidson, Nevada. The ore in the newly discovered mine described by W. T. Rickard, must have been erupted at a period when the eastern flank of Mount Davidson was nearly if not quite level, for the limestone which forms a part of the vein is unquestionably a deposit which was formed under water. At the ancient anticlinal axis, at Folsom, the stratum of decomposed quartz rests upon the hard gray granite, and dips underneath the high hills east towards the summit of the Sierra Nevada. This amiferous stratum is now lower than the bed of the American river, but the granite must have been above water, when it was covered by molten quartz of the manner of the lavas of a later period. And when we consider the fact, that the gold in this deposit is not what the miners term "washed" gold, it is impossible to conceive how the quartz found

in this way there upon that ancient anticlinal axis in any other manner. Immediately overlying is a marine deposit 20 feet in thickness, and along the same axis or line at Butte Creek is another similar deposit, filled with mollusca. At the beginning of the old red sandstone period, the solid crust of the earth was probably about 15 miles in thickness, and it was possible for a synclinal line to be no farther from an anticlinal axis than 15 miles. But when the solid crust had increased to 50 miles in thickness, the synclinal line would be removed not less than 50 miles from the anticlinal axis. Now from Folsom to Mount Davidson is not less than a hundred miles, in a direct line. Thus it will be seen how the original flanking anticlinal lines or axes, each 50 miles or thereabouts from the central anticlinal axis, might become synclinal lines, during the process of the upheaval of mountain ranges, in consequence of the increased thickness of the earth's crust. During the old red sandstone period the solid crust increased to about 25 miles in thickness, to which was added 12 miles during the carboniferous era. The deposits upon these ancient anticlinal lines, show them to have been submerged during the upheaval and widening of the Sierra Nevada. This period of submergence probably began in the carboniferous era, and continued up to the cretaceous period.

Thus it appears that the changes in nature are slow and uniform, and that the great forces which elevated and built up extended chains of mountains, have operated through vast periods of time. When the crust of our globe was thin and unable to support elevated mountains, the vast ocean which covered the whole earth was dotted with islands. As the crust gradually became thicker and stronger, some of the low islands disappeared, while others grew to extensive tracts of land, then to continents, diversified with hills and valleys, and vast ranges of mountains were built by repeated elevations and additions on sites selected by the Great Architect.

I am well aware that these views, respecting the time and manner of the upheaval of extended chains of mountains, differ somewhat from the commonly received opinion. Agassiz says: "It is in accordance with an invariable rule, by which the relative age of mountains may be estimated, that the oldest mountains are the lowest, while the younger and more recent ones tower above their elders, and are usually more torn and dislocated also. This is easily understood when we remember that all mountains and mountain chains are the result of upheavals, and that the violence of the outbreak must have been in proportion to the strength of resistance. When the crust of the earth was so thin that the heated masses within easily broke through it, they were not thrown to so great a height, and formed comparatively low elevations, such as the Canadian hills or the mountains of Bretagne and Wales. But in later times, when young and vigorous giants, such as the Alps, and Himalayas, or later still, the Rocky Mountains, forced their way out from their fiery prison-house, the crust of the earth was thicker, and fearful indeed must have been the convulsions attending their exit."

In a recent lecture, he endeavors to show that the Rocky Mountains have been entirely upheaved since the cretaceous period. Now the Rocky Mountains are capped by some of the oldest land, the gneiss formation; huge cones of granite are piled upon them, and they are intersected by veins of the intrusive rock of all ages, including metal-bearing quartz, showing their structure to be similar to that of the Sierra Nevada. He evidently errs in supposing their upheaval to have been so recent, so violent and sudden, when he only produces evidence of their recent completion. Then the rugged and torn appearance of some mountains is more due to the refractory character of rock composing them, than to the time or manner of their upheaval. It is quite true that when the crust of our globe was thinner, it was unable to support lofty and extended chains of mountains; but it does not necessarily follow that the building-up process of such mountains should not have begun with the earliest upheaval. Future explorations will show that there are other tracts of land on the North American continent, quite as anciently upheaved as the Laurentian Hills in Canada.

I cannot help believing that Agassiz and his followers attach too much importance to glacial action. They advance the extraordinary theory that what they suppose to be glacier-marked territory, was once covered with ice a mile or more in depth. They speak of the drift period as if it belonged

to some particular age, when in fact it includes all ages since water rested upon the heated surface of our earth. They see drift six thousand feet up the side of a mountain in Maine, and arrive at the absurd conclusion that Maine was at one time covered with ice six thousand feet deep. Now there are deposits of drift at a greater altitude on the Sierra Nevada, high above the present water courses; yet no miner who is familiar with their appearance supposes their origin to be due to glacial action, from the fact that they present every indication of hydrostatic action. To account for such an extraordinary degree of frugidity, they advance the idea that the supposed glacier-marked territory was once much more elevated than at the present time. It is not probable the intrusive igneous rocks, intersecting such territory, will present any evidence of such an extraordinary upheaval. On the ground of the ever-increasing thickness of the earth's crust, it may be safely affirmed that the average height of all the mountains upon our globe, is greater to-day than at any former period. I can see no evidence that the temperature of our earth was ever below its present average. In geological time, the advent of mammals is a recent occurrence, a fact showing the atmosphere to have been loaded with poisonous gases. And the further we go back into primeval time, the more compound, extended and dense, must have been the atmosphere, and its increase in apparent heat according to well known laws, would correspond with its decreased capacity for heat, consequent to its greater density.

Kind reader, while this subject affords a field of research to the man of science, I have endeavored to present what to my mind appears to be the plan of the distribution of igneous rocks, in such a manner that all may comprehend it, reserving to myself only the right of future publication. Comment and suggestions are invited, to the end that if the theory proposed proves to have foundation in truth, this paper will be republished with such conditions and additions as further research and reflection may dictate.

#### Extraction of Gold, Silver and Copper.

We quote the following, as the conclusion of the chlorination process on sulphurets, described and illustrated in detail, in Kustel's new work on Concentration and Chlorination, now in press, and shortly to appear.

Sulphurets, or ores containing sulphurets, cannot be treated either with chlorine or with chlorinated water without roasting, no matter how fine the ore may be reduced. Besides the great quantity of chlorine which would be consumed, in either way, by the decomposition of sulphurets, there will always be formed some chloride and sulphate of iron, both of which precipitate the chloride of gold, if such should be formed, and would prevent its extraction. If there is silver present, it is converted into a chloride, and this is also the case with the copper; but the sulphur must be driven out before the chlorination.

The chloride of copper is soluble in water, and can be leached together with the gold; but the chloride of silver remains undissolved in the residue; it is, however, soluble in a saturated solution of common salt. If, therefore, chlorine is conducted through a salt solution, to saturation, this saturated solution dissolves gold, silver and copper at the same time, if the ore, containing such metals is treated therewith. On this principle Patena and Roeszner subject auriferous silver ores first to a chlorinating roasting; the roasted ore is then charged into tubs with false bottoms, and the cold solution of salt and chlorine added. Silver ore from Arany-Idka (Hungary), treated after this method, gave 98.94 per cent of silver, all the copper, and nearly all gold. An experiment on five tons of ore gave a clear profit of seventy-five florins, compared with the amalgamation.

Roeszner roasts the ore with salt, extracts a part of the silver by Augustin's method, with a hot solution of salt, and treats the residue alternately with a solution of salt and chlorine, and hot concentrated solution of salt for the extraction of gold, and the remainder of the silver.

It is not absolutely necessary to roast the ore with salt, especially if the copper is not regarded. There is a class of silver ore found in considerable quantities in Nevada, which, treated on a small scale with chlorinated salt solution, gives nearly 50 per cent. of its silver, without roasting, provided it is ground very fine. The ore in question is principally the argentiferous carbonates, containing some copper, antimony and lead.

It has a greenish or black, dull appearance, generally rich in silver—frequently occurring at Blind Springs, Hot Creek, Humboldt, Loan Pino, and in Idaho. There is also a light yellow earthy mineral, in the form of powder, composed principally of antimony, lead and silver, (Pahranagat, Arizona, etc.); also the Stetefeldite and Partzite (both probably the same mineral, and in regard to origin, likely connected with the above named carbonates.) The last two minerals are greenish black, or black, with a peculiar horny appearance, and also rich in silver.

In treating these ores without roasting, besides the above mentioned proportion of silver, copper also comes into the solution. It may be expected, that, operated on a large scale (the ore properly ground, for instance, with the newly constructed Varoey's quartz grinder), a more favorable, and perhaps satisfactory result could be obtained, without roasting, than experimenting on ounces; but a calcination, sufficient to drive out the carbonic acid, appears advisable, especially if the ore, with the solution, should be subjected to a slow revolving motion, (in a barrel) whereby the evolution of carbonic acid becomes very inconvenient. A proper furnace might be sufficient to calcine from ten to fifteen tons of the named ore in twenty-four hours.

This mode of extraction, roasting the silver ores with salt, is very important, on account of the close percentage which is obtained, and also for the reason that the copper can be precipitated in metallic condition by itself, at the same time.

The precipitation of the metals, in the solution, after leaching, can be effected in different ways. A dilution of the salt leach, with water, produces a white precipitate of chloride of silver. It takes about twelve hours for all the silver to settle, and the fluid to become clear, ready for precipitation of gold by sulphate of iron. After this, the fluid, when clear, is conveyed into tanks containing pieces of old wrought iron, for the purpose of precipitating the copper. This is the cheapest way of precipitation; but the further reduction of the chloride of silver, by means of zinc and sulphuric acid, is troublesome, and it might be preferable to amalgamate the chloride with sodium, amalgam and iron filings, which, according to Professor Wurtz, is performed almost instantly. Another inconvenience is the quantity of water required for the precipitation of the chloride of silver, amounting at least to one half of the volume of the lixivium, diluting it thus too much for the copper precipitation.

Sulphureted hydrogen, or poly-sulphide of sodium, precipitates silver and copper together, as sulphides; it is, therefore, the most proper way to precipitate the gold and silver in metallic condition, by metallic copper, and then both the dissolved precipitating copper and that from the ore, by means of old iron.

It seems that if the lixivium should not be rich enough for precipitation, the same could be saturated again with chlorine and applied to another charge of roasted ore. That might be, perhaps, repeated even after the gold and silver has been precipitated once or twice, thus considerably diminishing the expenses of extracting. It is only necessary to keep the solution always saturated with salt before the chlorine is introduced. In order to utilize the chlorine (generated according to Sec. 58) to the best advantage, the salt solution must be divided into many chlorinating vessels, so that the chlorine is forced to pass several times through the fluid.

**A BOILING LAKE.**—There is a singular boiling cauldron, or lake, near Humphreys Station, in Monitor Valley, Reese River, which is said to be well worthy of a visit. In the center of a low, round hill, composed of sedimentary matter, there is a natural bowl about seventy-five feet in diameter, and apparently sixty or seventy feet in depth. At the bottom there is a large volume of scalding hot water constantly in active ebullition. The water is so remarkably pure that a stone thrown into it is seen descending with a slow spiral motion to a great depth, being gradually drawn toward the point where the spring seems to burst from the rocks beneath. The lake has no outlet, and the water stands at about 20 feet below its banks.

**THE FRIEND OF INDIA** says that, owing to the heat, half the engine-drivers on the East India Railway are sick. "The other day," it adds, "a train was stopped at Hooghly with the stoker dead and the driver dying."

**A GIRL**, ten years of age, was resuscitated at Rumney, Mass., twelve hours after she was supposed to have been drowned. She did not regain full consciousness for more than two days.

#### Scientific Miscellany.

**FLIGHT OF BIRDS—BALLOONING.**—The force of gravitation, paradoxical as it may seem, is really the very force which makes flight possible; and it has recently been remarked as very singular, how completely this fact has been lost sight of in all attempts to navigate the air. A bird lighter than the air, at the surface of the earth, might float in that medium a short distance above the earth, where the stratum of air is not so dense; it might move along, indeed, with the current of air in which it floats; but any effort at flight would be awkward indeed—it would be a mere awkward flopping instead of the graceful motion of flight. So with a balloon. To navigate the air on the true principle of the flight of a bird, the machinery of the balloon must be so constructed as to raise it long before it is sufficiently buoyant to float. Again, to navigate with wheels or sails, as a boat, the balloon must occupy a position where it will encounter either two elements, or one where the same element presents a marked intermediate line of great difference in specific gravity.

All attempts at ballooning have heretofore been attempts to do something on a principle quite diverse from any natural action. No bird is ever, for an instant of time, lighter than the air in which it flies; if it was it would be as powerless for flight as a balloon; but being, on the contrary, always heavier, it is in constant possession of a force (gravity) capable of being converted into momentum, and therefore able to overcome the resistance of the atmosphere, or even a moderate gale of wind. If ballooning is ever made practicable for moving from point to point, at will, its machinery will be employed for elevation rather than propulsion. Gravitation must be made, in ballooning, as in flying, the most essential part of the process available for the object in view.

**THE "FIRM EARTH"** has been proven, by unflinching tests, to be not so firm after all. It is now considered an unsteady base for science. Dr. Robinson has reported to the British Association, that "he found the entire mass of rock and hill on which the Armagh Observatory is erected, to be slightly, but to an astronomer quite perceptibly tilted or canted, at one season of the year to the east, at another season to the west." And what is still more startling to the astronomical world, the Greenwich transit instrument the very ark of the covenant of scientific certainty itself, has wavered. The high priest of that *sanctum sanctorum* of science, Prof. Airey, the Astronomer Royal, makes the alarming confession as follows: "While the construction of this instrument, and the modes of observation with it, have given a warranty such as the world never possessed before, for the steadiness of the instrument and its adjuncts, there have been instances where the azimuth of the instrument, greatly to the surprise of the astronomer, has varied four seconds, as determined by opposite passages of the polar star." Mr. Airey has no other way of explaining this than by the supposition, that "the sound and firmest earth itself is in motion." A supposition fatal to the scientific certainty of observations made on such a tremulous basis; for if the whole hill on which Armagh Observatory stands, can be canted to the east and to the west, and if the solid earth at Greenwich has been detected in wavering four seconds, who can assume greater stability for any other observatory? Or who can tell whether such trepidations have not vitiated the most far reaching observation? It is only occasionally that sidereal rectifications can be made, and in all intervening hours nobody can tell how much wavering may arise from the secular and magnetic expansions and contractions of the earth, which physical geographers assure us are continually active. Yet we are asked to accept visionary theories of the formations of worlds, based on observations of minute angles, where the error of the tenth of a second in the parallax of a distant star involves an error of distance of thousands of millions of miles! The whole modern theory of the lenticular formation of this earth's universe, and of the actual distances of the fixed stars, has absolutely no broader basis of observation than the ac-

curacy of observations of the sixtieth or hundredth part of a degree. What then are we to think of the scientific certainty of observations continually exposed to such disturbances and jostlings.

**NEW METEORIC THEORY.**—Richard A. Proctor, an astronomer of some reputation, contributes a paper to the last number of *Temple Bar*, which, in connection with the late meteoric shower, has special interest. He advances the hypothesis, which he states to be that of Adams, Leverrier, Schiaparelli, Weisse, and many other eminent astronomers, that these meteors belong to the trains of comets. The evidence upon which this is based is as follows:

An examination of a small comet last year—Temple's comet—by means of a spectroscopic (which, by analyzing the light emitted by a luminous body, shows to some extent of what that body is composed), proved to the satisfaction of astronomers that the nucleus consists of incandescent vapor, shining by its own light, and the coma of incandescent solid or liquid matter, or more probably of widely dispersed solid or liquid particles, which shine by reflecting the sun's light. On the night of Nov. 14th, 1866, when a great meteoric shower took place in Europe, the earth was near the orbit of Temple's comet. And it has been proved by laborious calculations, conducted in different ways by Adams and Leverrier, that the path round the sun of the meteors seen that night coincided exactly with the path of Temple's comet though that comet was then millions of miles away. These calculations were undertaken and conducted without any thought of the result to which they led. The paths of other showers of meteors have since been identified with the orbits of other comets, and in the language of Mr. Proctor, "It would seem that the great April aerolite shower, which sends down solid masses upon the earth (of which four are known to have fallen in England alone), follows the path of the great comet of 1861."

From this it is concluded that comets are followed by trains of cosmic dust, of which the tails are the denser part, and that the tenuity of the tails is due to the wide dispersion of the particles composing them.

**ANALYSIS OF BLISTER STEEL.**—David Forbes, F. B. S., has communicated to the *Chemical News* the results of his analysis of specimens of blister steel, which will be examined with interest because analyses of such steel are rare and seldom found in chemical works. The per cent. results are as follows: Iron, 99.116; carbon, combined, 0.627; graphite carbon, 0.102; manganese, 0.120; silicon, 0.030; sulphur, 0.005. No trace of phosphorus was found, although search was made for it by several different methods.

**MOLTING OF FISHES.**—M. Baudelot, in a paper read before the French Academy of Sciences, says tubercles are often observed on the sides of fishes, accompanied by the falling off of the scales; these were sometimes considered a characteristic of a new species of fish. They are, however, periodical, and found only at certain seasons of the year, thus constituting a true molting.

**ANTI-INCORUSTATION SOLUTION.**—To prevent the formation of strongly adhesive sediments in a steam-boiler, mix 125 kilograms of crystallized chloride of barium dissolved in 50 of water, with 25 kilograms of hydrochloric acid having a specific gravity of 1.20; apply 15 parts by measure, of this acid solution to every 1,000 parts of water to be used in the boiler.

**DOUBLE SESQUICHLORIDE OF IRON AND SODIUM.**—F. Landauer has produced this new compound by the action of hydrochloric acid on artificial ultramarine. By writing upon paper with the solution and afterward warming it, the letters become black, just as in the case of some sympathetic inks, but the writing does not disappear by the action of water.

**RED LEAD.**—Barton produced red lead by heating the oxide of lead to redness with nitrate of soda, or by heating at the same temperature a mixture of 1,894 parts of sulphate of lead, 665 parts of carbonate of soda, and 177 parts of nitrate of soda. The resulting mass is to be washed.

**BRONZE AND STEEL ORDNANCE.**—The French Government are now testing guns having an interior of steel and exterior of bronze. It is supposed each cannon combine the maximum of wear with the maximum of liability to explosion.

New Patents and Inventions.

Under this heading we shall mention, from week to week as occasion may demand, New and Important Inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent Issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

RECENT INVENTIONS.

**A NEW NEEDLE.**—Messrs. G. A. Lloyd and S. Titlow, of this city, have recently invented a needle which may be employed for making sails or for common sewing purposes. It is round like the common needle, but the eye is placed at a distance of one-fourth the length of the instrument from its heel. The object of this construction is to give ample leverage to the thimble or palm to put the loop of the thread through the cloth. A groove extends from the eye around the heel of the needle, so as to take in the thread or twine, and enable it to readily follow the point. Capt. Lloyd is a sailor, and was led to this invention by a practical knowledge of the difficulty attending the roping of sails and other heavy work. The change in the sail needle from its triangular shape to that of a round shaft is so apt to follow the course of the present instrument. The round shaft leaves a hole which more readily closes up, tightly, upon the thread than does the angular hole; and, for that reason, is especially preferable for use in making hydraulic hose, etc. The ladies, we opine, will encounter less of the breaking of needles when they are made after this patent than when made as at present, so that the indentation of the thimble comes in direct contact with the portion weakened by the punching of the eye. This is the only important improvement which has been made in the form of the common sewing needle, for aught we know, since Eve first used the instrument for sewing fig leaves. We trust the inventor will find it as profitable as did Howe in his sewing machine needle.

**NEW DAVIT HOOK.**—More lives at sea have been lost by parties trying to unhook the davit hooks of small boats, lowered during storms, than in any other way, not taking into consideration fires and wrecks. Our friend, Mr. Jos. Condon, says the Meadow Lake Sun, has invented a new way of fastening the hooks, which is extremely simple, and which works well in all respects. By the Condon fastening both hooks can be easily unhooked at the same instant and with perfect safety. It seems strange, after seeing this new arrangement, that the like has not been thought of before. Had the hook been in use years ago, thousands of lives might have been saved.

**A NEW GATE** is on exhibition, in model, at the Merchants' Exchange, recently invented by Smith & Hudson. In place of opening outward, and swinging on hinges from the gate post, this gate raises up, on the principle of the toy used by our grandmothers, and known as "lazy-tongs." The pickets work on screws, and when the gate is pushed up, which movement is facilitated by a heavy weight at one end of the upper horizontal bar, the pickets fall together, and the whole affair assumes a vertical position, folding upon itself, and standing close up to the post on which it is hung. The idea is a novel one, and many advantages are claimed for it over the old style. The same was on exhibition, of full size, at the recent State Fair, in Sacramento, where it elicited much consideration.

PATENTS RECENTLY ISSUED.

**70,256.**—MEANS FOR SETTING, FURLING, AND REEFING SAILS.—Charles Peterson, San Francisco, Cal.: I claim, 1st, The within-described mode of setting, furling, and reefing sails from the deck of a vessel by means of the swivel-booms, D, swivels, G, H, and ropes or chains, 1, 2, 3, 4, 5, 6, 7, and 8, substantially as described.

2d, Setting, furling, and reefing stay-sails and jibs by rolling them on the stay, substantially as described.

3d, Setting, furling, and reefing the upper square sails from the deck by means of two sets of ropes or chains only, operating together with the swivel-booms, D, substantially as described.

4th, A swivel boom, around which the upper square-sails are rolled or furled, substantially as described.

5th, An india-rubber cap, P, on the end of the rotating spar, for the purpose and in the manner set forth.

6th, The swivel, D, provided with friction

balls, substantially as described, for the purpose specified.

7th, An india-rubber roller over the periphery of a sheave, substantially as and for the purpose described.

8th, A stay for ship sails constructed of metal links, substantially as described.

9th, The combination of the swivel, H, link, I, and swivel, G, substantially as described, for the purpose specified.

10th, The india-rubber covered rollers, g and g', in combination with the india-rubber covered boom, E, substantially as and for the purpose described.

11th, The guide-rope, 5, in combination with the courses, substantially as and for the purposes described.

**70,321.**—APPARATUS FOR REDUCING QUICK-SILVER ORES.—Joseph C. Coult, San Francisco, Cal.: I claim, 1st, The fire-chambers, B, B, ore-chambers, C, C, and vapor-chamber, D, arranged together and with a steam-tank above them, as and for the purposes set forth.

2d, The arrangement of the pans within the chamber, D, with alternate spaces between their sides and the walls of the chambers, as and for the purpose set forth.

3d, The silvered wire screens, c, c, c, in the condensing-flue, E', used as and for the purpose set forth.

4th, The arrangement of the flues, H, H', H'', water-tanks, I, and partitions, J, J, substantially as and for the purpose set forth.

5th, The arrangement of the steam-pipe, F, and its orifice, K', with the orifice, K, for creating a draught, as and for the purpose set forth.

**70,354.**—BOAT-DETACHING TACKLE.—Charles Peterson and Charles Gunnar, San Francisco, Cal.: We claim, 1st, The rods, C, attached to the bottom of a boat, their upper ends being free and provided with loops, c, substantially as and for the purposes described.

2d, The sleeves, D, D', on the rods, C, substantially as and for the purposes described.

3d, The rods, B, B', pivoted as described, in combination with the rods, C, sleeves, D, D', and ropes b and d.

4th, The roller or drum, e, pivoted in a slot in a thwart or cross-board and provided with a lever, f, substantially as and for the purposes described.

5th, The detaching device consisting of the rods, B, B', and C, sleeves, D, D', ropes b and d, and roller or drum, e, provided with a lever, J, and pivoted in a slotted thwart or board, substantially as described.

**NEW INCORPORATIONS.**—Articles of incorporation have recently been filed in the County Clerk's office in this city as follows:

**CALIFORNIA MUTUAL LIFE INSURANCE CO.** San Francisco. Nov. 16th. Capital stock, \$100,000, with a Guarantee Fund of \$250,000; 1,000 shares, \$100 each. Trustees: David Stern, Thomas H. Selby, L. Sachs, John E. Miller, J. Mora Moss, William C. Ralston, Oliver Eldridge, Eugene Casserly, Joseph A. Donahue, Myles D. Sweeny and Orville C. Pratt.

**UNIVERSITY HOMESTEAD ASSOCIATION.**—San Francisco. Nov. 20th. Capital stock, \$136,400; 341 shares, \$400 each. Trustees: L. L. Robinson, J. Babcock, T. B. Lewis, J. F. Michel and O. S. Hatch.

**ELECTION OF OFFICERS.**—At a meeting of the Stockholders of the Bay View Homestead Association, held on the 19th, the following officers were elected. Trustees: Asa R. Wells, Henry B. Forester, Arthur B. Stout, William H. Bryan, Henry O. Howard, Joseph De Forest and William A. Woodward. Silas Selleck, President; Henry A. Crane, Vice-President; Henry F. Williams, Treasurer; A. S. Gould, Secretary.

**CONFIDENCE S. M. CO.**—San Francisco. Nov. 8th. Trustees, A. E. Head, Wm. S. Head, Geo. W. Beaver, R. F. Morrow and Frank Levington. A. E. Head, President; R. Wegener, Secretary; Charles Foreman, Superintendent.

**MOORE'S FRICTION HOIST.**—We would call the especial attention of merchants and miners to the advertisement, in another column, of "Moore's Friction Hoist"—one of the best inventions of the kind extant. We shall give an illustrated description of it as soon as the necessary engravings can be prepared.

**PICNICS.**—All in search of health, pleasure, or recreation, will find Woodward's Gardens one of the most desirable places of resort this side the garden of Eden.

Valuable Books on Mining, Mineralogy, Geology, Metallurgy, Etc.

- ANSTED'S Gold Seekers Manual. 1 vol. 12mo. cloth. \$ 1 75
- ANTISELL.—The Manufacture of Photogenic or Hydro-Carbon Oils from Coal and other Bituminous Substances, capable of supplying Burning Fluids. By Thomas Antisell, M. D. 1 vol. 8vo. 3
- BARSTOW—Sulphurets; What they are, How Concentrated, How Assayed, and How Worked; With a Chapter on the Blow-pipe Assay of Minerals: 1 vol. 12mo. cloth. 1
- BLAKE, W. P.—Geological Reconnaissance in California in 1853-4. 4to., with plates, maps, sections, etc. 10 00
- BLAKE, W. P.—Silver Ores and Silver Mines, etc. 8vo. 2 00
- BLAKE, W. P.—Mining Magazine and Journal of Geology, etc. 8vo. 5 00
- BLAKE, W. P.—Annotated Catalogue of California Minerals. 8vo. 5
- BUCKLAND (Rev. Wm.)—Geology and Mineralogy. 2 vols. 8vo. cloth. 10 00
- BOURNE (John)—Handbook of the Steam Engine, illustrated. 2 vol. 12mo. cloth. 3 00
- CONGDON.—Mining Laws and Forms of California and Nevada, and the Mining Ordinances of Mexico. 184 pp. 8vo.; flexible cloth; 1854. (The only compilation extant) 2 50
- DUFRENOY.—Mineralogie. 5 volumes, 8vo. 20 00
- DANA'S Manual of Mineralogy. Revised edition. 250 illustrations. 12mo. cloth. New Haven, 1853. School Edition. 2 25
- DANA'S Manual of Geology. Numerous Illustrations. 8vo. half morocco. Philadelphia, 1853. 6 75
- DANA'S Text-Book of Geology. Illustrated. 12mo. cloth. Philadelphia, 1864. 2 25
- ELDERHORST'S Blowpipe.—Analysis and Determinative Mineralogy. Third edition, revised. 8vo. cloth. Philadelphia, 1855. 1 50
- FAIRBAIRN.—Iron: its History, properties, and Processes of Manufacture. By Wm. Fairbairn, C. E., LL. D. 1 vol. 8vo. New Edition. 5 00
- FEUTCHWANGER.—A Treatise on Gems. 1 vol. 8vo. cloth. 1 75
- GOODYEAR'S Translation. A Treatise on the Assaying of Copper, Silver, Lead, Gold and Mercury, from the German of Th. Bodeuan and Bruno Kerl. 1 vol. 12mo. cloth. 2 50
- HUMBLE.—Dictionary of Geology and Mineralogy. 7th Edition, Revised. 1 vol. 8vo. cloth. 9 00
- HOSKOLD'S Practical Treatise on Mining Land and Railway Surveying, Engineering, Etc. 1 vol. 8vo. cloth. 16 00
- KUSTEL.—Nevada and California Processes of Silver and Gold Extraction, for general use, and especially for the Mining Public of California and Nevada; also, a description of the General Metallurgy of Silver Ores. By Guido Kustel, Mining Engineer. Illustrated by accurate engraving. 1 vol. 8vo. cloth. 5 00
- LAMBORN.—Rudimentary Treatise on the Metallurgy of Copper. 1 vol. 12mo. limp cloth. Illustrated. 1 00
- LAMBORN.—Rudimentary Treatise on the Metallurgy of Silver and Lead. 1 vol. 12mo. limp cloth. Illustrated. 1 00
- MITCHELL'S Manual of Practical Assaying. 1 vol. 8vo. cloth. 10 50
- MAKINS.—A Manual of Metallurgy, more particularly of the Precious Metals, including the Methods of Assaying them. By G. H. Makins. 1 vol. 12mo. cloth. Illustrated by upwards of 50 engravings. 3 50
- OVERMAN (Fred.)—A Treatise on Metallurgy; comprising Mining, and General and Particular Metallurgical Operations. 1 vol. 8vo. cloth. 7 50
- PIGGOT.—The Chemistry and Metallurgy of Copper. By A. Snowden Piggot, M. D. 1 vol. 12mo. cloth. 2 00
- PHILLIPS AND DARLINGTON.—Records of Mining and Metallurgy; or, Facts and Memoranda for the Use of Mine Agents and Smelters. By E. Phillips and John Darlington. 1 vol. 12mo. cloth. 4 00
- PERCY (John).—Metallurgy; the Art of Extracting Metals from their Ores, and adapting them to various Purposes of Manufacture. Iron and Steel. 1 vol. 8vo. cloth. 13 50
- PLATTNER AND MUSPRATT on the Use of the Blowpipe. 47 Diagrams. Third edition, revised. 8vo. cloth. London, 1854. 6 00
- Practical Use of the Blowpipe; being a Graduated Course of Analysis. 12mo. cloth. New York, 1855. 2 00
- SCOFFERN'S Useful Metals and their Alloys. 1 vol. cloth. 5 50
- SMITH'S Blowpipe—Vade-Mecum. The Blowpipe Characters of Minerals Alphabetically Arranged. 8vo. cloth. London, 1852. 1 75
- URE'S Dictionary of Arts, Manufactures, and Mines. 2,300 Engravings. From last London edition. 3 vols. 8vo. cloth. New York. 16 50
- WHITNEY.—A Geological Survey of California. Report of Field Work from 1850 to 1854. By J. D. Whitney. Per. vol. quarto. 6 00
- WHEELER & RANDALL'S Quartz Operator's Handbook. Flexible cloth, 12mo. San Francisco 1855. 1 00

Any of the above Books will be furnished by return mail or express, on receipt of the price with postage added. Any other books desired will also be furnished at the lowest San Francisco retail prices. Address,

**DEWEY & Co.,**  
Mining and Scientific Press Office, San Francisco.  
147 1/3 lamf

**Our Patent Agency.**  
THE PATENT AGENCY OF THE MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the Press, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

Life Insurance—The Money Drift.

EDWARDS ALTA—Sirs—I read in your issue of the 11th, a very important statistical paper, compiled by you from the Federal revenue returns, which proves the astounding fact that the distant Life Insurance Companies plying in California through "Agents," draw away nearly one million dollars per annum.

The drain under this head, as you state it, amounts to—  
Year ending 1st August, 1855.....\$465,739  
Year ending 1st August, 1856.....\$17,264  
And as we write the drain increases and must be now near a million a year—to be a million and a half next year, and so on.

And you naturally ask with surprise why this matter has not been taken in hand by some of our enterprising insurance men, so as to arrest the flight of a moiety at least of this enormous drain.

I think, sirs, your question is well put, and though my hands are full, I am yet willing to step forward and assume some of the responsibility and bear some of the preliminary expenses of forming such a Company.

When you reflect, sirs, that this million dollars a year is carried over land and sea, thousands upon thousands of miles, to places where it is lent out by distant Managers and Directors to their manufacturing and commercial friends around them, at five per cent. per annum, while our merchants and manufacturers, who are to compete with them, have to pay fifteen per cent. per annum for money [we supply them with the golden weapons to heat us] you will then conceive the magnitude of the injuries effected by the sapping and mining operations of those distant Insurance Companies. The money which must drain away, day by day, steamer after steamer, from our people, will if not stopped, impoverish this country quite as much as if it were conquered by a foreign power and held in perpetual tribute. A million a year, by compound interest, will be ten millions in five years, twenty millions in ten years, forty millions in fifteen years, eighty millions in twenty years, one hundred and sixty millions in twenty-five years, three hundred and twenty millions in thirty years! I will admit that the ordinary percentage of deaths on a business of thirty years will effect a drawback of one-third of the income, which in thirty years we will put at one hundred millions. Notwithstanding this, if we go on at our present scale of draining, we shall in thirty years lose by the Insurance operation two hundred millions of dollars! But our drain, if we don't stop it, will not stand at one million a year; it will increase year after year from one million to two millions a year, which, by my foregoing computation, would in thirty years foot up to four hundred millions! What it would amount to in sixty years I leave to other calculators. In round numbers, I should guess it would come to the full number of dollars equaling the national debt of the United States!

Now, sirs, I care not what may be said of me by critics or jealous opponents, some of whom cannot see farther than their own noses. I announce myself as ready to make an effort to stop this drain, and I hold every man who co-operates with me a benefactor of his adopted country.

Let the capital of a Local Life and Health Insurance Company be one hundred thousand dollars to begin, in shares of one hundred dollars each. I shall cheerfully take the names of co-operators in a book opened this day, in the office of the California Building and Savings Bank, California street, for that purpose.

I remain, your obedient servant,  
THOMAS MOONEY,  
Building and Savings Bank, California street.  
November 12th, 1857. 20116-4w

**MARRET STREET HOMESTEAD ASSOCIATION.**—J. S. LUTY, Secretary. Office, 305 Montgomery street, corner of Pine, San Francisco. 2v15

**BUSINESS NOTICE.**—Mr. A. T. Dewey, of this journal, contemplates a visit of several months in the Atlantic States, a portion of which time he will spend in Washington, New York and Boston. Any of our Eastern friends who wish to communicate with him, for business or other purposes, will address their letters to "Westfield, Mass."

**JACUS SREW,** Pioneer Photographer, 612 Clay street, north side, four doors above Montgomery, (late 315 Montgomery street) takes all kinds of Photographs in the best style of the Art. He would invite especial attention to the new "Cabinet Photographs," which he is taking to perfection. 10v14f

**SECRETARYSHIP FOR MINING COMPANIES.**—A gentleman of education, ability and experience, is desirous of procuring a position as Secretary, or Assistant Secretary, in some good Mining Company. Has most unexceptionable references. Address "SECRETARY," at this office. 6v15f

**Save Your Teeth.**—Do not have them extracted without first consulting a good Dentist. The loss is irreparable, and, in many instances, unnecessary. DR. BEERS, corner of Pine and Kearny streets, makes a specialty of filling the fangs of dead Teeth, and building up broken crowns with pure gold—thus restoring them to their original usefulness and beauty.

Call and examine the work. Finest quality of artificial work also manufactured. 16v14-f

**American and Foreign Patents.**—Letters Patent for Inventors can be secured in the United States and foreign countries through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past two years.

Administrator's Sale.

NOTICE IS HEREBY GIVEN, THAT IN PURSUANCE of the order of the Probate Court of the City and County of San Francisco, in the State of California, made on the twenty-first day of November, A. D. 1857, in the matter of the estate of HENRY GANAH, deceased, the undersigned, Administrator of said estate, will sell at public auction, to the highest bidder, for cash in hand, in one parcel, and subject to confirmation by said Probate Court, on MONDAY, the sixteenth day of December, A. D. 1857, at twelve o'clock M., at the auction rooms of Maurice Dore & Co., No. 327 Montgomery street, in said City and County, all the right, title, interest and estate of the said Henry Ganah, at the time of his death, and all the lot, piece or parcel of land, situate, lying and being in the said City and County, and bounded and described as follows, viz: Commencing on the southerly line of Bush street, distant 157 feet 6 inches westerly from the southwesterly corner of Bush and Hyde streets; thence running westerly on said southerly line of Bush street 137 feet 6 inches; thence at right angles southerly 137 feet 6 inches; thence at right angles easterly 137 feet 6 inches; thence at right angles northerly 137 feet 6 inches, to the southerly line of Bush street, the point of commencement, being 50-vara Lot No. 1, 367.

ANDREW T. SMITH,  
Administrator of the estate of  
Henry Ganah, deceased.  
Dated, November 21, 1857. 2v16-4w

Weekly Stock Circular.

Of Associated Brokers of the S. F. Stock and Exchange Board.

SAN FRANCISCO, SATURDAY MORNING, November 23, 1867.

City Stocks.

The transactions in city shares during the past week have been confined to a limited number of companies; however, the sales have been unusually large. San Francisco Gas stock shows an improvement, several hundred shares realizing \$66@67 per share.

Within this period under review, Spring Valley Water stock was disposed of to an unusually large extent, and under a very material decline. During the previous week no sales were effected in this Board, and on the 4th instant we have this record of 120 shares being sold at \$66, while during the present week upwards of 1,500 shares were sold within a range of \$65@60, closing at \$60 50, under an apparently better feeling.

The California Mutual Life Insurance Company was recently incorporated under the names of more than fifty of our leading moneyed citizens. The capital stock is fixed at \$100,000, together with a Guarantee Fund of \$250,000, divided into 1,000 shares of \$100 each.

We note considerable sales of Legal Tender Notes at 71 1/2 @ 71 1/4, and 71 1/4 seller 30.

Mining Share Market.

During the past week the mining share market acquired more strength, and the list exhibits considerable improvement over the transactions of the previous week. This information, as a whole, is of a favorable nature, and the indications are that a still greater advance will ensue.

CROWN POINT—advanced to \$622 50 early in the week, declined to \$590, rose to \$665, then sold at \$595, and closed yesterday at \$620. The drift on the 700-foot level—the south drift being opened 132 feet, and the north drift 142—have passed through much quartz with considerable pay ore, but the "pay" continues so scattered that it requires close sorting to obtain any margin of profit.

CHOLLAR-POTOSI—sold within a range of \$128 @138, and closed at \$131. The ore extracted during the week ending Nov. 15th, amounted to 1,636 tons, of which amount the Plute Switch Station yielded 969 tons. So far as we can judge from the present developments this amount will not be increased during the subsequent week.

HALE & NORCROSS—has been well maintained at about \$800 per foot, a few feet having sold at \$825 s 15, closing at \$800 s 30. The new shaft is now of sufficient depth to open the new station, which is 150 feet below the 780-foot level, making it the 930-foot level, and from which point they are about ready to drift.

GOULD & CUNNY—is dull, opening at \$350 seller 30, declining to \$320, and closing on Thursday at \$325. We have nothing new from this mine during this period under review.

YELLOW JACKET—exhibits a steady advance from \$380 to \$415 s 3, closing at \$407 50. An assessment of \$100 per foot was levied on the 15th instant. Our information from this mine is meagre. The shaft is nearly 200 feet in depth toward the new level, requiring about two hundred feet more before the new station will be opened.

SAVAGE—has met with largely increased sales during the past week, upwards of 3,000 feet having changed hands, opening at \$107 seller 3, advancing to \$110, receding to \$100, then selling at \$103 50, and closing at \$107 50. The amount and approximate value of this ore extracted during the past five weeks compare as follows:

Table with 3 columns: Date, Value per Ton, Total Value. Rows for November 16th, 17th, 18th, 19th, 20th, 21st, 22nd, 23rd, 24th, 25th, 26th, 27th, 28th, 29th, 30th, and October 19th.

The north mine, on the third station, produced 676 tons of this amount, and from the south mine, same level, 352 tons; the north mine, on the seventh level, yielded 410 tons. A telegram of the 22d instant states that the fourth station shows no change. The east cut from the south winze, on the third station, is said to be improving—"all ore in the fac."

IMPERIAL—has been less active, but has been well sustained, improving from \$153 to \$162, receding to \$155 buyer 3, then selling at \$159@157 50, and closing at \$162. The haulion returns from the Rock Point mill, during the current month, show a yield of \$23,033, against \$16,984 same time in October. The Gold Hill Mill, owing to repairs early in the month, has not yet reported, and the first clean-up will be in place of the second return, which is shortly expected.

KENTUCK—rose from \$132 to \$159, receded to \$147 50, and closed at \$142. The receipts of bullion by this company from the 1st to the 16th instant amounted to \$22,463, against \$24,807 same time previous month. It will, however, be remembered that the returns for October included three days of the present month.

AMADOR—was in this market at \$200 seller 30. It is believed that this haulion yield will reach \$40,000 during the present month; so far this receipts amount to \$19,500. Owing to the lessened expense during the current month, it is expected that a larger dividend will be paid the next.

GOLD HILL QUARTZ—is in better request, advancing from \$95 to \$105 seller 3, and closing at \$116. The 290-foot level continues to yield well, and from this 154-foot level a small quantity of good ore is regularly obtained. A dividend is anticipated in December. OVERMAN sold at \$44@50, and closed at \$49. The ore taken from the east drift, on the 300-foot level, is not so good as formerly.

ALPHA—sold at \$450 seller 30. EMPRE uniformly at \$175. OPHIR at \$60@64 seller 30, and closed at \$67 50. CONFIDENCE was in the market at \$35 seller 3. SIEBRA NEVADA rescinded the assessment of \$4 per share levied on the 13th instant.

The aggregate sales of Stocks, Legal Tender Notes, etc., at the regular sessions of the Board since Saturday last, amounted to \$1,090,660. The sales in the open sessions amounted to \$234,167, showing a combined aggregate to date during the past week of \$1,324,827.

NOVA SCOTIA is talking saucy, because she has been forced into the "Dominion" arrangement against her wishes. Her remonstrances not having been heeded, the papers say: "The people will see what is the next step to take?"

HENRY H. HAIGHT, Governor of California, is a native of Rochester.

SUBSCRIBERS who do not receive the Mining and Scientific Press in due time, are requested to inform the publishers.

MINING SHAREHOLDERS' DIRECTORY.

(Compiled for every issue, from advertisements in the MINING AND SCIENTIFIC PRESS and other San Francisco Journals.)

Comprising the Names of Companies, District or County, Location, Amount and date of Assessment, Date of Meeting; Day of Delinquent Sale; and Amount and Time of Payment of Dividends.

Table with columns: NAME, LOCATION, AMOUNT, AND DATE OF ASSESSMENT, DAY DELINQUENT, DAY OF SALE. Lists various mining companies and their financial details.

\*Those marked with an asterisk (\*) are advertised in this journal.

Latest Stock Prices Bid and Asked.

S. F. STOCK AND EXCHANGE BOARD.

Table with columns: MISCELLANEOUS STOCKS, Bid, Askd. Lists various stock prices including United States 7 1/2-10ths Bonds, Legat Tender Notes, California State Bonds, etc.

Table with columns: GAS COMPANIES, Bid, Askd. Lists prices for San Francisco Gas Co and Sacramento Gas Co.

Table with columns: RAILROADS, Bid, Askd. Lists prices for Sacramento Valley Railroad, San Francisco and San Jose Railroad, etc.

Table with columns: BANKING INSTITUTIONS, Bid, Askd. Lists prices for California Loan and Savings Society, Bank of California, etc.

Table with columns: INSURANCE COMPANIES, Bid, Askd. Lists prices for Fireman's Fund Insurance Co., San Francisco Insurance Co., etc.

Table with columns: MINING STOCKS—WASHOE DISTRICT, Bid, Askd. Lists prices for Alpha, Baltimore American, Belcher, Bullion, etc.

San Francisco Market Rates.

Table with columns: Wholesale Prices, Friday, Nov. 22, 1867. Lists prices for Flour, Extra, Do. Superfine, Corn Meal, etc.

Table with columns: Coffee, Costa Rica, Do. Rio, Tea, Japan, Do. Green, etc. Lists various commodity prices.

Table with columns: Retail Prices. Lists prices for Butter, California, fresh, do. pickled, etc.

San Francisco Metal Market.

PRICES FOR INVOICES.

Table with columns: Jobbing prices rule from ten to fifteen per cent. higher than the following quotations. Lists prices for Iron, Dnty, Pig, \$9 per ton, Railroad, \$8 1/2 per ton, etc.

THE BEST IN AMERICA.

The Mining and Scientific Press,

is the Largest and Best MINING AND MECHANICAL Newspaper issued in the United States.

DEWEY & CO.,

Patent Agents, Publishers, Book and Job Printers, 505 Clay Street, San Francisco.

THE MINING AND SCIENTIFIC PRESS is published every Saturday. Each issue comprises SIXTEEN PAGES (64 columns), and furnishes more valuable reading matter than any other weekly journal in California.

To the practical mechanic, metallurgist, prospector, millman, mine holder or worker, it is worth many times its subscription price. Its files contain a record of the improvements in mining machinery, the progress and development of the mines, and all new methods and processes for working and

SAVING PRECIOUS METALS.

All progressive information, in fact, transferring with the times—which cannot be obtained from books.

RESOLVED, That we regard a mining paper of journal of great importance to the mining interests of California, and recommend the MINING AND SCIENTIFIC PRESS, of San Francisco, in the consideration and support of the miners of the Pacific coast.

Terms of Subscription.—One year, \$5; six months, \$3—1/2 in advance. Send for sample copies. Remittances may be made by mail at our risk, if parties sending will register their letters, or send money order.

AS AN ADVERTISING MEDIUM throughout the whole Pacific States and Territories, the PRESS is unsurpassed. Rates moderate.

SENDING NUMBERS OF THE PRESS and Patent Circulars, free.

BEAN'S

HISTORY AND DIRECTORY

OF NEVADA COUNTY, CALIFORNIA.

Containing a complete History of the County, with Sketches of the various Towns and Mining Camps, the Names and Occupation of Residents; also, full Statistics of Mining and all other Industrial Resources.

COMPILED BY EDWIN F. BEAN.

Price, \$5—For sale at the office of the Mining and Scientific Press, San Francisco. 13v15t

Important to Californians.—Many inventors have lately had their claims for Patents seriously (and in some cases fatally) delayed by the unqualification of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations. These discrepancies, although arising from the inexperience of honest agents, are none the less dangerous to applicants for patents, whose safest course is to trust their business with none but active and experienced solicitors. The Mining and Scientific Press PATENT AGENCY has strictly complied with the requisitions of the Department, and properly filed all necessary papers as Claim Agents.

## Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

## CALIFORNIA.

## Amador County.

*Ledger*, Nov. 16th: A party of Austrians have a very rich discovery of quartz on Jackson Creek, near the Indian rancharia, about two miles above this place. They have done but little work on it, but the rock is represented as being extremely rich. One piece, about the size of a goose egg, produced \$10 in free gold.

The extensive frame for the new hoisting works at the Coney & Bigelow mine is now up, and the workmen are enclosing it. All of the machinery is expected here to-day.

The Golden Eagle will soon resume work under a new superintendent, and try the value of a different kind of amalgamating from those formerly used.

## Calaveras County.

*Mokelumne Hill Chronicle*, Nov. 16th: For the past few weeks there has been an unusual excitement in regard to quartz in this vicinity. The whole region of country hereabouts is alive with anxious seekers after leads, and in most instances the "voyages of discovery" have been crowned with success. The first check which the spreading disorder received in this vicinity, was administered by Alexander, Seavers & Co. They purchased the old Rich Gulch claim, and without making any fuss about it, erected a 10-stamp mill and commenced crushing. Our citizens looked on with arms folded. At the expiration of a few months they have paid for their machinery, all the expenses of working the mine, and have the snug little sum of \$8,000 in bank. Mokelumne Hill opened its eyes and wiggled. A short time since it transpired that a company of capitalists had purchased an extension of their lead, paying a round sum for it as it was—totally undeveloped. Mokelumne Hill shivered with excitement. Since then every quartz vein within a radius of five miles of town has been located, and work commenced in earnest. The company which purchased the extension of the Rich Gulch claim—Staples, Norton & Co.—are making preparations for the erection of a 20-stamp mill.

The name of Cat Camp has been changed to Frankfort. The reports in relation to the extent and richness of the mines are flattering in the extreme.

Prof. Blake, after visiting the mines at Angels, Murphys, West Point, and in this vicinity, says that he thinks Calaveras will yet rank among the first counties in the State for gold bearing quartz.

*San Andreas Register*, Nov. 16th: From every direction we learn of the success of miners, who have started upon veins and commenced crushing the quartz in arastras; some of them actually making money from the surface down. The success of such quartz workers as Mr. Bovee of Angels, and Dr. Southwell of Carsons, has established beyond a doubt the existence of lodes in the vicinity of these places, of the best paying character in the State. While, in the vicinity of El Dorado, West Point, Mokelumne Hill, San Antonio, Indian Creek, Railroad Flat, Murphys, Fourth-Crossing, Jenny Lind, Campo Seco, and San Andreas, the prospects are all flattering.

A correspondent at El Dorado, writes: It is evident that none believe our mines are played out, and I would not be surprised if we should do better this winter than we did last. I notice that work is being resumed on several claims, which have lain idle for two or three years.

The Mokelumne Hill Ditch Co. at Camanche, are progressing rapidly with their extension from Camp Seco, to Frankfort and Haightville; very soon there will be an abundance of water in these camps. Prospecting since the late rains has commenced in good earnest.

*Contra Costa County.*

*Gazette*, Nov. 11th: The Central Coal Co. are about resuming work. They expect to ship during the winter from 800 to 1,000 tons per month.

*Kern County.*

*Havilah Courier*, Nov. 16th: Dropping in at the Havilah Assay Office we saw three gold bricks from the St. John mine, marked Havilah—W. H. Mead—gold—fine, 684 ozs., 149.84—155.01—130.85, making 435.70 ozs., footing up in value the snug little sum of \$6,316.13. Also a gold bar from the New York Co., valued at \$1,600. The St. John bullion was from 158 tons of rock, and they have 600 tons at the dump of the same kind, with quartz enough in sight to keep them running for two years, that prospects equally as well.

## Nevada County.

*Transcript*, Nov. 14th: On Tuesday evening a big strike was made in the Buckeye claim, near the Oriental mill, on Deer Creek, and it is estimated that \$3,000 in gold was thrown out by a single blast. The Oriental mill and Buckeye mine were recently purchased by Mr. Kittz and others of San Francisco. Some 12 years ago a rich pocket was found in the ledge, but when last worked it was not a paying enterprise. The new company went to work immediately and succeeded in making this rich strike.

Nov. 15th: Yesterday a wagon passed through this place having on a boiler weighing 9,375 pounds, designed for the Grizzly mine, which is located at Devil's Canon, near the Magenta flume.

Nov. 16th: A. Hamlin, John Snyder and R. Mellin struck a rich quartz ledge in Pleasant Valley last week. The ledge was found in a ravine which empties into the creek, and on the surface decomposed rock was obtained which prospected \$2.50 to the pan. The ledge is two and a half ft. thick and the rock contains a large quantity of free gold. The parties after striking this ledge located a claim of 1,200 ft., levied an assessment of \$20 to the share, and are now sinking a shaft upon the ledge.

The Rocky Bar mines in Washington district have been impeded in work by the breaking of a ditch in the Yuba, but they have repaired damages, and there is every prospect that the rich mines in the vicinity will yield abundantly. Considerable attention is being given to quartz mining, and some fine ledges are being worked along the banks of the Yuba.

The Scandinavian Company of Pleasant Valley are getting out timbers for an 8-stamp mill, and preparing to run the tunnel. The mine looks as well as ever. Preparations are being made to work the northern extension of this mine.

Nov. 17th: A few months since a gravel mining claim, located on the Ridge, was purchased by a gentleman for \$9,000. He sold it recently for \$12,500, and after the first run of twelve days the purchaser took out \$4,500 in gold.

*Grass Valley National*, Nov. 13th: Colonel O'Connor is making preparations to erect a mill on the O'Connor lead, situate on Union Hill. A quantity of rock from the Burdett mine, Union Hill, is now being crushed at the mill of Messrs. Laton & Son.

Nov. 14th: Another lot of specimens, valued at \$500, were taken from the Dromedary ledge last night.

The new hoisting and pumping machinery of the Eureka mine is completed and ready for operation, and consists of two substantial engines of 30-horse power each, with all the latest improvements.

*Gazette*, Nov. 14th: We saw yesterday at the Union Hotel, some very rich quartz from the Buckeye ledge, situated a short distance above Willow Valley. The ledge is owned by James Kittz, and was purchased by him about two months ago, together with the Oriental mill and other property, from a New York Co. The specimens shown us yesterday are very rich, the gold being visible in every piece, and containing besides a large proportion of good-looking sulphurets. The ledge is about three feet in width, is situated at the junction of the granite and slate, and as yet has been opened to a depth of only a few feet. Mr. Kittz is now having rock taken out for crushing, and will soon test it by mill process.

*Excelsior*.—Meadow Lake *Sun*, Nov. 16th: The rock in the Kentucky mine looks splendidly. It is of the same character as that of the U. S. Grant, and fully as rich. Extensive machinery, including hoisting works and mill, will be put upon the claim in the spring. By that time the mine will be fully developed, and will, doubtless, prove as rich a gold lode as there is in the State. The mine can be cheaply worked and the ore is very rich.

Owing to the water from the surface, produced by the late storm, work was suspended on the shaft of the U. S. Grant mine for several days. As fine looking ore as can be seen in the bottom of this shaft. The mine promises to be one of the most valuable on the coast.

We saw several days ago an enormous prospect from rock taken from the Pine Tree ledge. The quartz vein is from 12 to 20 inches wide and is very rich. The claim is being prospected by a shaft which is down about 35 ft.

## Placer County.

*Dutch Flat Enquirer*, Nov. 16th: The Yuba ditch is running 1,400 inches of water at present, and three or four claims are working day and night at Cañon Creek and Gold Run.

The You Bet correspondent writes: At present there are five mills for crushing cement run by water power on Brown's Hill and Wilcox Ravine. Mr. A. Neece, of the

firm of Neece & West, at Brown's Hill, the owners of one of the richest claims on the Blue Lead, has purchased the old Cozzens & Garber steam mill and mine, on Missouri Cañon, between this place and Red Dog, for the sum of \$12,000. The old and well known Brown claims, on Wilcox Ravine, are still paying well. Mr. G. S. Brown, the present owner, has been working them constantly, night and day, taking out from \$1,500 to \$2,000, with an average expense of \$400 per week. Yesterday I was shown in this claim some of the richest cement I ever saw, and from all appearances there was plenty of it.

*Auburn Stars and Stripes*, Nov. 13th: Another ledge, or an extension of either the Green Emigrant or Black ledge, has been discovered and partially opened, between the two latter named companies. The new company is known as the North Star Co. The ledge has been sunk upon to the depth of 20 ft., at which depth they find a width of 14 in. of conglomerate similar to the Green Emigrant and Black ledges. From this, they obtain a yield of from 10 to 20 cents per pan of loose free gold, without crushing. The rock is apparently very rich. They have sent 500 lbs. below for crushing. Allowing nothing for the rock when crushed, the free, payable gold will alone make the discovery a valuable and important one. Messrs. McLaughlin & Lowery are engaged on another claim in the same neighborhood, which promises as well or better than the North Star.

The Colfax correspondent of the *Placer Herald* says: The rains within the last few days have brightened the prospects of the miners in the surface diggings in this vicinity. Several parties who have been engaged in throwing up dirt for the last six months have been able to wash some of it, and the result has been all that could be anticipated. Walker & Co. washed up the dirt that has been taken from one of their side drifts, and the average will be about \$14 per day. Dillon & Co. have disposed of their claim for \$300. Abanathy is making preparations to work his claim on an improved plan. The mines at Burnt Flat are receiving the attention of the miners in this vicinity; in fact all the surface diggings in this section of the county promise to yield from \$8 to \$20 per day to the man. The quartz prospecting is looking up. Rich discoveries have been made near the Big Hill. The Rising Sun have erected machinery on their mine and anticipate to do good work soon. The Mountain View, which has lain still for some time, is about to be prospected in a manner creditable to the owners.

*Plumas County.*

The Taylorville correspondent of the *Quincy National*, of Nov. 9th, says: Cherokee Flat, or Caledonia, is one of the liveliest places in the county. Over 100 men are at work there.

The Golden Gate, Lone Star and Bull Frog mills have stopped running for a short time. Work has also been suspended on the Cosmopolitan mine at Genesee.

## Shasta County.

*Courier*, Nov. 16th: L. Wellendorf is in possession of some very rich specimens of silver rock from the Crystal ledge. The Bullion Co. have 100 tons of rock laying at their claim. This rock is estimated to be worth from \$50 to \$75 per ton.

Several good paying claims are reported on Arbutuckle. The Parks brothers have lately erected a hydraulic apparatus on their claim and expect to take out a large amount of gold during the coming winter.

## Sierra County.

*Downieville Messenger*, Nov. 16th: We recently saw a prospect from some rock from a ledge recently discovered, called the South Fork Co., which would indicate that the rock was worth at least \$1 per lb. The ledge is situated near the lower end of Breyfogle Flat.

The Ackerly ledge is being opened with a view to erecting suitable mills for crushing the rock in the spring.

The Camptonville correspondent says that the late rain raised the river enough to sweep away every wheel and wing-dam between Goodyears' and Foster's Bar, and close river mining for this season.

## Siskiyou County.

*Yreka Union*, Nov. 9th: The Knapp claim, on the north fork of Humbung, furnishes the best indications of a permanently paying ledge of any that has yet been worked in the county. They ran a tunnel which struck the ledge about 100 ft. below where it cropped on the surface, and have taken out from between this level and the surface 300 tons of rock, which has averaged \$50 to the ton, making a total yield of \$15,000. From this tunnel they have sunk a shaft on the ledge 70 ft., making a total depth of 170 ft. from the surface. The ledge has increased regularly in size from the surface downward. Twelve or fifteen tons have been

taken from the shaft below the level of the tunnel which have yielded \$65 to the ton.

A company of Chinamen have taken out of their claim on Poor Man's Bar, Scott River, from \$800 to \$1,500 per week for the last two months. They purchased the claim about one year ago for \$2,500, and at the time there was not a white man on Scott River who would have given \$100 for it.

Mr. Coddington, the owner of the old Live Yankee quartz claim on Salmon River, near Sawyer's Bar, has several men at work prospecting the claim. The success of the Black Bear Co. is stimulating the owners of other ledges to go to work systematically to prospect them thoroughly.

The storm of Tuesday last blew down the flume of the Altona Ditch near Mugginsville.

J. J. Jones & Co., of Humbung, have sold their claim to a company of Chinamen. Report says they received \$5,000.

## Yuba County.

The *Alta* of this city speaking of the Timbuctoo mines, says: The Warren claim at Timbuctoo yields about \$200 per day when water can be obtained, using about 500 in. The Antone and Union claims adjoin, and were worked by drifting previous to 1854, and since then by piping. They sometimes have to lie idle for lack of water. McAllis & Gordon have been at work seven years, and will probably work as much longer before they exhaust their claim. The Taylor claim uses 600 in. of water and pays \$400 per day, with six men. The Michigan Co. have a large claim, and have been at work 10 or 12 years. They have paid about \$50,000 in dividends, and perhaps twice as much for water. The Babh Co. pipe about 600 in. of water, and take out sometimes as much as \$500 in a day, employing 10 to 12 men. It is said that the total yield has been \$250,000. The O'Brien claim is a large one, and it is being opened by a tunnel 160 ft. below the present outlet. The yield per day with 600 in. of water is from \$150 to \$250.

## COLORADO.

*Denver News*, Nov. 6th: Thomas Wells and F. Ricketson, just arrived from California Gulch, have several fine specimens from the Five-Twenty lode.

The First National Bank shipped this morning a bar of gold bullion, weighing 262 7/100 ozs., valued at \$6,700.

Maj. DeMary has showed us a prospect of 13 pwts. and two grs. of gold, taken from two lbs. of ore from the Five-Twenty lode. He has also several fine specimens of ore, showing free gold. The vein is between three and four ft. in width, and has been traced some 400 or 500 ft. Twelve hours sluicing have given 20 ozs. of gold. The lode is one of the richest and most promising ever discovered.

A new reduction company is being formed. It is proposed to erect the Live Yankee process. Its capital is placed at \$250,000; par value of shares \$10.

## IDAHO.

*Owyhee Avalanche*, Nov. 2d: The new ledge of Col. D. H. Fogus & Co. is yielding very rich ore. The last crushing of 16 tons gave an average of \$190 per ton. The Lincoln mill is working the ore.

The Oro Fino, North Star and Ada Elmore ledges are each paying handsomely. The three ledges employ about 100 men.

Parties returned from the new diggings on Willow Creek, between the Mulhner and Burnt river, and near Mormon Basin, say the mines are fair, but water is very scarce.

The Iowa mill in Flint is in operation, with promise of success.

*Lewiston Journal*, Oct. 31st: The placer mines are still profitably worked in Warren's Diggings.

Williams & Maxwell's new quartz mill will be ready to work.

*World*, Nov. 9th: Great activity has lately sprung up in Rocky Bar Dist., in the substitution of arastras for working rebellious ores from ledges where the mill machinery now in use is inadequate. Rock which barely paid under the mill process, is now being worked with Mexican or Chili arastras with very great success. The ore from the Golden Star ledge, which barely paid by milling process, pays richly by arastra. Within the past two months, 20 tons of ore, by the latter process, yielded over \$3,000.

At another ledge, two men have, with an arastra, averaged \$110 each per week for the last six weeks. The Fielding C. Brown arastra, worked by Mr. Hazlett, is also paying handsomely. An offer of \$1,000 was made a short time ago to Geo. Ebell, for the privilege of working some from his ledge by arastra.

Nov. 9th: The North Star mine is yielding ore of almost unexampled richness. The disputes as to its ownership are settled. A large force is employed on the mine, taking out ore enough to keep two mills at work—the Cosmos and Minear. There is considerable silver in the ore, but it is chiefly

valuable on account of its gold bearing quality. Some large pieces of the ore that were shown us were literally covered with the shining metal.

**MONTANA.**

Post, Nov. 2d: Prof. G. C. Swallow, of St. Louis, who has been stopping here during the summer, has returned to St. Louis after acquiring interests in some of the finest ledges in Flint and Highland Dist. He expects to bring out machinery in the spring to open his mine.

There is a rumor that the mill of the St. Louis & Montana Co. of Flint Creek, cleaned up lately an amount of bullion estimated at from 90 and 100 lbs., to two wagon loads of quartz.

**NEVADA.**

**Esmeralda.**

The Pine Grove correspondent of the Virginia Enterprise, of Nov. 14th, says: The Pioneer Mill Co. have finally succeeded in purchasing a major interest in the Wheeler Co's Mastodon ledge for \$10,500. The Pioneer mill has been running of late on rock from the Midas and Wilson ledges, giving large returns per ton on the ore. The last run it made was on some rock taken out of the Wheeler claim by Messrs. Clark & Goodrich which yielded \$95 per ton. There were 44 tons in that run. A short time since Capt. Todman experimented on the blue sulphuret rock, of which there is a great mass in the Wheeler mine, and has succeeded in being able to work so as to show large returns in gold from it. The arastras which formerly belonged to Emanuel Penrod, have been purchased by ex-Lieut. Gov. Crossman and Sam. Halsey, who have recently purchased a large number of tons of the Wilson ore, for which they paid Mr. Toombs \$70 per ton. The Wheeler mine which has never heretofore, to any extent, had ore extracted from it at more than one place at a time, is now having it extracted from three different places, at the rate of about four tons a day to the two laborers. This ore will average from \$50 to \$80 per ton in free gold. The croppings of the Deposit mine are being worked by Mr. Ross, who is sliding down the steep hill great cow-hides heavily laden with rich ore in saoks, taken from it. Some rock from the Wilson claim is now being worked by the Pioneer mill. It is taken from their upper tunnel, and is of very fine character. Messrs. Clark & Goodrich, who have been engaged for some time in taking rock out of the Wheeler claim on shares, giving that company one-fifth of the value of the rock for the privilege, have been doing a good thing for themselves. Their last run of 43 tons, worked by the Pioneer Co., retorted at the rate of \$95 per ton. The terms of the contract permits the contractors to take out 100 more tons, which they will proceed to do immediately. Toombs & Abraham are still working on the Wilson mine as contractors, paying Mr. Wilson a certain price per ton.

Later heads: The sale of Wheeler ground to the Pioneer Mill Co. has just been consummated.

**Humboldt.**

Unionville Register, Nov. 9th, The Pioneer mill has been undergoing repairs, whereby its capacity of reduction has been considerably increased. The mill is now kept constantly at work, day and night, on ore from the Manitowoc and Arizona ledges. The supply of ore appears to be exhaustless as the ledges are constantly improving as depth is attained.

Work on the mine in Winnemucca is progressing with most excellent prospects ahead. The French Co's new mill will soon be ready to run.

**Reese River.**

A friend writing from Belmont, under date of Nov. 5th, says: Mining in this section of the country is now assuming a more business like shape and permanence than formerly; even the poor prospector in the hills feels that his success is sure, and only a matter of time.

The famous Highbridge ledge—the Comstock of this district—is now looking magnificently, and some claim plenty of ore in sight in the Combination Co's claim to pay all the expenses of their big mill, which is being rapidly brought to completion. This will be a larger and better mill than the Gould & Curry mill at Virginia City. The Combination Co. have an immense property here in mines, ranchee, and buildings, and are doing everything on very thorough, yet economical principles.

There are many other claims, perhaps equally as good as this lode, which are not so well proved. Several new strikes have been made a few miles south of the Highbridge outcrop, that is possibly a continuation of it. The discoverers claim it is good enough, and now they cease to prospect for ledges, but will develop this for a "home stake." Again valuable mines are being developed in the Spanish belt, about seven

miles northwest of Belmont, in this same district, which are well defined and large, rich ledges.

The Belmont Co's mill is now running on very good ore, from their own mine. As yet, we have no custom mill, and of course there is not much inducement for miners to throw out their rich ore on the surface.

Hot Creek, 38 miles east of here, is growing up rapidly; and seemingly on true merits. It is showing a large bullion yield from the ore. Empire and Reveille Dist., a few miles south of Hot Creek, are also in the best of hopes, based on milling results from their ore, taken from large and numerous ledges.

Some visitors express surprise that so many good mines creates so little excitement. The multitude of them, and daily contact with so many rich ledges, tends to familiarize the people with them, and prevent excitements. Silver mining is scarcely begun in Nevada.

Reveille, Nov. 9th: The California mill, lately crushed 53 tons of ore from the Florida mine, which gave an average yield of \$379.36 per ton. The ore was of the sulphuret variety, and was well assorted.

Silver Bend Reporter, Nov. 9th: The various mines on the Spanish Belt are turning out exceedingly well. At a depth of 50 ft. the Westport discloses a ledge 12 feet in width, 5 1/2 ft. of which will average not less than \$150 to \$200 per ton by the ordinary process for working ores.

The X. L. C. R. Co. has some very rich ore at the surface; also the Pennsylvania Co. The natural facilities for working the ores of this locality are not excelled by any other in Central Nevada.

The incline upon the Belmont Co's Transylvania No. 1, has reached the water line at 153 ft. from the starting point. The ledge is 15 ft. thick, and almost entirely good ore. From the extreme surface to its lowest developed point this lode preserves a wonderful evenness and in its faultless and symmetrical beauty cannot be excelled, and challenges the admiration of all who behold it. The level now running will, when completed to the line of the claim, give the Belmont Co. a body of ore for stoping of the depth of 97 ft., of an average thickness of 10 ft., and in length nearly 600 ft.—sufficient to keep their mill in continual motion for more than a year.

The Combination Co. are now erecting steam hoisting works at their mine. The body of rich ore in the level at the water line has been found continuous as far as explored—now over 100 ft. in length along the vein—and of great width. A good portion of this ore it is estimated will yield \$500 per ton, and a large quantity of it is ready for the mill.

The pulp assay of the 3 1/2 tons of Fisherman ore, taken to the Metacom mill near Austin for reduction, was \$420 per ton. Six tons of second class ore, worked at the Hot Creek mill, yielded \$175.35 per ton. The Reveille Co. are taking out ore for the Hot Creek mill from the Mediterranean and Atlantic mines, estimated to be worth about \$150 per ton.

During the month of October there were shipped from Austin 223 bars of bullion, weighing 15,075 lbs., and valued at \$223,075.58. Of this amount \$82,449.39 were shipped by the First National Bank, and \$33,462.19 by John A. Paxton & Co.

Seven and a half tons of ore from the Diana mine, Lander Hill, lately worked at the Metacom mill, yielded the sum of \$5,579—nearly \$850 per ton. The second class ore from this mine generally yields near \$200 per ton.

Nov. 13th: The Manhattan mill is turning out 3,000 ozs. daily. Most of the ore crushed is from the North Star mine, which is wonderful both in quantity and quality.

The product of the famous Murphy mine will this month exceed that of any month since the mill was opened. Last evening eight bars, valued at \$9,000, arrived in this city, making 29 bars received so far this month. The value of these bars is about \$30,000.

The 14 tons of rock from the Northern Belle ledge, taken to the mill at Ione to be worked, yielded at the rate of \$123 per ton. Work is progressing on the Geo. Washington, Potooi and other ledges, and excellent rock obtained.

Yesterday 3,611 ozs. of crude bullion arrived from the mill of the Old Dominion Co. at Hot Creek.

Nov. 14th: At a depth of 95 ft. the workmen in the North Star mine have cut through a vein of sulphuret ore, from eight to ten inches thick, specimens of which yielded by assay \$300.

Last evening 2,500 ozs. of crude bullion arrived from Bunker Hill.

Nov. 15th: A new district named Pleasant Valley, has been discovered and organized, about 100 miles east of Austiu. The mines

were first shown to Mr. A. J. Leathers by some Goshute Indians, where a ledge was found cropping out about four ft. in width and for a length of 300 or 400 ft., showing ore throughout, and in places the ore was of extraordinary richness, containing masses of horn silver so pure and soft that a finger nail will make a bright streak upon it. The ledge was located under the name of Hidden Treasure. A quantity of ore was taken to the Centenary mill at Newark, and assays were made, going from \$1,600 to \$2,800 per ton. We learn that a ton could be easily gathered from the croppings that would be worth over \$1,000. The specimens brought to Austin were very choice, and would assay several thousand dollars per ton.

The 20-stamp mill of the Centenary Co. in Newark Dist., is now prepared to work successfully. Some 400 tons of ore are already out that will pay \$150 per ton.

A salt bed has been discovered six miles from the mill, which produce abundantly. Three hundred tons of salt were gathered which assayed 50 per cent. chlorid of sodium. A second gathering will produce 700 tons that will assay 81 per cent. Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

Enterprise, Nov. 15th: Schamp's new mill, situated in Washoe Valley, started up a day or two since. The water wheel by which it is driven is one of the largest in the State, and throughout it is in every respect as complete a mill as can be found in the country.

The Crown Point Co. are drifting in the ledge at the depth of 700 ft. from the surface, where they find a large body of quartz, the most of which is barren, although they have cut one small strata of very rich ore, showing that metal exists at that depth. Some of the specimens are almost pure black sulphurets of silver, and indicate that there is a good body of ore near at hand.

Within a few days the Yellow Jacket Co. will start a new level in the south shaft at 200 ft. greater depth than heretofore run. The design of the company is to sink 200 ft. more before they stop, which will make the Yellow Jacket the deepest mine in the State by 80 ft. The work of sinking is being prosecuted with great vigor, and before spring opens a new level will be run at a depth of 980 ft.

The total amount of bullion shipped from this city and Gold Hill for the past week was 5,747 lbs., worth \$169,830.15. The total amount of bullion received for assay at the various offices here and in Gold Hill was 77,383 ozs.

Gold Hill News, Nov. 16th: The Union G. & S. M. Co., Palmyra Dist., will sell stock on Monday the 18th, to satisfy assessments. The mine is represented as one of the best in Palmyra Dist.

**UTAH.**

Salt Lake Vedette, Nov. 5th: The Bingham Cañon gold mines are yielding from \$5 to \$8 to the day to the hand. If these mines were not situated directly under our nose we would hear a great deal more of them.

**AN INSTRUCTIVE BOOK!**

Prof. LAYRES'

**ELEMENTS OF COMPOSITION,**

**BELLES-LETTRES AND ORATORY**

For Scholars, Teachers, Lawyers all Professional Persons, and those of Common

Education, who would improve the

Eloquence and Effectiveness

of their Composition and

Manners of Address.

Price, postage paid, \$1.10

This is a new publication, and in style and treatment of this important subject, is original, simple, plain and comprehensive. The author, Prof. LAYRES (a meritorious Teacher of good standing in California, and a sound thinker and reasoner,) in his preface says: "The method pursued by the Author in developing the subject of Composition, is both the synthetical and analytical. The former is necessary to teach the theory, the latter the practice of the art; and as these are both indispensable to the scholar, so are also the two methods, as the sequel will show."

The Work has lately been approved and authorized by the State Board of Education for use in the Public Schools. To further illustrate the varied and popular endorsement the book has so rapidly received, we quote the following

**RECOMMENDATIONS:**

It is simple, concise, and well arranged. It seems to be a work of great value.—John Sneed.

I am prepared to concur in the recommendation of the Honorable Superintendent of Public Instruction.—J. C. Peltan.

After as careful and thorough perusal of the same as it was in my power to give, I came to the conclusion that, for conciseness, correctness, and precision of definition, as well as for completeness and simplicity of style, it was and would be, without a rival. I regard your work as the best of its kind. I know of but few men in any profession who would not be benefited by its careful study.—Wm. H. Hill.

I regard it as one of the best treatises upon these important branches—perhaps the only one obtainable possessing equal advantages—combining comprehensiveness with conciseness, and of such simplicity in its arrangement as to be readily understood by the advanced pupil.—F. W. Hatch.

It is admirably arranged to develop the correct ideas of the analysis and synthesis of language, and the amplification of ideas into sentences and periods. The style is clear, terse and pleasing. I do not hesitate to recommend it as a great acquisition to our text-books.—James Denman.

I am happy to express my conviction of the value of the whole treatise. It would give me much satisfaction to see so thorough and excellent a treatise emanate from young California.—Martha Kellogg.

I recommend it to all those who wish to obtain a book that will give them definite ideas on this subject, and teach them to express their thoughts and feelings in a clear, simple, and forcible manner.—Caroline L. Atwood.

I regard the book about to be published as far superior to any work extant upon that subject.—Wm. S. Hunt, A. M.

I believe the work will be a valuable and much needed addition to our school text-books.—Herman Perry.

You have brought the results of a profound analysis, and made them available, in a practical form.—I. H. Brayton.

I can recommend it particularly to my young friends of the legal profession, as a source from which they may be able to learn much of value as special pleaders and advocates at the forum.—John Curry.

The subjects upon which you treat have heretofore been too much neglected in the education of young men in America. \* \* \* Exactly calculated to interest. \* \* \* It will soon become a necessity in every lawyer's library.—Charles A. Tuttle.

Its clearness and comprehensiveness make it easy.—G. W. Bosc.

A gentleman of varied learning and ripe culture, who has half a dozen languages at his tongue's end. He seeks to teach the student not only how to take sentences apart, but how to construct them. His system has the merit of originality. We know of no work in which can be obtained so thorough an exposition of the elements of composition, and such valuable assistance in learning how to put his ideas into language. Prof. Layres has done the cause of popular education good service.—S. F. Bulletin.

This is a San Francisco book by a San Francisco author. It contains 166 pages, and is altogether creditable to San Francisco. It meets a public want, and meets it in a form and size cheap and convenient, and in reach of the humblest.—Alta-California.

The writer, the lawyer, the minister, or the statesman, may study its rules and definitions with profit. Nothing conduces more to the purity of a national literary taste than a general and thorough knowledge of the rules by which the construction of language is governed.—S. F. Times

Prof. Layres plunges at once "in medias res." He seizes a sentence (which is the unit in composition), whether written or spoken, holds it up before you; tears it to pieces before your eyes—or rather, we should say, neatly and skillfully dissects it—displays one by one its several parts; makes you thoroughly acquainted with each, in its context; and then shows you how to put them together again. A series of such experiments, increasing in complexity so gradually that you do not feel the difficulty, and the thing is done; you are master of the subject.—Mining and Scientific Press.

Its design is to show that ideas can be so arranged as to increase their power; in short, to teach the mechanism of composition, eloquence and oratory. A desideratum long felt is supplied.—S. F. Examiner.

This is an age in which the occasions are rapidly multiplying, when educated men, and women, too, are called upon to express their views in writing, either for public or private inspection and criticism.—Stockton Independent.

The most eminent educators in California give it their hearty approval, and we concur.—Marysville Appeal.

Not only one of the best of its kind, but what is still better, one of the briefest. It contains 166 pages.—Virginia Enterprise.

Price, \$1.10. Sent by mail, postage paid, without extra charge. Liberal reductions made to the Trade, Teachers and Schools, ordering by wholesale. Orders received by our Traveling Agents.

POSTMASTERS are requested to punctually inform us of the removal of subscribers of the Press from their locality, or of neglect to take the paper out of the office from any cause—when the subscriber omits that duty himself. It is not our intention to send this journal to any party longer than it is desired. If we inadvertently do so, subscribers and others will please inform us.

## Canvassing Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. Jan. 11, 1867.

Dr. L. G. Yates is our duly authorized traveling agent. July 6, 1867.

Mr. A. B. Butler is a duly authorized traveling agent for this paper. July 15, 1867.

Mr. H. C. Northrop, is our duly authorized agent for Oregon, Washington, Idaho, and Montana. Aug. 17.

## San Francisco:

Saturday Morning, Nov. 23, 1867.

## Notices to Correspondents.

**ARATOR.**—Ammonia or other nitrogenous compound appears to be less an absolute necessity for the purpose of forming a fertile soil than those of the principal mineral ingredients required by the growing plant. Experiment has distantly shown that an appreciable amount of ammonia and nitric acid becomes precipitated by rains and dews, and consequently susceptible of absorption by the leaves and roots of plants, possibly also by means of their foliage, from a humid atmosphere; but no appreciable amount of phosphoric acid, potash, etc., could be so conveyed, other than in a secondary manner—that is, by the solvent agency of the rain water upon the otherwise dormant fertile minerals composing any soil.

**A TRAVELER.**—Mining for eggs, for such literally is the case, according to Humboldt's description, occurs on the Orinoco. The missionary who accompanied this celebrated traveller and Bonpland, at this part of the river, carried a long pole and showed that by means of it the extent of the stratum of turtle eggs lying beneath their feet, could be as accurately ascertained as a miner could determine the limits of a bed of marl, of bog iron ore, or coal. He says: "Here they talked continually of square perches of eggs; it was like a mining country divided into lots, and worked with the greatest regularity." Humboldt further describes how the lieutenant or commissary divided the ground.

**FUELO.**—Chemical combination will not in many cases commence spontaneously, an elevated temperature being one of the most common excitants; for example, a bit of phosphorus will commence to burn slowly the instant it comes in contact with the atmosphere, and in hot weather will speedily burst into flame; on the other hand, a heap of charcoal may for years be similarly exposed without any alteration taking place. If, however, two or three pieces be taken, and after being made red hot are thrown upon the dry heap, chemical action will at once commence and continue until the whole mass is consumed, if measures are not adopted to prevent such a result.

**B. A.**—It has been calculated that owing to diminution of density, if indefinitely continuous, one cubic inch of air of the earth's surface would fill the entire orbit of Saturn; on the other hand, if a mine could be dug to a depth of forty-six miles, the air at the bottom would be as dense as quicksilver.

**ALCHEMIST.**—The term regulus was first employed in Alchemy, and particularly to the metallic form of antimony; the term means "the little king," as great expectations in the transmutation of metals was expected from this substance. In modern metallurgy a regulus of any other metal means a concentrated mass of metal combined with sulphur.

**ENQUIRER.**—No alkalis exist which are perfectly insoluble—many are extremely so, such as potash and soda. Others are sparingly soluble; such usually consist of the alkaline earths, such as lime and baryta.

CONTINENTAL Life Insurance Company,  
302 Montgomery street, corner of Pine.

## Iron Work for the San Francisco Dry Dock.

THE LARGEST PUMPS IN THE UNITED STATES—  
CREDIT TO SAN FRANCISCO MECHANICS.

The Vulcan Iron Works Company, of this city, have just completed the iron work on machinery for the San Francisco Dry Dock, now nearly finished, at Hunter's Point. This machinery consists of two powerful steam engines, constructed in the most substantial manner, and two enormous pumps—the largest ever built in the United States! The necessity for such heavy machinery becomes apparent when the immense size and capacity of this structure is considered—a capacity sufficient to take in the largest ships afloat, with the exception of the Great Eastern. The first ship which will go into this dock will be the British frigate *Zealous*, now on this coast. The pumps referred to are to be employed for removing the water after the ship has been floated into the dock. They are of such extraordinary dimensions that we have thought it would interest our readers to give a description of them, which has been kindly furnished us by Mr. Joseph Moore, President of the Vulcan Iron Works Company, and where we had the pleasure of making a careful examination of them a few days ago.

The engines are two in number, right and left, each having a 22-inch cylinder with 4-foot stroke, working with Myers' cut-off, adjustable to any degree of expansion and any desirable number of revolutions per minute. The pumps are driven directly from the crank shaft, by means of an upright shaft, geared by bevel pinions to each pump, set one on one side and the other on the other side of the well.

As already stated, the pumps are two in number, of the class known as centrifugal, and the most approved for this description of work. The casings are of mammoth dimensions, about ten feet in diameter, while the runner or wheel, working within them, is eight feet in diameter, having eight discharges which, when running at their proper speed of 150 revolutions, are each capable of lifting to the height of 27 feet, 2,100 cubic feet of water per minute—equal to 159,600 miner's inches, which would fill a ditch twelve feet wide and three feet deep!

The pumps are placed upon a channel plate or square suction, four feet six inches square, and weighing 30,000 pounds, which will be well fastened into the brick work, at the foot of the pump well, and separated from the dock by a huge iron gate, measuring four feet six inches in height and breadth, and worked from the surface—27 feet above the bottom. Some idea of the magnitude of this pump may be formed from the fact that the weight of the material alone, of which they are constructed, exceeds 75 tons—and this for the pumps alone, exclusive of engines and hoilers.

The hoilers to furnish the necessary steam to drive these mammoth pumps are four in number, 54 in. in diameter, 16 ft. long, and present 1,000 feet of heating surface each; yet they will consume only two tons of coal to free the dock from water, or to raise 504,000 cubic feet of water (16,150 tons) in two hours, to the height of 27 feet.

Everything connected with these pumps is made of the best material, and put together by the best workmanship on the coast—the contractors having spared neither money or care to render the work as perfect as anything of the kind ever built. The work reflects the highest credit upon the managers of the Vulcan Foundry, which institution may well feel a just pride in having been selected for the fabrication of this important and notable mass of machinery.

The entire work has been most carefully arranged for durability, efficiency, and for giving the most economical results. Few, except those practically conversant with such things, can form any adequate idea of the responsibility, difficulty and skill required in designing and getting up work of this kind, or of the constant care and watchfulness required to carry out the original designs of the engineer, through the working drawings of the draughtsman, and the complicated manipulation of the workshop, to a successful termination, so that every piece of iron, from the heaviest casting down to each individual bolt, shall be found

in its place, and fully answering the purpose intended. We shall watch, with much interest, the removal of this ponderous machinery from the shop to its place of duty, and shall take a becoming pride in recording, for the credit of our San Francisco mechanics, the success which will, without doubt, attend its first practical trial.

The above machinery was designed by Col. A. W. Von Schmidt; drawn in detail and proportioned by Mr. H. Huttner, draughtsman of the Vulcan Iron Works; superintended, in the shop, by Mr. Wm. Birch, Messrs. Von Schmidt and Thos. Hardy, are the contractors for the construction of the Dry Dock; Mr. Jas. Pollock, of the P. M. S. Co., acts as superintendent for the Dry Dock Company. The work will probably be ready for docking in about two months.

**MORE CHLORINATION WORKS.**—Mr. Mosheimer has now under contract the erection of three different Chlorination Works—one at Cold Springs, near Placerville, for Professor Pascal; another for the Havilah Mine, in El Dorado county, near Mud Springs, which will be of a capacity to work four tons of sulphurets per day; the third at the Soulshy Mine, Tuolumne county, near Sonora, to work two tons per day.

The difference of working by the chlorine process over the ordinary mode of working, may be inferred from the fact that the Washington Mine, in Mariposa, paid on a hundred tons only \$10 per ton; while the same ore, worked in Mosheimer's Chlorination Works in this city, yielded over \$100 per ton. The difference consisted in the thorough working of the sulphurets, in which the chief portion of the gold contained in the vein rock of that mine is to be found. This is, of course, an extreme case; yet there are no doubt many hundreds of mines in California, which can never be worked to a profit except by a judicious saving and treatment of the sulphurets; while there are still other hundreds whose profits might be largely increased by the same mode of working.

**VALUE OF CORN-HUSKS.**—Corn-husks are worth \$70 per ton in St. Louis, where they are used for making mattresses. This, we suppose, is for the inside husks, clear of the stalks. We should suppose that the California "soap root," being so much more durable, will be made to take the place of husks, when it becomes known there. We notice that an enterprising Boston firm has already introduced it into that city. It is sold at about half the price of curled hair, and is said to be nearly or quite as good. It is put up in the form of rope, the same as hair.

**A NEW REPEATING SHOT GUN** has been introduced here by the Roper Repeating Rifle Co., Amherst, Mass. It is well worthy of examination and trial by our sporting community. It is simple in construction, is loaded at the breech, and weighs about six and one-half pounds. It is fired four times within as many seconds, by simply cocking and discharging, and is re-charged in less time than it takes to write the fact. For charging, durable steel cartridges are used, placed in a revolving cylinder, called a carrier—a part of the barrel—and take their proper position in the act of cocking the gun. This ingenious piece of mechanism can be seen at the office of Mr. Henry Eitel, No. 111 Second street.

**COLUMBIA IRON FOUNDRY.**—This is the name given to an establishment recently opened at No. 120 Fremont street, for the manufacture of house fronts, sash-weights, and machinery castings generally, at the old stand of the Franklin Foundry. It is under the management of Mr. Reese Llewellyn, formerly of the Atlas Works, who has had many years of experience in the business, both here and in New York.

**OIL BORING** is not entirely suspended in California. The *Contra Costa Gazette* says the Messrs. Sappington are still "going down" at their well in Marsh Cañon, and "working with energy and confidence."

## Return of the Alaska Scientific Expedition.

This expedition returned to our harbor on Monday evening last, all hands in good health and much pleased with the trip, on account of its scientific and industrial results, although it was one of much toil and privation. The party left San Francisco in the revenue cutter *Lincoln*, commanded by Capt. Howard, an old and experienced veteran in the revenue service, on the 21st of July last. It was organized under the direction of Prof. Pierce, of the U. S. Coast Survey, and conducted by George Davidson, as chief; A. T. Mosman, as astronomer; Geo. Farquhar, hydrographer, with whom was associated I. Forney as aid; Dr. Albert Kellogg, hotanist; W. G. W. Harford, conchologist; T. A. Blake, geologist; John Leeds, tidal observer, and W. Hamell as engineer. The lateness of the season prevented such full results as would have followed an early start; still the main object of the expedition has been accomplished, a large amount of scientific information has been gained, and we are informed that many facts of vast industrial value will be made known to the country, when the chief, Mr. Davidson, makes his report at Washington, which he will do so soon as he arrives there—it being his purpose to go East by the next steamer.

We learn, incidentally, that the party arrived at Sitka on the 12th of August, when work really begun.

## SEARCH FOR SILVER.

Researches have been made in the neighborhood of Sitka, for reported silver deposits; but nothing was found at the localities indicated, or elsewhere.

## TIMBER, ETC.

The botany of that region was explored, so far as his limited time would admit, by Prof. Kellogg. No hard wood timber was found, of value; but a valuable species of yellow cedar was found in great abundance, and of large growth. This wood is valuable for shipbuilding, and specimens of a Russian ship were brought down, perfectly sound, although the vessel had been built 32 years, and lain upon the beach as a wreck for several years past—the wood around the iron and copper bolts was perfectly sound. This wood is also valuable for cabinet work and other purposes. Sitka spruce is also very abundant. Almost the entire country is covered with a dense growth of *sphagnum* (peat moss), into which the feet of the pedestrian sink to the depth of ten or twelve inches at every step. The moisture to support this growth is derived almost entirely from the atmosphere; hence it is not confined to swamp ground, but abounds equally as much on hill sides as in swampy places. Potatoes, turnips, etc., grow well in many places, after the *sphagnum* is removed.

The party proceeded from Sitka to Kodiack Island, some 700 miles almost due west from Sitka, and near the Peninsula of Alaska, where they found an agreeable change from universal forests to a country covered with herbage. An abundance of good pasturage exists there.

## A VALUABLE COD BANK, ETC.

Perhaps the most valuable discovery made was an extensive Cod bank, probably surpassing, in extent and value, the Banks of Newfoundland, one advantage being the fact that the water is only 50 fathoms deep, 50 miles from the shore, whereas at Newfoundland the depth is 90 fathoms, within a few miles only of the coast. There are a number of islands convenient for drying the fish. All fish heretofore caught in our northern waters have had to be brought to this city to be dried. This discovery will soon secure for this coast a large fishing fleet, which will prove, what is greatly needed, a most excellent nursery for seamen. Good bait for cod fishing was also found in great abundance in the immediate vicinity. It is estimated that there are 20,000 square miles of soundings filled with cod and halibut. Excellent whaling ground was also found.

Much geographical information was collected, which will be of especial value to commerce, etc.

## MINERALS.

With regard to minerals, large and valuable coal deposits were found, convenient to shipping points. Gold is reported by Russians on the Kakuy, a river emptying into Cook's Inlet, about latitude 60°. Copper is reported plenty on Copper River, from whence native copper is brought to the coast by the natives as an article of traffic. The miners from the Stickeen report that they are making an average of \$5 per day with a rocker.

It is said that the annual collection of furs exceeds one million of dollars in gold value.

Salmon exist in great abundance in Sitka Sound.

The official report of the expedition will be looked for with much interest.

[Written for the Mining and Scientific Press.]

The Freiberg, or Barrel Process, for the Reduction of Gold and Silver Ores.

BY PROF. ROWLANDSON, F. G. S. L.

NUMBER TWO.

SYNOPTICAL HISTORY OF AMALGAMATION.

The knowledge of the affinity which mercury possesses for combining with gold and silver, was well known at even a very early part of the historic period of man; advantage having been taken of the property to remove the golden ornamentations of worn-out apparel, by first heating the latter to ashes and then triturating the remains with mercury. Humboldt has stated that prior to the discovery of America the Germans employed mercury to extract gold from auriferous sands, and also from copper and iron pyrites.\* No account, however, exists of the employment of quicksilver for the reduction of silver ores prior to 1557, when, BARTOLOME MEDINA, a miner at Pachuca, in the neighborhood of Real-del-Monte, Mexico, first introduced the "Patio" † mode of amalgamation, by the admixture of magistral, (heated copper pyrites) salt and mercury with the ore to be beneficiated.

How this important improvement became first suggested to Medina there does not exist any record. The chemistry of the day was quite insufficient for the purpose of leading us to infer that it was arrived at by any course of inductive reasoning. The probability is that Medina dabbled in alchemy, and as salt, copper and mercury were amongst the most frequent agents employed by these pioneers of modern chemistry, it is quite probable that some tentative trial had been made with calcined copper pyrites, salt, mercury and silver ore.

Some years afterwards, (in 1586) a Peruvian miner, named Carlos Corso de Leca, introduced the method called "el beneficio de hierro," (reduction by iron) which consisted in adding to the torta ‡ small pieces of metallic iron, the object being to avoid the loss of mercury often occasioned by the peroxidation of the chloride of iron, which, when formed, rapidly converts the mercury present into a sub-chloride (calomel). If applied in sufficient quantity, and not subjected to much exposure of atmospheric influence, iron would reduce the chloride of silver, produced to the metallic condition, as rapidly as the chloride became formed, and so promote amalgamation. No accounts are to be found which would justify the conclusion that this mode of treating silver ores was either extensively adopted or continued in use for any lengthened period; it was, however, based on sound chemical reasoning, though probably, as well as the mode introduced by Medina, both were the offsprings of experiment. In whatever way the latter invention may have arisen, it forms undoubtedly the originating source of the Freiberg harrel amalgamation, in which it is well known that small fragments of iron form so important a function. I cannot dismiss the statement just made without requesting particular attention to the circumstance that it is probable that the non-success of Leca, in introducing iron into the torta, and the success of Gellert in introducing the same agent into the Freiberg harrel, are respectively due to causes the most simple; but which, in the infantine state of science at the close of the sixteenth century, was necessarily unappreciated by the original inventor. The different results alluded to, in the opinion of the writer, undoubtedly arose from the fact, that, in the torta, atmospheric influence was constantly exercising its oxygenating action on the metallic salts formed—more particularly those of iron—which, unless neutralized by precipitation, or reduced to the lowest state of oxidation by the application of additional, or the presence in the mixture of a surplusage of metallic iron, would rapidly convert no small portion of the quicksilver into calomel, as previously explained, a fact that was experienced at an early period in Washoe by many amalgamators, and still continues when the distraction of the pans do not keep pace with the acidifying influence of oxygen. In the harrel, on the contrary, the materials for amalgamation are preserved from atmospheric influence; con-

sequently, no inimical oxygenating action results. The explanation just made, which, I believe, is the first that has ever been published of the varied results which occur sometimes even when the same process has been, to a large extent, followed; the exception, principally consisting of the difference occasioned by the free access in the one case, and the exclusion of the atmosphere in the other, forms a digression from the strictly historical details. It was thought, however, that no more favorable opportunity would occur for instancing, as an example, how very much extremely slight changes of condition may effect most important, and oftentimes disappointing, results.

ALONZO BARHA'S IMPROVEMENTS

Were introduced in 1590, and are still employed, in some instances, in Mexico and, I believe, occasionally in Chili, where pretty rich ores are obtainable. The method adopted by Barha consisted in amalgamating in large copper pans, which were heated from below. I do not at present remember the exact orthography of the Spanish term which was applied to this mode, nor probably am I correct in submitting "poultice reduction" \* as a free translation into English. Barha's method occasioned a considerable saving in mercury; but the consumption of copper was great, owing not merely (as always has been assigned by former writers) in consequence of the copper reducing the chloride of silver, but chiefly by the peroxidation of the salts of iron previously noticed, which not only rapidly dissolves copper, but also possesses the property of holding in solution no inconsiderable amount of the salts of the latter named metal, which is not precipitable therefrom, even by iron, until the salts of the latter are reduced to the lowest state of oxidation. These facts are well known to those occupied in the precipitation of copper from the cupreous solution of mines, in which cases it is found that, owing to the causes assigned, the consumption of iron is usually treble, and sometimes amount to more than six times, the quantity which simple theory would assign as being required. Those desiring more proofs of the asserted fact are referred, for inquiry, to the Parys and Mona mine, in the Isle of Anglesea, North Wales, the Wicklow, in Ireland, or the Rio Tinto, in Spain. Barha's method was found to apply, with good effect, when treating native chlorides without the use of magistral, by which means the consumption of copper only amounted to thirty-two for every one hundred and eight parts of silver, which ought to be obtained according to strict theoretical proportions. As the sulphides of silver require to be converted into a chloride or metallic silver, in order to promote the action of mercury, and the consumption of copper being so great, Barha's method was never widely adopted, unless when chlorides, or ores richer than the average, were pretty abundant.

Many of the changeful phenomena just described have not unfrequently fallen under the observation of puzzled pan amalgamators, by occasionally finding their reported amalgam, when converted into a har, being composed of a larger weight of copper than anticipated, frequently derived from the sulphate of copper employed. At other times the same operators have found that a more than usual loss of mercury has taken place in either or both cases; should they occur simultaneously, the cause may safely be sought for generally in the active oxygenating influence of the atmosphere. This mode was introduced into Europe in 1784; first, I believe, into Hungary, by Baron de Born, an Austrian mining officer, and was employed in the country named, in some localities, up to a very late period. An erroneous opinion has not unfrequently gone forth that the last described method of Barha gave origin to the European improvement which next succeeded, consisting of the

BARREL OR FREIBERG METHOD OF AMALGAMATION.

It would be but an indifferent compliment to the perceptive faculties of Gellert, who introduced the harrel mode of amalgamation into Saxony in the year 1790, to attribute his success as being based on rational inferences, founded on the phenomena accompanying Barha's method.

The success of Barha's mode of beneficiation is owing to the reciprocating action which takes place between chloride of copper, formed through the medium of the chloride of sodium (common salt) present, and the sulphides of silver existing in the "poultice" or pulp; chloride of silver and sulphide of copper † being thus formed by what is termed by chemists mutual decom-

position. If this was all that occurred, the loss of copper would be but trifling, so far as the relative expense of obtaining so valuable a product as silver is concerned, which would be obtained in the theoretical proportion of only thirty-two parts, by weight of the low-priced metal, for every one hundred and eight parts of silver, which would, by this means, become susceptible of forming an amalgam with the mercury present. The large consumption of copper being caused almost wholly in consequence of the oxidizing influence of the atmosphere on the salts of iron present, and their subsequent destructive action on the interior of the enclosing copper vessel, as briefly explained previously. The destructive action would, by Barha's mode, be further intensified by the additional agency of the artificial heat applied to the bottom of the pan, a circumstance noteworthy by the pan amalgamators of the present day. In order, however, to make these phenomena better understood by the general reader, attention is drawn to the following well established facts:

It was found after the introduction of the harrel mode of amalgamation by Gellert, that the loss of quicksilver was great, owing to the cause already explained, the remedy adopted and subsequently pursued was that of turning the mixed ore, water and pieces of iron for one hour or more in the harrels prior to the introduction of the mercury. In this way, the acid salts present, formed during the roasting of the ore, became reduced to neutral and proto forms, and consequently innocuous thereafter, provided the materials during the subsequent operation were preserved from the oxygenating influence of the atmosphere, as would be the case when enclosed in air-tight harrels. Notwithstanding the practical knowledge long ago ascertained which has just been described, a lengthened period elapsed before the Washoe pan amalgamators, by "blundering luck," tumbled upon the same circumstance, and now find it advantageous to pursue a similar method, namely, to work the pans a like period prior to the introduction of the quicksilver. In this last case, the iron of the vessel and stirrers supply the place of the scrap iron used by the harrel method, at the expense, however, of the durability of the pan. In the latter case, however, acid salts are continually being formed, owing to the pulp being continuously exposed to the atmosphere, thus adding greatly to the wear of this species of apparatus. Were this not the case, a corresponding equivalent of mercury, as compared with the iron thus destroyed, would become converted into calomel. Strictly speaking, the harrel process, as originally established, combines the methods of Medina, Leca and Barha; the last, however, being an accidental occurrence, owing to the circumstance that the ores of Saxony so beneficiated, excepting the lead or what the Mexicans term "fuego ores," almost invariably contain sufficient copper to assimilate their operation somewhat to the phenomena which occurs by Barha's method. On the other hand, the Washoe pan mode assimilates to the one introduced by Leca, viz: reduction by iron, superadded to that of Medina; but which experience has shown can be considerably facilitated by the employment of sulphate of copper, which, as formerly shown, acts when converted into a chloride by the common salt present on such parts of the ore as consist of sulphides of silver.

Practically, however, the writer has never found the double decomposition of chloride of copper with sulphide of silver to fully meet the requirements of theoretical calculators, which induces him to believe that the very great loss of silver which occurs in the Washoe pan method of amalgamation, as compared with what takes place in the harrel and Barha's methods, chiefly arises from the fact that the efficacy in producing the double decomposition alluded to, is, in a large degree, dependent upon the presence of chloride of copper, greatly preponderating in mass beyond the atomic proportion of the sulphide of silver present. If this should prove on investigation to be the case, it will be easy to understand why Barha's and Gellert's modes should be very effective in reducing all the sulphides of silver found in the ore—while the Washoe pan mode is ineffective to the extent of thirty-five per cent. of the fire assay. To Gellert is undoubtedly due a very large amount of praise; first, for ingeniously adopting a rapid mode of chlorinating silver by means of roasting; second, by employing Leca's mode of afterwards dechlorinating it by means of iron, so as to be made available for amalgamating with mercury; and lastly, insuring the more complete efficiency of the process by employing utensils for the purpose, that practically, whilst in operation, they and their contents would not be under any injurious atmospheric influence.

Perry Davis' Vegetable Pain Killer.

The Pain Killer, so justly celebrated, was introduced to the public many years ago, and now enjoys a popularity unequalled by any other medicine. For the cure of diphtheria, dysentery, cholera morbus, rheumatism, coughs and colds, scalds, burns, etc., it is without an equal. Sold by all the principal druggists.—Cleveland (Ohio) Plaindealer.  
PERRY DAVIS' VEGETABLE PAIN KILLER possesses virtues which not alone remove pain instantly, but regulates the stomach, gives strength, tone and vigor to the system. It is one of those medicines which is worth more than gold.  
Prices, 25 cents, 50 cents, and \$1 per bottle.  
Sold by all Druggists, Grocers and Medicine Dealers everywhere. nov1m

## Notices to Correspondents.

**ARATOR.**—Ammonia or other nitrogenous compound appears to be less an absolute necessity for the purpose of forming a fertile soil than those of the principal mineral ingredients required by the growing plant. Experiment has distinctly shown that an appreciable amount of ammonia and nitric acid becomes precipitated by rains and dews, and consequently susceptible of absorption by the leaves and roots of plants, possibly also by means of their foliage, from a humid atmosphere; but no appreciable amount of phosphoric acid, potash, etc., could be so conveyed, other than in a secondary manner—that is, by the solvent agency of the rain water upon the otherwise dormant fertile minerals composing any soil.

**A TRAVELER.**—Mining for eggs, for each literally is the case, according to Humboldt's description, occurs on the Orinoco. The missionary who accompanied this celebrated traveller and Boupland, at this part of the river, carried a long pole and showed that by means of it the extent of the stratum of turtles eggs lying beneath their feet, could be as accurately ascertained as a miner could determine the limits of a bed of marl, of hog iron ore, or coal. He says: "Here they talked continually of square perches of eggs; it was like a mining country divided into lots, and worked with the greatest regularity." Humboldt further describes how the lieutenant or commissary divided the ground.

**FUEGO.**—Chemical combination will not in many cases commence spontaneously, an elevated temperature being one of the most common excitants; for example, a bit of phosphorus will commence to burn slowly the instant it comes in contact with the atmosphere, and in hot weather will speedily burst into flame; on the other hand, a heap of charcoal may for years be similarly exposed without any alteration taking place. If, however, two or three pieces be taken, and after being made red hot are thrown upon the dry heap, chemical action will at once commence and continue until the whole mass is consumed, if measures are not adopted to prevent such a result.

**B. A.**—It has been calculated that owing to diminution of density, if indefinitely continuous, one cubic inch of air of the earth's surface would fill the entire orbit of Saturn; on the other hand, if a mine could be dug to a depth of forty-six miles, the air at the bottom would be as dense as quicksilver.

**ALCHEMIST.**—The term regulus was first employed in Alchemy, and particularly to the metallic form of antimony; the term means "the little king," as great expectations in the transmutation of metals was expected from this substance. In modern metallurgy a regulus of any other metal means a concentrated mass of metal combined with sulphur.

**ENQUIRER.**—No alkalies exist which are perfectly insoluble—many are extremely so, such as potash and soda. Others are sparingly soluble; such usually consist of the alkaline earths, such as lime and baryta.

CONTINENTAL Life Insurance Company,  
302 Montgomery street, corner of Pine.

## Iron Work for the San Francisco Dry Dock.

THE LARGEST PUMPS IN THE UNITED STATES—

CREDIT TO SAN FRANCISCO MECHANICS.

The Vulcan Iron Works Company, of this city, have just completed the iron work and machinery for the San Francisco Dry Dock, now nearly finished, at Hunter's Point. This machinery consists of two powerful steam engines, constructed in the most substantial manner, and two enormous pumps—the largest ever built in the United States! The necessity for such heavy machinery becomes apparent when the immense size and capacity of this structure is considered—a capacity sufficient to take in the largest ships afloat, with the exception of the Great Eastern. The first ship which will go into this dock will be the British frigate *Zealous*, now on this coast. The pumps referred to are to be employed for removing the water after the ship has been floated into the dock. They are of such extraordinary dimensions that we have thought it would interest our readers to give a description of them, which has been kindly furnished us by Mr. Joseph Moore, President of the Vulcan Iron Works Company, and where we had the pleasure of making a careful examination of them a few days ago.

The engines are two in number, right and left, each having a 22-inch cylinder with 4-foot stroke, working with Myere's cut-off, adjustable to any degree of expansion and any desirable number of revolutions per minute. The pumps are driven directly from the crank shaft, by means of an upright shaft, geared by bevel pinions to each pump, set one on one side and the other on the other side of the well.

As already stated, the pumps are two in number, of the class known as centrifugal, and the most approved for this description of work. The casings are of mammoth dimensions, about ten feet in diameter, while the runner or wheel, working within them, is eight feet in diameter, having eight discharges which, when running at their proper speed of 150 revolutions, are each capable of lifting to the height of 27 feet, 2,100 cubic feet of water per minute—equal to 159,600 miner's inches, which would fill a ditch twelve feet wide and three feet deep!

The pumps are placed upon a channel plate or square suction, four feet six inches square, and weighing 30,000 pounds, which will be well fastened into the brick work, at the foot of the pump well, and separated from the dock by a huge iron gate, measuring four feet six inches in height and breadth, and worked from the surface—27 feet above the bottom. Some idea of the magnitude of this pump may be formed from the fact that the weight of the material alone, of which they are constructed, exceeds 75 tons—and this for the pumps alone, exclusive of engines and boilers.

The boilers to furnish the necessary steam to drive these mammoth pumps are four in number, 54 in. in diameter, 16 ft. long, and present 1,000 feet of heating surface each; yet they will consume only two tons of coal to free the dock from water, or to raise 504,000 cubic feet of water (16,150 tons) in two hours, to the height of 27 feet.

Everything connected with these pumps is made of the best material, and put together by the best workmanship on the coast—the contractors having spared neither money or care to render the work as perfect as anything of the kind ever built. The work reflects the highest credit upon the managers of the Vulcan Foundry, which institution may well feel a just pride in having been selected for the fabrication of this important and notable mass of machinery.

The entire work has been most carefully arranged for durability, efficiency, and for giving the most economical results. Few, except those practically conversant with such things, can form any adequate idea of the responsibility, difficulty and skill required in designing and getting up work of this kind, or of the constant care and watchfulness required to carry out the original designs of the engineer, through the working drawings of the draughtsman, and the complicated manipulation of the workshop, to a successful termination, so that every piece of iron, from the heaviest casting down to each individual bolt, shall be found

in its place, and fully answering the purpose intended. We shall watch, with much interest, the removal of this ponderous machinery from the shop to its place of duty, and shall take a becoming pride in recording, for the credit of our San Francisco mechanics, the success which will, without doubt, attend its first practical trial.

The above machinery was designed by Col. A. W. Von Schmidt; drawn in detail and proportioned by Mr. H. Huttner, draughtsman of the Vulcan Iron Works; superintended, in the shop, by Mr. Wm. Birch, Messrs. Von Schmidt and Thos. Hardy, are the contractors for the construction of the Dry Dock; Mr. Jas. Pollock, of the P. M. S. Co., acts as superintendent for the Dry Dock Company. The work will probably be ready for docking in about two months.

**MORE CHLORINATION WORKS.**—Mr. Mosheimer has now under contract the erection of three different Chlorination Works—one at Cold Springs, near Placerville, for Professor Pascal; another for the Havilah Mine, in El Dorado county, near Mud Springs, which will be of a capacity to work four tons of sulphurets per day; the third at the Soulsby Mine, Toulumne county, near Sonora, to work two tons per day.

The difference of working by the chlorine process over the ordinary mode of working, may be inferred from the fact that the Washington Mine, in Mariposa, paid on a hundred tons only \$10 per ton; while the same ore, worked in Mosheimer's Chlorination Works in this city, yielded over \$100 per ton. The difference consisted in the thorough working of the sulphurets, in which the chief portion of the gold contained in the vein rock of that mine is to be found. This is, of course, an extreme case; yet there are no doubt many hundreds of mines in California, which can never be worked to a profit except by a judicious saving and treatment of the sulphurets; while there are still other hundreds whose profits might be largely increased by the same mode of working.

**VALUE OF CORN-HUSKS.**—Corn-husks are worth \$70 per ton in St. Louis, where they are used for making mattresses. This, we suppose, is for the inside husks, clear of the stalks. We should suppose that the California "soap root," being so much more durable, will be made to take the place of husks, when it becomes known there. We notice that an enterprising Boston firm has already introduced it into that city. It is sold at about half the price of curled hair, and is said to be nearly or quite as good. It is put up in the form of rope, the same as hair.

**A NEW REPEATING SHOT GUN** has been introduced here by the Roper Repeating Rifle Co., Amherst, Mass. It is well worthy of examination and trial by our sporting community. It is simple in construction, is loaded at the breech, and weighs about six and one-half pounds. It is fired four times within as many seconds, by simply cocking and discharging, and is re-charged in less time than it takes to write the fact. For charging, durable steel cartridges are used, placed in a revolving cylinder, called a carrier—a part of the barrel—and take their proper position in the act of cocking the gun. This ingenious piece of mechanism can be seen at the office of Mr. Henry Eitel, No. 111 Second street.

**COLUMBIA IRON FOUNDRY.**—This is the name given to an establishment recently opened at No. 120 Fremont street, for the manufacture of house fronts, sash-weights, and machinery castings generally, at the old stand of the Franklin Foundry. It is under the management of Mr. Reese Llewellyn, formerly of the Atlas Works, who has had many years of experience in the business, both here and in New York.

**OIL BORING** is not entirely suspended in California. The *Contra Costa Gazette* says the Messrs. Sappington are still "going down" at their well in Marsh Cañon, and "working with energy and confidence."

## Return of the Alaska Scientific Expedition.

This expedition returned to our harbor on Monday evening last, all hands in good health and much pleased with the trip, on account of its scientific and industrial results, although it was one of much toil and privation. The party left San Francisco in the revenue cutter *Lincoln*, commanded by Capt. Howard, an old and experienced veteran in the revenue service, on the 21st of July last. It was organized under the direction of Prof. Pierce, of the U. S. Coast Survey, and conducted by George Davidson, as chief; A. T. Mosman, as astronomer; Geo. Farquhar, hydrographer, with whom was associated I. Forney as aid; Dr. Albert Kellogg, hotanist; W. G. W. Harford, conchologist; T. A. Blake, geologist; John Leeds, tidal observer, and W. Hamell as engineer. The lateness of the season prevented such full results as would have followed an early start; still the main object of the expedition has been accomplished, a large amount of scientific information has been gained, and we are informed that many facts of vast industrial value will be made known to the country, when the chief, Mr. Davidson, makes his report at Washington, which he will do so soon as he arrives there—it being his purpose to go East by the next steamer.

We learn, incidentally, that the party arrived at Sitka on the 12th of August, when work really began.

## SEARCH FOR SILVER.

Researches have been made in the neighborhood of Sitka, for reported silver deposits; but nothing was found at the localities indicated, or elsewhere.

## TIMBER, ETC.

The botany of that region was explored, so far as his limited time would admit, by Prof. Kellogg. No hard wood timber was found, of value; but a valuable species of yellow cedar was found in great abundance, and of large growth. This wood is valuable for shipbuilding, and specimens of a Russian ship were brought down, perfectly sound, although the vessel had been built 32 years, and lain upon the beach as a wreck for several years past—the wood around the iron and copper bolts was perfectly sound. This wood is also valuable for cabinet work and other purposes. Sitka spruce is also very abundant. Almost the entire country is covered with a dense growth of *sphagnum* (peat moss), into which the feet of the pedestrian sink to the depth of ten or twelve inches at every step. The moisture to support this growth is derived almost entirely from the atmosphere; hence it is not confined to swamp ground, but abounds equally as much on hill sides as in swampy places. Potatoes, turnips, etc., grow well in many places, after the *sphagnum* is removed.

The party proceeded from Sitka to Kodiack Island, some 700 miles almost due west from Sitka, and near the Peninsula of Alaska, where they found an agreeable change from universal forests to a country covered with herbage. An abundance of good pasturage exists there.

## A VALUABLE COD BANK, ETC.

Perhaps the most valuable discovery made was an extensive Cod bank, probably surpassing, in extent and value, the Banks of Newfoundland, one advantage being the fact that the water is only 50 fathoms deep, 50 miles from the shore, whereas at Newfoundland the depth is 90 fathoms, within a few miles only of the coast. There are a number of islands convenient for drying the fish. All fish heretofore caught in our northern waters have had to be brought to this city to be dried. This discovery will soon secure for this coast a large fishing fleet, which will prove, what is greatly needed, a most excellent nursery for seamen. Good bait for cod fishing was also found in great abundance in the immediate vicinity. It is estimated that there are 20,000 square miles of soundings filled with cod and halibut. Excellent whaling ground was also found.

Much geographical information was collected, which will be of especial value to commerce, etc.

## MINERALS.

With regard to minerals, large and valuable coal deposits were found, convenient to shipping points. Gold is reported by Rueians on the Kakuy, a river emptying into Cook's Inlet, about latitude 60°. Copper is reported plenty on Copper River, from whence native copper is brought to the coast by the natives as an article of traffic. The miners from the Stickeen report that they are making an average of \$5 per day with a rocker.

It is said that the annual collection of furs exceeds one million of dollars in gold value.

Salmon exist in great abundance in Sitka Sound.

The official report of the expedition will be looked for with much interest.

[Written for the Mining and Scientific Press.]

The Freiberg, or Barrel Process, for the Reduction of Gold and Silver Ores.

BY PROF. ROWLANDSON, F. G. S. L.

NUMBER TWO.

SYNOPTICAL HISTORY OF AMALGAMATION.

The knowledge of the affinity which mercury possesses for combining with gold and silver, was well known at even a very early part of the historic period of man; advantage having been taken of the property to remove the golden ornamentations of worn-out apparel, by first burning the latter to ashes and then triturating the remains with mercury. Humboldt has stated that prior to the discovery of America the Germans employed mercury to extract gold from auriferous sands, and also from copper and iron pyrites.\* No account, however, exists of the employment of quicksilver for the reduction of silver ores prior to 1557, when, BARTOLOME MEDINA, a miner at Paebuca, in the neighborhood of Real-del-Monte, Mexico, first introduced the "Patio" † mode of amalgamation, by the admixture of magistral, (burned copper pyrites) salt and mercury with the ore to be benefited.

How this important improvement became first suggested to Medina there does not exist any record. The chemistry of the day was quite insufficient for the purpose of leading us to infer that it was arrived at by any course of inductive reasoning. The probability is that Medina dabbled in alchemy, and as salt, copper and mercury were amongst the most frequent agents employed by these pioneers of modern chemistry, it is quite probable that some tentative trial had been made with calcined copper pyrites, salt, mercury and silver ore.

Some years afterwards, (in 1586) a Peruvian miner, named Carlos Corso de Leca, introduced the method called "el beneficio de hierro," (reduction by iron) which consisted in adding to the torta ‡ small pieces of metallic iron, the object being to avoid the loss of mercury often occasioned by the peroxidation of the chloride of iron, which, when formed, rapidly converts the mercury present into a sub-chloride (calomel). If applied in sufficient quantity, and not subjected to much exposure of atmospheric influence, iron would reduce the chloride of silver, produced to the metallic condition, as rapidly as the chloride became formed, and so promote amalgamation. No accounts are to be found which would justify the conclusion that this mode of treating silver ores was either extensively adopted or continued in use for any lengthened period; it was, however, based on sound chemical reasoning, though probably, as well as the mode introduced by Medina, both were the offsprings of experiment. In whatever way the latter invention may have arisen, it forms undoubtedly the originating source of the Freiberg barrel amalgamation, in which it is well known that small fragments of iron form so important a function. I cannot dismiss the statement just made without requesting particular attention to the circumstance that it is probable that the non-success of Leca, in introducing iron into the torta, and the success of Gellert in introducing the same agent into the Freiberg barrel, are respectively due to causes the most simple; but which, in the infantine state of science at the close of the sixteenth century, was necessarily unappreciated by the original inventor. The different results alluded to, in the opinion of the writer, undoubtedly arose from the fact, that, in the torta, atmospheric influence was constantly exercising its oxygenating action on the metallic salts formed—more particularly those of iron—which, unless neutralized by precipitation, or reduced to the lowest state of oxidation by the application of additional, or the presence in the mixture of a surplusage of metallic iron, would rapidly convert no small portion of the quicksilver into calomel, as previously explained, a fact that was experienced at an early period in Washoe by many amalgamators, and still continues when the distraction of the pans do not keep pace with the acidifying influence of oxygen. In the barrel, on the contrary, the materials for amalgamation are preserved from atmospheric influence; con-

sequently, no inimical oxygenating action results. The explanation just made, which, I believe, is the first that has ever been published of the varied results which occur sometimes even when the same process has been, to a large extent, followed; the exception, principally consisting of the difference occasioned by the free access in the one case, and the exclusion of the atmosphere in the other, forms a digression from the strictly historical details. It was thought, however, that no more favorable opportunity would occur for instancing, as an example, how very much extremely slight changes of condition may effect most important, and oftentimes disappointing, results.

ALONZO BARBA'S IMPROVEMENTS

Were introduced in 1590, and are still employed, in some instances, in Mexico and, I believe, occasionally in Chili, where pretty rich ores are obtainable. The method adopted by Barba consisted in amalgamating in large copper pans, which were beaten from below. I do not at present remember the exact orthography of the Spanish term which was applied to this mode, nor probably am I correct in submitting "poultice reduction" \* as a free translation into English. Barba's method occasioned a considerable saving in mercury; but the consumption of copper was great, owing not merely (as always has been assigned by former writers) in consequence of the copper reducing the chloride of silver, but chiefly by the peroxidation of the salts of iron previously noticed, which not only rapidly dissolved copper, but also possesses the property of holding in solution no inconsiderable amount of the salts of the latter named metal, which is not precipitable therefrom, even by iron, until the salts of the latter are reduced to the lowest state of oxidation. These facts are well known to those occupied in the precipitation of copper from the cupreous solution of mines, in which cases it is found that, owing to the causes assigned, the consumption of iron is usually treble, and sometimes amount to more than six times, the quantity which simple theory would assign as being required. Those desiring more proofs of the asserted fact are referred, for inquiry, to the Parje and Mona mine, in the Isle of Anglesea, North Wales, the Wicklow, in Ireland, or the Rio Tinto, in Spain. Barba's method was found to apply, with good effect, when treating native chlorides without the use of magistral, by which means the consumption of copper only amounted to thirty-two for every one hundred and eight parts of silver, which ought to be obtained according to strict theoretical proportions. As the sulphides of silver require to be converted into a chloride or metallic silver, in order to promote the action of mercury, and the consumption of copper being so great, Barba's method was never widely adopted, unless when chlorides, or ores richer than the average, were pretty abundant.

Many of the changeful phenomena just described have not infrequently fallen under the observation of puzzled pan amalgamators, by occasionally finding their retorted amalgam, when converted into a bar, being composed of a larger weight of copper than anticipated, frequently derived from the sulphate of copper employed. At other times the same operators have found that a more than usual loss of mercury has taken place in either or both cases; should they occur simultaneously, the cause may safely be sought for generally in the active oxygenating influence of the atmosphere. This mode was introduced into Europe in 1784; first, I believe, into Hungary, by Baron de Born, an Austrian mining officer, and was employed in the country named, in some localities, up to a very late period. An erroneous opinion has not infrequently gone forth that the last described method of Barba gave origin to the European improvement which next succeeded, consisting of the

BARREL OR FREIBERG METHOD OF AMALGAMATION.

It would be but an indifferent compliment to the perceptive faculties of Gellert, who introduced the barrel mode of amalgamation into Saxony in the year 1790, to attribute his success as being based on rational inferences, founded on the phenomena accompanying Barba's method.

The success of Barba's mode of beneficiation is owing to the reciprocating action which takes place between chloride of copper, formed through the medium of the chloride of sodium (common salt) present, and the sulphides of silver existing in the "poultice" or pulp; chloride of silver and sulphide of copper † being thus formed by what is termed by chemists mutual decom-

position. If this was all that occurred, the loss of copper would be but trifling, so far as the relative expense of obtaining so valuable a product as silver is concerned, which would be obtained in the theoretical proportion of only thirty-two parts, by weight of the low-priced metal, for every one hundred and eight parts of silver, which would, by this means, become susceptible of forming an amalgam with the mercury present. The large consumption of copper being caused almost wholly in consequence of the oxidizing influence of the atmosphere on the salts of iron present, and their subsequent destructive action on the interior of the enclosing copper vessel, as briefly explained previously. The destructive action would, by Barba's mode, be further intensified by the additional agency of the artificial heat applied to the bottom of the pan, a circumstance noteworthy by the pan amalgamators of the present day. In order, however, to make these phenomena better understood by the general reader, attention is drawn to the following well established facts:

It was found after the introduction of the barrel mode of amalgamation by Gellert, that the loss of quicksilver was great, owing to the cause already explained, the remedy adopted and subsequently pursued was that of turning the mixed ore, water and pieces of iron for one hour or more in the barrels prior to the introduction of the mercury. In this way, the acid salts present, formed during the roasting of the ore, became reduced to neutral and proto forms, and consequently innocuous thereafter, provided the materials during the subsequent operation were preserved from the oxygenating influence of the atmosphere, as would be the case when enclosed in air-tight barrels. Notwithstanding the practical knowledge long ago ascertained which has just been described, a lengthened period elapsed before the Washoe pan amalgamators, by "blundering luck," tumbled upon the same circumstance, and now find it advantageous to pursue a similar method, namely, to work the pans a like period prior to the introduction of the quicksilver. In this last case, the iron of the vessel and stirrers supply the place of the scrap iron used by the barrel method, at the expense, however, of the durability of the pan. In the latter case, however, acid salts are continually being formed, owing to the pulp being continuously exposed to the atmosphere, thus adding greatly to the wear of this species of apparatus. Were this not the case, a corresponding equivalent of mercury, as compared with the iron thus destroyed, would become converted into calomel. Strictly speaking, the barrel process, as originally established, combines the methods of Medina, Leca and Barba; the last, however, being an accidental occurrence, owing to the circumstance that the ores of Saxony so benefited, excepting the lead or what the Mexicans term "fuego ores," almost invariably contain sufficient copper to assimilate their operation somewhat to the phenomena which occurs by Barba's method. On the other hand, the Washoe pan mode assimilates to the one introduced by Leca, viz: reduction by iron, superadded to that of Medina; but which experience has shown can be considerably facilitated by the employment of sulphate of copper, which, as formerly shown, acts when converted into a chloride by the common salt present on such parts of the ore as consist of sulphides of silver.

Practically, however, the writer has never found the double decomposition of chloride of copper with sulphide of silver to fully meet the requirements of theoretical calculators, which induces him to believe that the very great loss of silver which occurs in the Washoe pan method of amalgamation, as compared with what takes place in the barrel and Barba's methods, chiefly arises from the fact that the efficacy in producing the double decomposition alluded to, is, in a large degree, dependent upon the presence of chloride of copper, greatly preponderating in mass beyond the atomic proportion of the sulphide of silver present. If this should prove on investigation to be the case, it will be easy to understand why Barba's and Gellert's modes should be very effective in reducing all the sulphides of silver found in the ore—while the Washoe pan mode is ineffective to the extent of thirty-five per cent. of the fire assay. To Gellert is undoubtedly due a very large amount of praise; first, for ingeniously adopting a rapid mode of chlorinating silver by means of roasting; second, by employing Leca's mode of afterwards dechlorinating it by means of iron, so as to be made available for amalgamating with mercury; and lastly, insuring the more complete efficiency of the process by employing utensils for the purpose, that practically, whilst in operation, they and their contents would not be under any injurious atmospheric influence.

\* It is unfortunate that this celebrated philosopher did not give, possibly from inability, the ratio of gold extracted from these latter.

† From the Spanish word signifying a court or open space.

‡ An abbreviation of "torrado," a kind of large pie.

\* So termed, probably, because the mixture in the copper pan had the appearance and consistency of the preparation for making an ordinary poultice; the more elegant term, pulp, has been adopted for a similar mixture at Washoe.

† On this fact is based the employment of sulphate of copper in pan amalgamation.

Perry Davis' Vegetable Pain Killer.

The Pain Killer, so justly celebrated, was introduced to the public many years ago, and now enjoys a popularity unequalled by any other medicine. For the cure of diphtheria, dysentery, cholera morbus, rheumatism, coughs and colds, scalds, burns, etc., it is without an equal. Sold by all the principal druggists.—Cleveland (Ohio) Plaindealer.

PERRY DAVIS' VEGETABLE PAIN KILLER possesses virtues which not alone remove pain instantly, but regulates the stomach, gives strength, tone and vigor to the system. It is one of those medicines which is worth more than gold. Prices, 25 cents, 50 cents, and \$1 per bottle.

Sold by all Druggists, Grocers and Medicine Dealers everywhere. nov1m

ELECTROTYPING CUTS, ENGRAVINGS, ETC.—Our Job Printing Office is abundantly supplied with elegant engravings, ornaments and other embellishments to suit the various branches of industry in this State.

**THE RODMAN GUN.**—An English paper, speaking of the successful trial of the Rodman gun, (American) says: "The fifteen-inch Rodman has really penetrated the eight-inch target at Shoeburyness. There need be no longer any dispute as to the quality of the powder nor the amount of the charge. The smash was tremendous, and so was the noise. The roar of the huge gun 'made the earth tremble.' Two masses of armor plate, each weighing about six hundred weight, were tossed some twenty yards or more to the rear of the target, and a shower of 'smaller' pieces lay scattered upon the ground. A massive timber sheet was dashed into splinters, and three others were injured. On the inner skin of the target a piece was carried away, which is described as being of the size of an ordinary tea tray. A second shot was even more triumphant than the first, seeing that it struck the target in a stronger place, being, in fact, the soundest part of the structure."

No other gun has ever been able to penetrate that target.

In Florida, peaches will not grow. Where peaches end, oranges commence.

**Rates of Postage on Printed Matter to Europe and Asia.**

The Post Office Department has made arrangements by which a number of European and Asiatic countries, hitherto beyond the reach of our mail communication except by letter, are brought within the range of delivery of all, or nearly all, United States mail matter. It is a singular fact, unknown probably to most persons who have not occasion to learn it by unpleasant experience, that there was a considerable region in the civilized world where an American traveler might not receive a newspaper directly from home.  
Under the arrangement now completed, prepayment of postage (sometimes at high rates), is made necessary in all cases. The following official statement gives a full list of the countries—with some of which there has been regular communication—that are now included in the delivery by way of Hamburg and Bremen:  
Rates of postage on newspapers and other printed matter (periodicals, etc.) sent from the United States to countries in Europe and Asia, by Bremen or Hamburg mail—prepayment compulsory:

**NEWSPAPERS—MARKED AS FOLLOWS:**  
Bremen, by Bremen mail—2 cents each.  
Hamburg, by Hamburg mail—2 cents each.  
Prussia, Austria and German States, by Bremen and Hamburg mail—3 cents each.  
Luneburg, by Bremen mail—3 cents each.  
Luneburg, by Hamburg mail—3 cents each and 1 cent per 1/2 ounce.  
Schleswig-Holstein and Denmark, by Bremen or Hamburg mail—3 cents each and 1 cent per 1/2 ounce.  
Sweden, by Bremen or Hamburg—3 cents each, and 1/2 cent per 1/2 ounce.  
Norway, by Bremen or Hamburg—3 cents each, and 3/4 cents per 1/2 ounce.  
Holland, by Bremen or Hamburg—3 cents each, and 1 cent per 1/2 ounce.  
Russia, by Bremen or Hamburg—3 cents each, and 1 cent per 1/2 ounce.  
Switzerland, by Bremen or Hamburg—4 cents each.  
Italy, by Bremen or Hamburg—5 cents each.  
Turkey, by Bremen or Hamburg—3 cents each, and 5/8 cents per 1/2 ounce.  
Greece, by Bremen or Hamburg—3 cents each, and 5/8 cents per 1/2 ounce.  
Gibraltar, Spain and Portugal, by Bremen or Hamburg—3 cents each, and 2/8 cents per 1/2 ounce.  
Austria, India and China, by Bremen or Hamburg mail via Marseilles—3 cents each, and 9 cents per 1/2 ounce.  
Austria, India and China, by Bremen and Hamburg mails, via Trieste—8 cents each, and 2 cents per 1/2 ounce.

**PERIODICALS, ETC.**  
Bremen, by Bremen mail—1 cent per ounce.  
Hamburg, by Hamburg mail—1 cent per ounce.  
Prussia, Austria and German States, by Bremen or Hamburg—1 1/2 cent per ounce.  
Luneburg, by Bremen mail—1 1/2 cent per ounce.  
Luneburg, by Hamburg mail—1 1/2 cent per ounce, and 1/2 cent per 1/2 ounce.  
Schleswig-Holstein and Denmark, by Bremen or Hamburg—1 1/2 cent per ounce and 1/2 cent per 1/2 ounce.  
Sweden, by Bremen or Hamburg—1 1/2 cent per ounce, and 2 cents per 1/2 ounce.  
Norway, by Bremen or Hamburg—1 1/2 cent per ounce, and 4 cents per 1/2 ounce.  
Holland, by Bremen or Hamburg—1 1/2 cent per ounce, and 1 1/2 cent per 1/2 ounce.  
Russia, by Bremen or Hamburg—1 1/2 cent per ounce, and 1 1/2 cent per 1/2 ounce.  
Switzerland, by Bremen or Hamburg—1 1/2 cent per ounce, and 1 cent per 1/2 ounce.  
Italy, by Bremen or Hamburg—1 1/2 cent per ounce, and 2 cents per 1/2 ounce.  
Turkey, by Bremen or Hamburg—1 1/2 cent per ounce, and 5/8 cents per 1/2 ounce.  
Greece, by Bremen or Hamburg—1 1/2 cent per ounce, and 5/8 cents per 1/2 ounce.  
Gibraltar, Spain and Portugal, by Bremen or Hamburg—1 1/2 cent per ounce, and 2 1/2 cents per 1/2 ounce.  
Austria, India and China, by Bremen or Hamburg mail, by way of Marseilles—1 1/2 cent per ounce, and 9 cents per 1/2 ounce.  
Austria, India and China, by Bremen or Hamburg mail, by way of Trieste—6 1/2 cents per ounce, and 2 cents per 1/2 ounce.  
These charges are in each case in full to destination, combining rates between the United States and Bremen or Hamburg, and the rate beyond Bremen and Hamburg to points of delivery.

Important to Californians.—Many inventors have lately had their claims for Patents seriously and in some cases fatally delayed by the unqualification of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations. These discrepancies, although arising from the inexperience of honest agents are none the less dangerous to applicants for patents, whose safest course is to trust their business with none but active and experienced solicitors. The Mining and Scientific Press Patent Agency has strictly complied with the requisitions of the Department, and properly filed all necessary papers as Claim Agents.

**FIRST Paint Manufactory IN CALIFORNIA.**

**EPES & E. H. R. ELLERY**  
Have the Patent Right for the Pacific Coast to manufacture, sell and use

**Ellery's Patent India Rubber Cement & Paint.**  
It is for all exposed surfaces; impervious to wet; will not rot, peel, blister or crack, in any climate. A superior Paint for brick, wood, cloth, metals, etc.; successfully used in the Eastern States. The old iron roof of that large building, the New York Race Mills, was in such bad condition it was about to be taken off ten years since. Instead, they put on the INDIA RUBBER CEMENT AND PAINT making a good tight roof. A coat of India Rubber Paint every two years since keeps it in good condition. We can refer to many others. The Atlantic Lead Works use our Paint only.

**NEW CLOTH ROOFS** put on copious and all seams cemented and saturated, then coated with the India Rubber Cement and Paint—the same as on the St. Nicholas Hotel at New York City, the City Buildings and many others. The roofs of all the houses and steam cars, decks of steamboats, etc., around New York—for eight dollars per one hundred square feet. **NEW OR OLD TIN ROOFS** cemented and painted with the India Rubber Cement and Paint guaranteed at from one cent to two and a half cents per square foot, according to size and condition of roof. Good men and the best materials used.

We have just cemented and painted old tin roofs of Dr. H. B. Cogswell, Tibbs & Co., D. J. Oliver, etc., and the wood work of Sheriff Davis' building, 88 feet front, on Folsom street, between Third and Fourth streets—only one cent. The work will speak for itself. Now painting the cornice and iron work of Dr. H. D. Cogswell's building, corner of Front and Clark streets—one cent. See the above and further references at our office.

**ELLERY'S PATENT INDIA RUBBER CEMENT AND PAINT** is composed of India rubber and other gums, dissolved in linseed oil, mixed with the various coloring matters and ground in any color. When applied to roofs or other purposes, it is mixed with pure linseed oil to the required thickness, and put on as other paints are, with a paint brush—retaining sufficient elasticity to give and take with the heat and cold. Fifteen hundred fishing vessels at Cape Ann use the India Rubber Paint, finding it superior to all others.

**EPES & E. H. R. ELLERY** are now prepared to make good roofs, and cement and paint new or old ones, and do all kinds of outside painting with Ellery's Patent India Rubber Paint. No asphaltum or coal tar used.  
Office, No. 226 Jackson street, corner Battery, San Francisco, Cal. 6v15

THE GOLDEN ERA. Founded in 1852, it is the oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a literary and Family journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent.

THE GOLDEN ERA Is the most universally popular of all the Weekly journals. It presents forty-eight columns, containing the greatest possible variety of valuable and entertaining, Original and Selected matter. It is a welcome guest in Cottage and Cabin; the favorite at the fireside in city and country; the most useful, agreeable and altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe and elsewhere. Every household in the mountains and valleys, the cities, towns and mining camps of California, and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor. Inspired with the genius of the age, it is progressive, and aims not so much at distinction as a newspaper, as at honorable success in its capacity of a great Moralizing and Improving Influence, Exercising a positive power for good, and wielding a permanent influence, many able and eminent writers choose its columns as a means of communicating with the public. No effort will be spared to make it a thoroughly California newspaper, and worthy of the support of all classes of our citizens.

Rates of Subscription: (Invariably in advance.) One year.....\$5.00 Six months.....\$3.00 Three months.....\$2.00 TERMS TO CLUBS: Three copies one year.....\$12.00 Five copies one year..... 18.00 Ten copies one year..... 35.00 An extra copy free for one year to the person sending a club of ten subscribers. Send money to our office in registered letter, or by Express, Address, BROOKS & CAPP, San Francisco. 11v15

All About Sending Money by Mail.

RATES OF COMMISSION.—The following are the rates charged (in currency) for transmitting money to any part of the United States:

On Orders not exceeding \$20.....10 cents. Over \$20 and not exceeding \$50.....25 cents. No fractions of cents to be introduced in an Order.

Required for the sum of \$..... Payable at..... State of..... Payable to..... Residing at..... State of..... Sent by..... Residing at..... State of.....

ENTERED IN REGISTER..... Postmaster.

The applicant must, in all cases, write his own given name and surname in full, and when the given name of the payee is known, it should be so stated; otherwise initials may be used. The given names of married women must be stated, and not those of their husbands.

As there are several places of the same name in the United States, applicants must be careful to indicate which of them they mean; and the Postmaster will satisfy himself, before writing out the order, that the place indicated is the one intended.

List of Money-Order Post Offices in the Pacific States and Territories, May 20, 1867.

Machinery.

VARNEY'S PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

for rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

This Amalgamator Operates as Follows: The pan being filled, the motion of the miller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed. Mill men are invited to examine these pans and setters for themselves, at the PACIFIC FOUNDRY, San Francisco.

Hunt's Double-Action Pump

Is cheap, durable, strong, and not liable to get out of order. Built and on hand at No. 28 Secord street, and 108 Jessie street. 12v16tf

PATTINSON'S

HURDY-GURDY WATER-WHEEL.

The inventor of this Wheel having, after much delay, finally obtained the patent for the same, is prepared to sell rights therefor to such as may be desirous of putting them up, or continuing those already in use. This is well known among miners as the "hurdy-gurdy wheel," and is considered the most economical Water-Wheel now in use.

Notice is hereby given, that the subscriber is the inventor and holds the patent right for the construction and use of the same; and that no person has a right to manufacture or use them without his permit. 7v15-qr THOMAS PATTINSON.

Brodie's Patented Improvements

FOR THE TREATMENT OF Gold and Silver Ores.

BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER. The attention of all interested in Mining is respectfully called to his Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the inventors are enabled to offer these machines to the public at the following low terms: No. 1.—Or 10-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price \$500 No. 2.—Or 15-inch Crusher, capable of similarly putting through five to six tons per hour. 850 No. 3.—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour. 1,300

EXPLANATION OF THE ABOVE ENGRAVING. The frame is made of cast iron, bound with heavy wrought iron bands, making it very strong, and at the same time light and portable. The crusher is bolted to a wood frame of sufficient height to clear the fly-wheel, and allow the crushed quartz to pass off. The dotted lines show the movable and stationary jaws. Letter A represents the eccentric shaft by which the power is applied direct to the movable jaw. B represents the movable jaw, and C the fixed jaw. D represents the link or radius bar, E represents the bolts for regulating the opening, F, which can be regulated at pleasure, so as to graduate to the size to which it is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designated.

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, D, gives the movable jaw, B, a forward and downward motion at the same time, and which makes the hardest rock yield and separate into fragments of any desired size.

The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Rawhide Ranch, Tuolumne county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Fulton Foundry, First street, San Francisco.

The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Rawhide Ranch" Mine, in Tuolumne County: Rawhide Ranch, Tuolumne Co., Sept. 23, 1866.

JAMES BRODIE, Esq., San Francisco.—My Dear Sir: I give you my pleasure to inform you that I have for the past three months had one of your largest sized Rock Crushers in use, at the Rawhide Ranch Mining Company's Mill, which has entirely met my expectations; and I have no hesitation in recommending it to all who are in need of a machine for rapidly, cheaply and properly preparing quartz for the stamps. Yours truly, R. P. JOHNSON, Supt. Rawhide Ranch Quartz Mill.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.

For the present it is not intended to grant licenses for the use of the improved German Barrel, for a longer term than twelve months. All persons desirous of commissioning, without having recourse to legal means for past infringements, or desirous of receiving Letters of License for the limited period named, are requested to address as below. A claimant, with explanation of this machine, will be found in the "Mining and Scientific Press," of September 23rd, 1866.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—This Dry Crusher has been found the most economical and effective mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 23d, 1866. JAMES BRODIE, Pacific Foundry, Express Building, 402 Montgomery street, San Francisco. 12v15tf

E. O. HUNT, Manufacturer of

Windmills, Horse-Powers, Pumps, Pumping Frames and Gearing.

HUNT'S ADJUSTABLE WIND MILLS to have all the sails so arranged as turn edgewise to the wind when the mill is stopped. The sails can be set at any angle to suit the force of the wind, while the mill is running, by means of the brake lever at the foot of the mill, by any person. HUNT'S SELF-REGULATING MILL is strong, durable and cheap. It is provided with means for stopping for running pumps, from steam or other power, constantly on hand and built to order. Water Tanks built to order. No. 23 Secord St., and 108 and 110 Jessie St. 2v15qr

Tread Horse-Powers, Swap Horse-Powers, Pumps in great variety, Single and Double-Acting. Frames and Gearing for running pumps, from steam or other power, constantly on hand and built to order. Water Tanks built to order. No. 23 Secord St., and 108 and 110 Jessie St. 2v15qr

DR. BEERS' PATENT WIRE GAUZE AMALGAMATOR.

THE ATTENTION OF QUARTZ, HYDRAULIC AND Placer Miners, is called to this new invention for saving Fine Gold. It is designed to furnish the miner with a cheap and simple apparatus by which the finest free gold can be saved without loss, requiring little attention, no machinery to drive it, and will positively collect every particle of amalgam, or of waste mercury that may have escaped from mill or sluice, and as these particles are always charged with more or less of this item alone, in many instances, will more than pay the cost of this Amalgamator every month. For Circulars, and further particulars, address Dr. J. B. BEERS, San Francisco, For Wells, Fargo & Co's Express. 11v15 6m

NELSON & DOBLE, AGENTS FOR Thomas Firth & Sons' Cast Steel, Files, Etc., Shear, Spring, German, Plow, Blister and Toe Calk Steel, manufacturers of

TO SPORTSMEN.

THE UNDERSIGNED, HAVING BEEN APPOINTED Sole Agent for the Pacific Coast for the sale of ROYER'S BREECH-LOADING SHOT GUN, which discharges four shots in two seconds, circulars will be furnished by applying to or addressing HENRY ETEL, 111 Second street, Or Lock Box 1172 P. O., San Francisco. 13v15-2m6m

Economy in Advertising.—THE MINING AND SCIENTIFIC PRESS is the best and most economical mining advertising medium in this city. Our terms are less than ONE HALF the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The Press contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

Engraved to Order.—Persons who desire to illustrate their individual establishments or business, should give us their orders for Engraving and Printing, and we will guarantee good work and reasonable prices. HEWEY & CO., Patent Agents, Publishers and Job Printers, 503 Clay st.

PICKERING'S ENGINE REGULATOR,

Warranted the Best in Existence. Cheap and easy to attach to any Engine, old or new. Send for a Circular, to DAVID STODDART, 114 Beale street, San Francisco. 12v15-2am1q

SUPERIOR CUT-OFF ENGINES.

We desire to call the attention of Engineers, Manufacturers, and Millmen, to the celebrated

Hartford Engine, With Wright's Patent Variable Cut-off, which we are now manufacturing under a license from the Woodruff & Beach Iron Work Co., Hartford, Ct. To parties wishing a First-class

Fuel-Saving Engine, Simple and durable in construction, this Engine is offered in the belief that it is superior to any other manufactured. It enjoys the very highest reputation in the Atlantic States, where it is well known; over 300 of them having been built by the Woodruff & Beach Company, and being now in successful operation.

GODDARD & CO., Pacific Iron Works, 9v15it San Francisco, Aug. 23, 1867.

The Largest Armor Plate in the World—Interesting Process.

One of the finest, thickest, and heaviest armor plates ever rolled in the world, was recently pressed into the very perfection of a manufactured armor plate at the great Atlas Ironworks of Sir John Brown & Co., Sheffield. The size of this monstrous slab of iron, when in the furnace, was a little over 20 feet long by about 4 feet broad, and 21 inches thick. Its rough weight was over 21 tons. It was built up in the furnace before being rolled by five plates, each three inches thick, and one plate of six inches. The plate, when laid in the furnace, rested upon little stacks of fire bricks, so that the flame and heat played equally around it till it was all glowing white, and the successive layers settled down into one dense mass. As the time for "drawing" approached, bands of workmen, to the number of about 60, arranged themselves on each side of the furnace, as near to it as they could bear the heat. Then the doors were opened to their fullest, and what had been a glare before, and what had been a heat, were quite eclipsed by the intense light and fervency with which the long tongues of flame leapt forth. In the midst of this great light lay a mass even whiter than the rest. To this some half a dozen men drew near. They were all attired in thin steel leggings, aprons of steel, and a thin curtain of steel wirework dropping over their faces like a large, long visor. All the rest of their bodies were muffled in thick, wet sacking. Thus protected they managed, with the aid of a gigantic pair of forceps slung from a crane above, to work as it were amid the flames for a few seconds, and to nip the huge plate with the forceps. The signal was then given, and the whole mass of iron, fizzing, sparkling, and shooting out jets of lambent flame, was by the main force of chains attached to the steam rollers, drawn forth from the furnace on to a long wrought-iron car. The heat and light which it then diffused were almost unbearable in any part of the huge mill, but the men seemed to vie with each other to approach and detach the colossal pinchers which had drawn the iron forth. More than a dozen attempts were made before this was effected, and more than a dozen of the best and most skillful workmen were driven back one after another by the tremendous heat and glare. At last all was made clear. The forceps was drawn away, the chains cleared from the rollers, and the other workmen seized the chains attached to the iron truck, and drew it to the incline by main force, where it was left by its own weight to run into the jaws of the rolling-mill. The workmen rushed for shelter in all directions as the mass was nipped between the rollers, and wound rapidly in amid quick reports like those of dull musketry, as the melted iron was squeezed by the tremendous pressure from the mass, and flew out in jets of liquid fire on all sides. The turning of the rollers crushes the plate through to the other side, where it rests for a minute on a wrought iron truck similar to that on which it was brought from the furnace. The action of the rollers is then reversed after they have been brought closer together by about an inch. These again nip the plate and draw it back in an opposite direction, and again and again does this mass go forward and backwards, each time passing between a smaller space, till the whole of the huge thickness was reduced to a compact mass 15in. thick, in a quarter of an hour. During every stage of the process, quantities of fine sand are thrown upon the plate; this takes fire as it touches the flaming surface, and covers it as it melts, with a coat of silica, or with a glaze like that of earthenware, thus preventing the active oxidation, which would otherwise take place. After every discharge of sand, and these go on almost incessantly, buckets of water are thrown upon the plate and explode in scalding steam, and when these are partly dissipated, men rush forward and with wet besoms, with handles 20ft. long, sweep off whatever little scraps of oxidation may have taken place. Thus, every time the plate passes through the mill, the sand is scattered, the water thrown, and the surface swept, and at every roll the chief roller of the establishment runs forward, and under the shelter of wet clothes, measures with a gauge its thickness end to end. The required dimensions were obtained, as we have said, by less than a quarter of an hour's rolling, and a plate 15in. thick, the product of the labor of nearly 200 men, and of the consumption of nearly 250 tons of coal, was shot out by the rolling mills and left to cool. When this had been effected, two large rollers of iron, each weighing 15 tons, were left upon its ends to keep the whole perfectly level. Nothing further now remained in order to complete it as the finest specimen of armor

plate manufacture ever attempted, but to plane off its rough ends and edges. The flat surfaces on either side, which form what is called the skin of the plate, are never interfered with, for the action of the steel rollers leaves them literally almost as smooth as plate glass.

THE NAPOLEON CANNON.—A special correspondent of the London Times, writing from Paris of the Napoleon's new cannon, says: "It seems to be a sort of light revolving cannon. I suppose it is to be a surprise, like the rifled guns in the Italian campaign. The strangest stories are circulated about it; the Emperor is supposed to be himself the inventor, or, at least, the joint inventor with the Colonel of Artillery, who had so much to do with the model gun of 1858, and who is supposed to have turned out these new weapons from his factory at Meudon. It is supposed there are great numbers of sealed cases deposited somewhere or other, and each battalion is to be provided with two of them. Rumor says that the projectiles are not discharged by the force of gunpowder, but by some other agency, and that the effect is a shower of bullets. One would almost wish for a war, to see these new infernal machines.

WROUGHT IRON is often found to stand more wear or friction than cast iron. At Denver there is a quartz grinder which had, as usual chilled cast iron rubbers. When they require renewing, there were no cast iron to be had, so rubbers of wrought iron were substituted as a temporary resort. But, to the surprise of every one, these outlasted two sets of castings, doing the same work. This induced a trial of steel. But it proved inferior to the wrought iron, which is now used altogether. The explanation probably is, that to the fibrous structure of wrought iron is due its lessened liability to abrasion; whereas the crystalline and brittle structure of cast iron presents chipping angles to the man.—Atla.

A CURIOUS trial of strength occurred in Buffalo some days since. There was a dispute as to the relative strength of two tugs, and it was decided by attaching a strong hawser from the stern of one to the other, and that at a given signal each endeavored to pull the other backward. The winning, and of course the strongest tug, dragged the other off captive.

THE NORTHERN PACIFIC RAILROAD.—The engineers of the Northern Pacific Railroad have completed their survey of the passes in the Cascade range, and find them not as bad as formerly believed. The altitude of the highest was 4,000 feet, and of the lowest 3,150 feet. Only six passes were examined. The object of the survey is to furnish data to lay before Congress in order to obtain, if possible, a subsidy.

DISEASE is simply obstruction. The man who can touch the bottom of his lung with a bit of fresh air, and the end of his toe with a little blood, may laugh at the doctor and break off acquaintance with the undertaker, He is sure of getting into the nineties.

**BLAKE'S PATENT**  
**QUARTZ CRUSHER.**  
**CAUTION!**  
The owners of the Patent for this valuable machine, in order to facilitate the protection of their rights against numerous infringers, procured, some time since, a release of the Patent, bearing date January 9th, 1866.  
This Patent secures the exclusive right to employ in Stone-Breaking Machines Upright Convergent Jaws, actuated by a Revolving Shaft.  
All persons who are violating the Patent by the unauthorized making, selling or using machines in which quartz or other materials crushed between upright convergent jaws, actuated by a revolving shaft, are hereby warned that they are appropriating the property of others, and they will be held responsible in law and in damages.  
Several infringing machines are made and offered for sale in this city, upon which Patents have been obtained. Manufacturers, purchasers and users, are notified that such Patents do not authorize the use of the original invention, and that such machines cannot be used without incurring liability for damages.

**It is a Fact,**  
That BOWMAN'S AMERICAN WASHING COMPOUND is the best article for Washing and Cleaning yet discovered. It is acknowledged to be a saving both in money and labor. As the compound softens the dirt, the clothes require not more than one-half the rubbing necessary in washing by the old method. Besides all who give it a trial acknowledge that their clothes are whiter in washing with this compound than they were ever known to be by using any other preparation. For washing woolen goods and linens, it cannot be equalled. Clothes that cannot be washed with soap without fading are washed in the water used for boiling white clothes. This Compound has been used in the Eastern States for the past three years, with perfect success.  
**WARRANTED NOT TO INJURE THE CLOTHES.**  
For sale by all Grocers.  
14v15-3m LYNCH & PARSONS, Agents, 222 Jackson street, near Battery.

**Mining Secretary.**  
THE SUBSCRIBER, HAVING SERVED FOR THE LAST five years as Secretary of various mining companies, feels fully competent to serve in that capacity. Any parties wishing to secure the services of a Secretary can be accommodated on reasonable terms. Information given, and all necessary papers correctly made out.  
Having had a long experience in the purchasing of goods and machinery for miners, parties in the mines will find it to their advantage, where purchasing agents are employed, to send their orders to the undersigned.  
17v15-1f J. M. BUFFINGTON, No. 5 Government House, San Francisco.

**Coppers! Coppers!**  
**75,000 LBS. IMPORTED COPPERAS—SULPHATE**  
of Iron—for sale in lots to suit, by  
BENJ. BRADY, 103 California street.  
13.15-3m S.W. corner Davis, up stairs.

California Academy of Natural Sciences.

REGULAR MEETING.

MONDAY EVENING, Nov. 18, 1867.

President Whitney in the chair. Twenty-five members present.

R. H. Stretch, late State mineralogist of Nevada, was elected a resident member.

PROPOSED SITE FOR AN ACADEMY BUILDING.

Dr. A. B. Stout, from the Committee on Building, submitted a report of progress, recommending that the Legislature be petitioned to authorize the occupation and improvement by the Academy of Yerba Buena Square, and proposing, if the grant is obtained, to lay out and ornament the grounds, establish a botanical garden, and erect a building in which the geological, paleontological, hotanical, zoological and mineralogical collections of the Academy, and of the State Geological Survey, could be preserved and opened to the instruction and pleasure of the public. The square comprises 16 acres, and under the charge of the Academy would be not only promotive of scientific uses, but be kept open at all times to the people as an attractive and healthful park. On Dr. Cooper's suggestion, the committee was continued, with instructions to report again and to take such measures as are likely to promote the object in view.

MINERALOGY OF THE PACIFIC.

Professor Whitney made the following remarks on the elementary substances occurring in California and the Pacific States and Territories, both of North and South America, in continuation of his remarks upon the same subject at the previous meeting:

The subject of the relation of the accidental minerals occurring on the Pacific coast was brought forward by me at the last meeting, and I wish now to add a few words in regard to the elementary substances occurring in California, an inquiry which will also afford us some interesting data for comparing this geological and chemical conditions prevailing through the great chain of the Cordilleras of North and South America.

I find on carefully tabulating the facts observed by the Geological Survey, in regard to the mineral combinations existing on the coast, that of the 64 elementary substances existing in nature, so far as yet known to chemists, there are only 36 which have yet been proven to occur in California, in mineral combinations.

Those which are wanting here are the following: Bromine, Glucium, Cadmium, Cassium, Cerium, Didymium, Erbium, Fluorine, Iodine, Indium, Lanthanum, Lithium, Nihium, Norium, Palladium, Ruthenium, Rubidium, Strontium, Tantalum, Terhium, Thallium, Thorium, Uranium, Vanadium, Bismuth, Tungsten, Yttrium, Zirconium (28.)

Of elementary substances occurring in the adjacent States, and not yet detected in California, there are, so far as I know, only three, namely: Bismuth, Fluorine and Tungsten. This would make 23 elements wanting on the Pacific Coast of North America. Of these a few are extremely rare in general, and would hardly be expected to occur here. Among these are Didymium, Erbium, Indium, Lanthanum, Norium, Thorium. But there are others, the absence of which is indeed quite surprising. Fluorine, for instance, is an element of extremely wide distribution, and one which occurs in great quantity in most mineral countries. Here it will probably, hereafter, be detected in our micas, and perhaps in other combinations, and also in mineral and sea water; but its most abundant source, fluor-spar, seems entirely wanting in this State.

Bismuth is another element of common occurrence in various combinations, but it has not yet been detected in California. A few minute scales of a mineral that I determined to be bismuth silver, from the Twin Ophir mine, Nevada, is the only authentic instance I know of thus far, of the occurrence of this element on the Pacific coast. Tungsten, Uranium and Vanadium, are tolerably widely disseminated; the latter, however, less so than the former. No trace of either has yet been found on this coast north of Mexico; of Strontium, Zirconium, and Glucium, the same may be said. If now we compare the distribution of the elements in the South American Andes with that on this coast, we shall find some striking points of resemblance, and to a large extent, either the absence, or else the great rarity of several of the elementary substances not seen in other mineral regions, is a fact which holds good along the whole ex-

teny of the American Continent on the Pacific side. Fluorine, in combination with calcium, is almost as rare in Peru, Bolivia, and Chili, as on this coast. Indeed, until recently, it was supposed by Domeyko not to occur at all in Chili, but recently one or two localities, where it is found in small quantity, have been made known. Tungsten occurs in Peru at one locality in the form of Wolfram, and in Chili in one or two localities, also in Lower California, but its combinations are extremely rare along the whole coast. The same may be said of Uranium. Strontium and Zirconium have not yet been discovered in Chili or Peru, although the former occurs in one locality in New Grenada, and Glucium has only been recently found in Chili in very minute quantity in one locality. No combination of Lithium is yet known on the Pacific coast.

Among the general facts connected with the occurrence of mineral substances and the elementary bodies on the Pacific coast, and especially in the Cordilleras of North and South America, the following may be met and is generally applicable to the whole of the vast region extending from British Columbia to Chili:

1st. The paucity of species considering the extent of the region as compared with other parts of the world, and especially with other mineral regions.

2d. The remarkable absence of the prominent silicates, and especially of the zeolites.

3d. The absence of a large number of the elementary substances, and the paucity of several others of very common occurrence in other mineral regions.

4th. The very wide spread and attendant occurrence of the precious metals, gold and silver, and the not uncommon occurrence of platina.

5th. The great abundance of ores of copper, and the comparative absence of tin and lead.

6th. The similarity in the mineralized condition of the silver—sulphur, antimony and chlorine being the principal mineralizers of these metals—while in Chili the rarer combination of iodine, bromine, and selenium occur, these latter being as yet unknown north of Mexico.

7th. The absence or paucity of veinstone or gangue of one of the most prominent minerals occurring as much in other mineral regions, namely, fluor, to which it may be added, that both calcite and barytes are extremely rare as veinstones in California, and to judge from all the Mexican and Chilean collections that I have seen, well crystallized specimens are very rare in those countries.

8th. There is no elementary substance and but few mineral species peculiar to the Pacific coast.

ALTITUDE OF DEATH VALLEY.

Prof. Whitney presented a paper from Major Williamson, detailing a series of barometrical observations, and the processes by which they were verified, to ascertain the altitude of Death Valley—a remarkable depression lying partly in San Bernardino and partly in Inyo county, between Owen's Lake and the Nevada State line. This valley is stated in the Geological reports to be about 150 feet below the level of the sea, and is further remarkable for the peculiarity of its flora. The Nevada papers have lately denied, on the authority of observation made by Mr. Gabb, the accepted statements on this subject, and asserted that Death Valley is really several thousand feet above the sea, and has no such peculiar features as have been assigned to it. Prof. Whitney said this contradiction resulted from confounding the upper sink of the Amargosa river, in Nevada, with the lower sink of the same stream, in California, distant 70 miles in a direct line and 200 by the river, which is the true Death Valley, and was not seen by Gabb. Major Williamson's paper demonstrates that the lower sink of the Amargosa, though situated in the high Sierra, is at least 100 feet below sea level, and several thousand feet below the summits of the surrounding mountains. The paper will be published by the Academy.

CALIFORNIA CONIFERÆ.

Mr. Bolander, referring to a previous enumeration of pine species in California, submitted by him, stated that he must now reduce the number of true species by one, leaving the total at only fifteen. He also remarked upon this species of fir in this State, enumerating four only, which are strongly marked. He showed the leaves and seeds of two species, and commented upon the mistake of Murray, in asserting that there is a fifth species, which he calls *Picea Magnifica*, but which is really *Picea Amabilis*. Mr. Bolander thought the tendency to multiply species erroneously was attributable to a desire to make a market for seeds, those of new species being always in demand at good prices.

McCORMICK'S REAPER.—The inventor of this world famous reaper, was recently invited by the Emperor Napoleon to give a private exhibition of his machine. McCormick didn't refuse.

SULPHURETS;

What they are; How Assayed; How Concentrated; And How Worked; With a Chapter on the BLOW-PIPE ASSAY OF MINERALS.

By WM. BARSTOW, M. D.

Published by A. Roman & Co., San Francisco.

For sale at this Office.—Price, One Dollar.

With the aid of this Book, the miner can assay his own ores, requiring but few materials, etc., except such as are generally to be found in the interior towns. 21v15f

Parties desirous of Taking

A COURSE OF INSTRUCTION IN CHEMICAL ANALYSIS,

THE ASSAY OF ORES,

And the Use of the Blow-pipe, OR ANY PART OF SUCH COURSE, May apply at this Office.

Pupils will have the advantage of a Complete Laboratory. 19v15

NOTICE TO MERCHANTS

MANUFACTURERS.

Moore's Patent Friction Hoist.

Now in successful operation in the principal stores in San Francisco, possesses many advantages over the common Hoist—viz: Greater strength; less danger in working, as goods require no slinging or landing, consequently make fewer breakages; requires one man less to operate it; stops with the load at any point, without any tending or attention from the operator.

The undersigned take this opportunity to notify all whom it may concern that they have secured, by letters patent, the application of a friction pawl, or stop, to hoisting machines, and that they will prosecute any party making or using any machine infringing upon the same. YULGAN IRON WORKS CO. By JOSEPH MOORE, President. 21v15 f

MINING COMPANIES

Can get their Printing done cheaper and better by TRUESDELL, DEWEY & CO. Than at any printing establishment in the city.

COUNTY OFFICERS

Can get their Blank Books and Blanks cheaper of TRUESDELL, DEWEY & CO., Than of any other printing house in the city.

MERCHANTS

When you want Printing done cheap, send to TRUESDELL, DEWEY & CO., Who do all kinds of Printing at the lowest rates.

FOUNDRIES

Will save money by having their printing done by TRUESDELL, DEWEY & CO., Who have put prices down to the lowest rates.

EVERYBODY

Who wishes to save money and get good work, see TRUESDELL, DEWEY & CO., Who are always ready to receive and fill orders.

MANUFACTURERS

Can get their Printing well done at low prices, by TRUESDELL, DEWEY & CO., Who are now prepared for all kinds of Printing.

TRUESDELL, DEWEY & CO.

BOOK AND JOB PRINTERS, MINING & SCIENTIFIC PRESS OFFICE 505 CLAY STREET, SAN FRANCISCO.

W. T. GARRATT, City BRASS AND BELL FOUNDER.

Cor. Mission and Fremont sts., SAN FRANCISCO.

Manufacturer of Brass, Zinc, and Anti-Friction or Babbet Metal Castings; CHURCH AND STEAMBOAT

BELLS,

TAVERN AND HAND BELLS AND GONGS,

FIRE ENGINES, FORCE AND LIFT PUMPS,

Steam, Liquor, Soda Oil, Water and Flange Cocks, and Valves of all descriptions, made and repaired. Hose and all other Joints, Spelter Solder, and Copper Rivets, &c. Gauge Cocks, Cylinder Cocks, Oil Globes, Steam Whistles.

HYDRAULIC PIPES AND NOZZELS For Mining purposes, Iron Steam Pipe furnished with Fitting, &c. Coupling Joints of all sizes. Particular attention paid to Distillery Work. Manufacturer of "Garratt's Patent Improved Journal Metal."

Highest Market price paid for OLD BELLS, COPPER AND BRASS. 21v

SUPPLIES ALL EASTERN PERIODICALS By the Year, Month or Number.

Foundry for Sale.

A One-half Interest in the UNION IRON WORKS, SACRAMENTO,

Owned by William R. Williams, is offered for sale on the most favorable terms.

A Good Bargain

May be had, as the proprietor is going home to Europe. It is seldom that so good an opportunity is offered for a sure and permanent investment. The business of the establishment is exceedingly flourishing, as can be shown. The Shop is of brick, new and well built. The lot is 85 feet front by 163 feet in depth, in a good location for this business, on Front street, between N and O streets.

Inquire at the office of the Foundry, or address WILLIAM R. WILLIAMS, Sacramento, Cal.

Oakland College School.

THE PATRONS of this Institution have the choice of several distinct Departments. The SENIOR CLASSICAL is designed as preparatory to the College of California.

The SENIOR ENGLISH affords a complete course of instruction in the English branches, in Theoretical and Practical Business, Science and Art.

The JUNIOR is especially qualified to meet the wants of young boys, for whom separate apartments and Teachers are provided.

Throughout all the various departments, great attention is given to the study of the Modern Languages.

For further information, or Catalogues, address, I. H. BRAYTON, Principal. OAKLAND, California. 5v15q9p.

CHICKERING & SONS' PIANOS

Received the FIRST PREMIUM (Gold Medal)

And Decoration of Legion of Honor, at the Paris Exposition. KOHLER, CHASE & CO., Agents, 26v14nr16p 421 Montgomery street, San Francisco.

DR. FONDA'S San Francisco Eye Infirmary.

Permanently established for the treatment of all diseases of the Eye. Dr. F. was for seventeen years principal of the Lafayette (Ind.) Eye Infirmary. F. W. FONDA, M. D., Surgeon in Charge. Office, 402 Montgomery street, opposite Well, Fargo & Co's. 4v151y9p

Quartz Mill Machinery.

FOR SALE AT GREATLY REDUCED RATES.—IT HAS been used but three months, and is in perfect order. The principal items are: 2 Hendy's Concentrators; 3 Knox's Pans; Hoisting Works, and various miscellaneous machinery, Counter-shaft, Pulleys, etc. It is within half a mile of a railroad station. Address P. O. Box 59, at Folsom. 19v151w\*

AGENTS WANTED

ENERGETIC MEN OR WOMEN CAN MAKE MONEY in canvassing for our NEW BOOKS and ENGRAVINGS. One Agent reports having three orders for one Book in three days. Address: FRUIT PUBLISHING COMPANY, 4v15q9p 305 Montgomery street, San Francisco, Cal.

MINING AND SCIENTIFIC PRESS.—This valuable journal has closed its fourth volume and entered upon its fifth. It is a publication that should have a wide circulation among our mining and mechanical population. It publishes, in addition to the most complete and up-to-date news, a vast amount of information on the application of science to mining and the mechanic arts. It contains notices and descriptions of all new mining processes, and all machines intended to facilitate the extraction of the precious metals from ore and rock with which it is blended. It also chronicles all new inventions, and, in most instances, contains drawings to illustrate them. To miners and mechanics it is a paper of incalculable value, and should be in the hands of all who desire to keep themselves posted in the progress being made in these departments.—Treach Union.

## General View of the Paris Exposition of 1867.

By W. P. BLAKE, Commissioner from the State of California

### MINING MACHINERY.

It is the general expression of mining engineers and experts who have visited the Exposition, that the display of mining machinery is not as large and interesting as there was reason to expect. One explanation of the disappointment may be found in the fact that the objects exhibited are scattered about in the vast assemblage of machines in the outer circle, or are placed in the outbuildings of the Park. If all had been brought together in one place, the display would have been considered much more satisfactory. There is, however, very little that is new and striking; there is no great improvement or advance to record; scarcely anything that has not been already described in mining and engineering publications. Some of the most important of late improvements in dressing machinery are not represented at all; such, for example, as the continual working *stossheerd* of Ritterger, and his other various contrivances for sizing pulverized ores before concentration. The California pan machines, concentrators, etc., which form the bulk of our mining exhibits at the exhibition of the Mechanics' Institute, are not to be found here, nor is there a stamp mill, or the parts of one. In fact, there is not one in Europe comparable with ours for perfection of construction or in working effect. The bulk of the exhibit, however, consists of the very machines in which we are most deficient, and in which we are lamentably behind the rest of the mining world, namely, *hoisting or extractive machinery*.

The various objects may be classed under the following heads:

1. Mining Tools.
2. Rock perforators or drilling machines.
3. Boring tools for wells or shafts.
4. Hoisting engines and apparatus.
5. Cables.
6. Cages and wagons.
7. Machines for crushing and dressing ores.

### I. MINING TOOLS.

Under this head are included drills, hammers, picks, blasting implements, lamps, etc. The tools of Germany and Austria were shown in their respective sections, and were displayed upon the walls above the maps and sections of mines. All of the drills are characterized by their extreme lightness, as compared with American tools of the same kind. Round bar iron, tipped with steel, or round steel is used instead of octagonal bars. The picks, however, are more heavy and clumsy than ours, and are not so well mounted. There is no wood so well adapted to the purpose as our hickory, and in no other country is so much pains taken, as with us, in fashioning the handles of common tools. Some turned pick handles from Australia, made of the hard woods of that country may be cited as an exception.

The various mining costumes sent may be appropriately noted here; although a description is impossible. In the Chilean section the heap of copper and silver ores was

permanently presided over by a figure of a miner with one foot resting upon a block of the ore. In the Austrian section two figures displayed the peculiarities of the German miners' dress, including, of course, the fanciful cap and the leather apron placed behind. In the Park of the French section a complete miner's cottage gives a view of the home comforts of the French collier, and at the same time serves the purpose of exhibition of the great variety of coal mining tools and lamps placed around the room.

### ROCK DRILLING MACHINES.

There is more of novelty under this head than any other. We find machines for drilling holes, driven either by the force of compressed air, or by water, under pressure; machines to drill one hole or to drill several at the same time, or to cut an annular groove or channel around a central core of iron opening tunnels. To describe all these machines would be to give you a long chapter of the experience at the tunnel of Mt. Cenis. The machine of Gen. Haupt has attracted much attention here and in England, and was noticed by the General himself, at the recent meeting of the British Association at Dundee. He claims to have achieved a perfect success in the application of steam to tunneling, and he makes out a very strong case against the advocates of compressed air, by showing what an enormous force is required, to force it to great distances in pipes of ordinary diameter. He proposes to mine in true military style by throwing up breastworks in front of a blast, so that the miners need not loose time by retreating at the word "fire," but stand and face the shots like heroes. This may suit military miners, but it will be a long time before we can find any better and cheaper protection than a cross-cut or side drift.

The drilling machine has been tested in Cornwall this summer, but is said not to have given the expected satisfaction to the Cornishmen.

In the Swedish section, we may see the boring machine of Bergstroem at work upon a mass of hard iron ore. It is said to be in successful use at the Perseberg iron mines of Sweden, and to have replaced hand labor in drilling, with a saving of 20 to 25 per cent. in cost. This machine is worked by compressed air, weighs only 122 pounds, and costs about \$100. It is small and compact, and is supported in place by set-screws bearing against the top and the bottom or the sides of the tunnel.

The Swedish machine is the most portable and compact which has been shown, but we are promised something still better by Darlington, of England, who will use the pressure of a column of water to operate the drill. His machine will be shortly introduced to the notice of California miners, and it has this great recommendation for them that it is very light and cheap, and is to be operated by water alone, and does not require any engine or expense for installation.

In the French section, Messrs. Huet & Gayler show a perforator which operates upon the hardest rocks by means of rough diamonds set firmly in the end of a long, hollow cylinder, about as large as a gun barrel. The cylinder thus armed, is made to revolve rapidly and is brought against the rock by the pressure of water. The diamonds at the end form a kind of "crown saw," and they cut the rock, whether limestone, sandstone, granite or flint, into powder. This is removed by a constant stream of water, which at the same time keeps the drill cool. An annular channel or opening is thus made in the rock, and the central core of rock passes into the hollow of the drill, and breaks out when the drill is withdrawn. The diamonds last a long time before they show wear, and when

they lose their cutting angles they are turned over in the setting. The tip of the drill in which they are set is attached to the cylinder by a bayonet joint, and can thus be changed with facility.

### COAL CUTTING MACHINE.

A machine is shown in the English section for under-cutting coal beds or blocking out masses of coal. It is operated by compressed air, and will cut a channel only two or three inches wide, and two feet or more in depth. It is said to be in successful operation in England, and to effect a great saving over hand labor, not only in work, but in coal also, as there is not so much waste.

Paris, Sept. 25th, 1867.

CO-OPERATIVE ASSOCIATION.—We would call the attention of our readers to the advertisement, in another column, of the Co-operative Union Association, located at No. 115 Sutter street. This Association has been founded for the purpose of enabling its members to obtain their groceries and provisions at the nearest approach to wholesale cost, by saving the profits of the "middle men," which often constitute an important percentage in retail prices. Co-operative associations, of various kinds, have become an important feature in the commercial and industrial history of the day. When properly organized and conducted, they are generally found advantageous to those interested in them. They afford the most legitimate and only efficient means for settling differences between labor and capital. While the "strikes" of the last few years have cost the working men of this country and Europe millions of dollars and indescribable misery and suffering, to say nothing of the bitterness of feeling engendered between the employer and employe, co-operative associations have multiplied, almost without number, and in almost all instances have been productive of good, and good only. Capital itself has in numerous cases recognized the beneficial influence of the principle, and entered into friendly alliance with labor to mutual benefit, both pecuniarily and socially. The workingmen of this city would be greatly benefited by discarding most of their present advisers, who are usually influenced by political or private considerations, rather than the good of those they affect to serve, and following the advice and example of the more considerate, better informed and less selfish co-operative writers of England and the Atlantic States.

PATENT SOLICITOR.—We would direct attention to the card of Dr. Daniel Breed, of Washington, which will be found in to-day's issue. We have had the pleasure of a brief acquaintance, only, with the Doctor, but can say he certainly promises well. It is the practice of at least one scientific journal in the Atlantic States to refuse to notice, or even advertise competing patent agents. That is not our rule, however, and we cheerfully give this notice to our Washington friend and competitor.

OVER THE SUMMIT.—The rails are now being laid through the summit tunnel, and the first passenger train, which will carry an excursion party, will be made early next week.

## Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

### The Freiberg, or Barrel Process, for the Reduction of Gold and Silver Ores.

BY PROF. ROWLANDSON, F. G. S. L.

NUMBER THREE.

#### THE REDUCTION OF CHLORINATED SILVER ORES WITHOUT MERCURY

DR. PERCY'S, or, as it is sometimes erroneously called, VON PATERA'S, method. About 1840, owing to a considerable importation into England of native chloride of silver from Chili, Dr. Percy, the present Professor of Metallurgy at the School of Mines, London, proposed the method of leaching out the chloride of silver by means of the hyposulphite of soda, but I am not aware that any one proposed to introduce this method into practice, by acting on chlorinated silver ores artificially produced in the manner already described, until Von Patera adopted this method at the Joachimsthal mines, and subsequently employed on copper mats at Eiselhen and Freiberg. No known substance has the effect of converting the insoluble chloride of silver into a soluble form so economically, and at the same time efficiently, as hyposulphite of soda; and, in expert hands, it is a most effective agent. The precipitant employed to eventually obtain the silver so rendered soluble, is the five-fold sulphide of sodium.

Some have recommended this process for adoption on this coast, and certain parties tried the same and failed in Lower California. The latter, not so much on account of any inherent defect attached to the process itself, as being attempted upon ores not fitted for its employment, and under the direction of inexperienced individuals; in able hands it is a most elegant and effective method.

#### AUGUSTIN'S METHOD

Comes next under consideration. In this mode, also, the ore has to be chlorinated—the mode adopted being that of the ordinary Freiberg chloridizing process introduced by Gellert. In place, however, of using mercury for the purpose of obtaining the silver, a hot saturated solution of common salt is employed for the purpose, the silver contained in the argentiferous brine being precipitated by flowing through three vats, the bottom of each of which contains a layer of cement copper. The reader will perceive, by what has preceded, that, with the exception of the liqating method, and that associated with the reduction of the precious metals in association with lead, by means of its oxides or ores, all the methods for obtaining silver from the time of Medina, in 1547, to the year 1855, when Ziervogel first introduced the mode of extraction by the employment of hot water, that chlorinating by one means or another was essential to all.\*

#### PRELIMINARY TREATMENT OF LOW GRADE ORES PREVIOUS TO EMPLOYING ZIERVOGEL'S METHOD TO EXTRACT THE SILVER THEREFROM.

Before entering into technical details, it will probably not be an unacceptable piece of antiquarian information to many to mention, that the ore obtained by Ziervogel for his earliest experiments was procured from the same vein at which the father of Martin Luther wrought as a miner more than three centuries ago; the same vein also furnishes the largest amount of ore which is at the present time treated by the hot water method. The Mansfeld ores here alluded to, from which the silver is extracted by the above named method, are exceedingly poor in the precious metals, containing at the highest average not more than 2% per cent. of metallic copper and only 1-70 of one per cent. of silver. It may be well to here state, as the fact is most probably not known to

the bulk of readers, that the Mansfeld bituminous copper schists now under consideration possess a peculiar character, consisting, as they do very largely, of bituminous matter, which it is desirable should be got rid of to a great extent prior to subsequent treatment by the blast furnace. This is effected by:

No. 1.—*Roasting the Schists*, by burning it in heaps in the open air; which, when completed, is followed by

No. 2.—*Fusion of the Roasted Ore*, which is effected in a kind of blast furnace, called a *Brillen Ofen*, in which the roasted ore is mixed with any needful flux, concentration slags and fluor spar being those most commonly employed. The last named circumstance ought to be sufficient to convince the Stevens flux men of Boston that their boasted process is nothing new. In this stage of the operation, ore-furnace regulus (*Rohstein*) is obtained, containing from 22 to 33 per cent. of copper, which is now ready for

No. 3.—*Roasting of the Ore-Furnace Regulus*. This has been found from experience to be requisite, in order to obtain the most perfect results. This roasting is effected in kilns, (another pseudo invention palmed on ill-informed Californians) by which it is prepared for

No. 4.—*Fusion of the Roasted Ore-Furnace Regulus*. This final concentration is now always performed in a reverberatory furnace, the flux employed being quartzose ores, sand or ore-furnace slag. In the course of this last described operation, a concentration regulus is obtained which is generally composed of from 65 to 69 per cent. of copper, 6 to 7 per cent. of iron, 0.3 per cent. of silver, and the balance sulphur. When the concentration regulus is fully formed, the furnace is tapped and the regulus is allowed to flow into water, by which means it becomes granulated, and consequently of much more easy pulverization by the subsequent grinding process, which is requisite in order to prepare the concentrated regulus for the succeeding roasting or oxidizing process.

No. 5.—*Extraction of the Silver*. It may be mentioned that since 1831, with the exception of some parts of the Hartz and other European localities, silver ores have very generally been concentrated from their gangues, not by the ordinary aqueous methods, by employing buddles, etc., but by fire, by means of which a regulus is ordinarily obtained, constituting a chemical formula as follows, without the percentage proportions being given, viz:  $Fe S, Cu S,$  and  $Ag S$ , which has to be roasted until these compounds are first converted into sulphates (unless when the chlorinated mode is employed); this can only be insured by the roasted ore containing a sufficient supply of sulphur for this object and the free admission of oxygen during the operation. For this purpose, the well known double-bedded furnace is employed.\* The progress of the operation is carefully watched, and test samples from time to time withdrawn, in order to ascertain the progress made. This oxidized roasting is continued until the metallic contents of the furnace are converted into sulphates, and also, to some extent, into oxides, by the continuous action of an elevated temperature. This reduction from a sulphate to an oxide is found more particularly to take place with the sulphate of iron previously formed, which, from the combined causes above named, is the first to evolve its sulphuric acid and become converted into the per or red oxide of iron; the sulphuric acid so evolved doing good service, however, by aiding the conversion of the silver present into the desired sulphate. When the whole of the silver present has become a sulphate, the operation might be stopped, and the remaining soluble salts of silver and copper present removed by means of hot water, or, still better, hot water slightly acidulated. This would be the best mode in cases such as will generally occur with Comstock ores, if this process should ever be employed for their reduction, as the silver could be precipitated from the solution obtained by employing cement copper; which dissolved copper, as well as that leached from the roasted ore, could be recovered by again being reduced to cement copper by precipitation with iron.

I have thus deviated from describing the actual course now followed to a large extent in Germany, for the purpose of extracting silver, in order to illustrate how requisite it is, before forming any definite opinion respecting the prudence of adopting any particular method, of well weighing all the attending circumstances which may be connected therewith. Thus, in Nevada, the chief objects sought are gold and silver; the

\* It is in the furnace operations, as will be shown hereafter, that some of the chief improvements are to be sought. An ingenious friend has shown me how many inconveniences heretofore existing may be obviated by certain mechanical contrivances.

copper in the ore being scarcely of any account; on the other hand, with the ores reduced in no inconsiderable portion of German silver reduction works, the copper in the ore exceeds in value the silver to be obtained, and gold is not present. In consequence of the facts just named, at the European works alluded to, in place of leaching out the sulphate of silver at this step in the process, in the manner which I have previously indicated, (which would, on many accounts, be the most desirable mode, too lengthy, however, now to describe;) at Gotteshelohnungshutte, and other similar reduction works, a second stage in the roasting occurs, which is technically termed "the dead roasting," by which it is attempted to decompose all the sulphates, excepting the sulphate of silver; this last step being an exceedingly delicate matter, as will be hereafter noticed. By doing so, the sulphate of copper is converted into an oxide, in which form it is insoluble in the hot water which is employed to dissolve out the sulphate of silver; the former consequently remains in the roasted regulus so desilverized. After which, the highly cupiferous mass which remains, is smelted for black copper, and subsequently refined. The soundness of the mode employed in Germany, when such ores can be treated as above described, is easily to be seen when a comparison is made of the value of the different products sought are compared—copper and silver—thus: the value of the copper contained in a ton of concentrated regulus will amount generally to \$350, whilst the silver in the same will scarcely reach one-half of that amount, or about \$170. In addition to this great difference, it may be mentioned also that as much nickel is obtained from the granulated refinery slag as about pays the cost of the subsequent stages required to procure fine copper from the desilverized concentrated regulus.

The difficulties which chiefly present themselves during Ziervogel's method, especially if the desilverized copper has subsequently to be smelted, arises from the necessity of decomposing the larger portion of the sulphates, excepting only the sulphate of silver, no part of which latter ought to be decomposed, nor its solubility in water diminished by prolonged calcination, for it is not only requisite to convert the whole of the silver present into a sulphate, whether originally metallic or mineralized, and to maintain it in this soluble form, but at the same time convert the martial and cupreous accompaniments into oxides or insoluble basic sulphates.

Another essential of success is, that it should be constantly kept in view, that, if the roasting is insufficient, a portion of the silver will remain in its mineralized condition as a sulphide, and if subjected to too high a temperature, metallic silver may be formed by the decomposition of the sulphate; in neither of which cases could the hot water act upon them. The water employed should be entirely free from chlorides, otherwise to the extent of their presence would the silver be rendered insoluble.

With experienced and well directed workmen, results are obtained by this method which approximate as nearly as possible to perfection as can be fairly looked for when operating on the large scale; provided, however, that the ore is of the simple composition above noticed. When, however, arsenic and antimony are present, the problem is more difficult, and if not removed at one or more of the earlier stages, insoluble arseniates and antimonates of silver would be formed. In such cases, the roasting has to be so conducted as to secure the volatilization of these obnoxious metals. This and many other points for the sake of condensation are here omitted. Those wishing to peruse a more detailed account are referred to the EIGHTH VOLUME OF THE MINING AND SCIENTIFIC PRESS, page 262, on which will be found a copious description of this method. It will be obvious to any one conversant with these matters, that any gold existing in the ore cannot be extracted by Ziervogel's method, without having recourse to a second operation for the purpose of procuring that result. Two other difficulties will readily occur to many, so far as this coast is concerned. First—How is the continued attendance of numerous expert workmen to be obtained? Second—In what manner is the presence of sulphur in the ore to be secured, so as to obtain the requisite sulphatization at any reasonable cost of fuel and labor.

CLEANSING TUBS OR STONE JARS.—Some young housekeepers may like to know how to cleanse tubs or stone jars. Fill them with hay (dry hay) and pour on boiling water; cover up immediately, and let it stand until they get cold, and the vessel will be found to be perfectly sweet.

[Written for the Mining and Scientific Press.]

#### Glacial Action.

EDITORS PRESS:—In your paper of Nov. 9th, there appeared a paper by Prof. Blake, translated from the French, on the origin of the Yo-Semite Valley; wherein he attributes the phenomena presented by the granite domes, in its vicinity, to ancient glacial action. To my mind, the true reading of the facts which he presents, leads to quite a different conclusion. Now, if the wavy and striated surface of those elevated summits is entirely due to ancient glacial, why is not the granite rough and weather-beaten like the surface of granite boulders which are but a few yards across? But, he says, "the view extends over an immense expanse of summits, all rounded off, and in a great part so highly polished that they glitter in the sun;" a fact, showing that the annual fall of snow, which is converted into granular ice, has the power to continue the polish over the broad surfaces which he supposes to have been originally polished by ancient glacial action. If the action of the great depth of snow can be supposed to continue the polished surface, why may not its rounded, wavy, striated appearance be entirely due to the same cause; since feldspathic granite, on account of the large amount of potash it usually contains, is the more readily acted upon by atmospheric agencies? Snow falls many feet in depth upon those elevated summits, each winter, which, by the action of the prevailing winds, is drifted into the gorges and other inequalities, forming an icy covering, (not the less potent because it does not continue through the year,) dragging with it detached particles of the friable rock, thus giving the surface an annual scouring.

When phenomena can be traced to ordinary, visible agencies, where is the necessity of referring them to causes outside of those already existing and in operation? I have observed that when the advocates of extraordinary ancient glacial action wish to exercise their imaginations, they always select certain choice localities, where the formation, owing to its chemical composition, is easily acted upon by disintegrating agencies. Why should they not also see evidences of ancient glacial action upon the surfaces of mountains which are composed of the more recent and refractory, intrusive and eruptive rocks, and upon the slates, since the altitude of such mountains is quite as great? The formation of Yo-Semite Valley, like the other cañons, some of them in rock much less susceptible to ordinary chemical action, upon the western flank of the Sierra Nevada, is, no doubt, due to the erosive action of water through long extended periods of time. F. A. H.

SCIENCE IN NAVIGATION.—The New York Herald says a plan has been broached for the establishment of a system of storm signals on the Cape Hatteras lighthouse, by which vessels in sight or hearing can be warned of storms prevailing elsewhere. A line of telegraph is proposed to run from Newbern to Hatteras, by means of which the lighthouse keeper can be informed of storms at any distant part of the coast, and thus communicate by signal flags or cannon the information to passing vessels, who, being forewarned, can be forearmed. It is well known that storms frequently prevail in one direction on the Atlantic while everything is calm in another. It is also proposed to extend these signals to Key West, Fort Taylor, Havana and other points, and it is stated that the expense will be very slight.

LEOAL QUIBBLES.—The Grass Valley National says that John Williams, a Cornishman who stole quartz specimens from the Rush Creek quartz mine, and who was convicted thereof in Sierra County, was released on bail on account of some flaw in the indictment, and will await the action of the next Grand Jury. This case illustrates some of the beauties and consistencies of common law, to wit: The prisoner testifies that he stole the quartz, told where and how he got it, which all went to prove that he did not steal anything. The law is that real estate cannot be stolen, and the counsel for prisoner claimed that the quartz was real estate if taken from the ledge and carried away immediately.

At Louisville, a few days ago, a locomotive was found in the Ohio, where it had fallen in 1864, while being taken over the falls in a flatboat.

A MILLION OF DOLLARS, in gold, weigh 4,479 pounds, or within a fraction of 2½ tons.

## Mechanical.

## The Structure of Iron.

It was made a great objection to the Bessemer iron, when that manufacture was first introduced, that its structure was *crystalline* rather than *fibrous*. The idea was then almost or quite universally entertained that the fibrous nature of iron was its chief element of strength. Later investigations, however, have completely reversed this theory, and proved, beyond a doubt, that the *fiber* of iron is really an element of weakness, and that the best and strongest iron is that which is the most perfectly crystalline.

The fallacy of the former theory grew out of the ignorance with regard to the cause of the "fiber" of iron. It has recently been ascertained that this fibrous condition is due to the presence, in the iron, of foreign matters which are taken up during its manufacture, and which prevent the proper arrangement or adhesion of its particles, however powerfully the metal may be compressed or however carefully it may be twisted, doubled up, etc. The effect of this foreign matter is similar to that which is obtained when a hermetically sealed glass tube is heated, drawn out, doubled up, twisted, etc. However much it may be wrought and worked, it will not part with the air it contains, which in the end will impart to the glass a fibrous appearance, weakening rather than increasing its strength.

A great number of experiments, made by both the French and English, on armor plates, shafts, etc., have definitely settled this question in the manner stated. The intense heat employed in the manufacture softens the scoriaceous matter, but never expels it.

Neither iron nor any other metal is absolutely solid. All are either fibrous or crystalline, and in all their conditions they have void places or cells between their angles or between their fibers. If it were possible to compress any metal into a perfectly solid state, its bulk would be greatly diminished, and its density proportionally increased.

The formation of the *cell*, in crystalline iron appears to take place in the process of cooling, under the double action of the repellent and cohesive forces inherent in the metal. Fluidity is first obtained by the introduction of as much heat as is necessary to properly overcome the cohesive force of the molecules; then in reducing the heat by radiation, the cohesive force again comes into action till an equilibrium is attained, and the mass solidifies into innumerable arches or spherical cells. Important modifications in the cellular formation are obtained as the mass is more or less rapidly cooled.

Fusion seems to be an indispensable condition for the prevention of a laminated or fibrous structure—it is the most ready, and, in fact, the only process by which the iron can be properly freed from its scoria or foreign matter; hence the very objection, at first urged against Bessemer iron, has now been proven to be its most important and useful element.

In iron produced by the Bessemer process, the after use of the roller or hammer imparts new and valuable qualities which cannot be obtained in iron which has been obtained from the ordinary puddling furnace. The one, as is fully proven by a careful examination with the microscope, consists of broken down cells—their angles simply reduced—and the cells elongated; the other presents the usual fibrous structure, once thought so essential to the character of a good iron or steel.

Of course care must be taken in the rolling or hammering of iron to see that a proper degree of heat is employed, for it is well known to those practically acquainted with the manufacture of iron, that a metal of the same degree of chemical purity may produce bars greatly varying in quality, accord-

ing as the heat at which it is worked is greater or less, or the rapidity or slowness of the cooling is regulated. Metal which, worked at the right temperature, will produce good iron or steel, if worked too hot will prove short or brittle.

**PUMPING HOT WATER FOR BOILERS.**—Owen Redmond, of Rochester, writes to the *Scientific American* on the subject of pumping hot water, one of much importance in regard to the safe working of steam engines, etc. It might be considered a matter of course, by many, that if a force pump of given dimensions will inject a certain volume of cold water into a boiler within a stated period and continue to do so uniformly, that the same pump will inject a like quantity of hot water in the same length of time. Mr. Redmond says:

"I am of opinion that somewhere about here lies the key to the solution of so many mishaps in the bursting of steam boilers, and that the explosions generally arise from the want of a sufficient supply of water by the force pump. My theory is that a force pump for water of a high temperature ought to have twice the capacity of that used to pump cold water when the volumes to be pumped are alike, because it is a fact that although water does not boil in an open vessel under 212 degrees, it is quite otherwise in a vacuum or a partial one. Hence, it does appear that in the case of hot water, the moment that the plunger forms the vacuum, just then, the hot water being relieved from pressure, forms into steam more or less and partially fills the pump chamber and thus prevents the regular passage of water through the valve. I therefore conclude that if the water to be injected is of a high and varying temperature its regular flow is not to be depended upon unless the pump be made sufficiently large to contain both water and steam in quantity at the same time, owing to its sudden transition from water, in the supply pipe, to steam, in the vacuum chamber of the pump."

**METALLIC VEGETATION.**—This new chemical toy is founded on the decomposition of a solution of silicate of soda and a metallic salt, such as crystallized chloride of iron, proto-chloride of cobalt, nitrate of uranium, or sulphate of protoxide of manganese. A tumbler having a flat bottom is first filled with silicate of soda of a density equal to 22° Baumé, and then small fragments of a salt are thrown in. After some hours, a miniature forest may be seen, variegated by remarkable forms and most brilliant colors.

**MAGNETISM USED IN MAKING IRON.**—The *London Athenæum* says among the many new applications of electro-magnetism to the arts and manufactures, is that of making it instrumental in the smelting of ore. A fixed electro-magnet is placed opposite an opening in the side of the furnace containing the metal to be smelted, and a current of magnetism is directed on the molten metal. The effect on the iron is said to be very remarkable, rendering it hard and tough. The process is carried on with great success at one of the most important iron works in Sheffield.

**CAST IRON CAR WHEELS.**—An English writer in the *Engineering*, says that wrought iron wheels of the best English make, have been tried again and again on railroads, and abandoned as not being equal in strength and wearing qualities to American cast iron wheels. The cast iron wheel is about one-half heavier than the wrought iron. The American truck wheels are chilled, while the driving wheels have Krupp's steel tyres.

**WATER PROOF OIL.**—W. R. Wyckoff of Ripon, Wis., exhibited at the recent American Institute, in New York, an oil of his manufacture which is designed to render leather water-proof, soft and pliable. It is claimed that leather treated with it will not mold, and that neither rats or vermin will attack it.

**COPPER TUYERES VS. IRON.**—Copper tuyeres have recently been found to last much longer, and to prove upon the whole much more economical than iron tuyeres, especially with hard water. In some experiments recently carried out, iron tuyeres lasted only for about six weeks, sometimes not so many days, while copper lasted for from ten to twelve months, in active use.

## Scientific Miscellany.

**ANIMAL ELECTRICITY A MYTH (?)**.—M. Schultz-Shallenstein has recently published some investigations made by himself with regard to the relation of electricity to muscular action, in which he comes to the conclusion that there is no such thing as electricity in healthy muscle. His novel and startling conclusions are formulated as follows:

1. The supposition that living muscle produces electricity is incorrect. If needles be plunged into the foot of a living animal and be placed in connection with a galvanometer, no deflection of the galvanometer needle occurs.

2. Muscles removed from the body give evidence of electricity, but this is because of the combination of the decomposing tissue with the oxygen of the air.

3. Salt water causes the galvanometer needle to be deflected. This explains why salted meat gives evidence of electricity.

4. The supposed electric current in the human muscle is solely caused by the salt water in contact with the tissue.

5. In deceased structures the electric current is derived from the decomposing tissues.

6. The electricity of the secretions is also derived from the decomposing tissues.

7. Animal electricity is an illusion.

The author has requested the French Academy of Sciences to appoint a commission to witness and report on the experiments upon which his conclusions are based.

**FLUORINE.**—Many attempts have been made to obtain this highly electro-negative element in an isolated condition, but without success. M. Prat now avers that he has isolated fluorine by heating fluoride of lead either with nitrate of potash or binoxide of manganese. The result of this operation is a gaseous mixture of oxygen and fluorine from this the oxygen is obstructed from passing the mixture over the heated oxide of barium. The binoxide of barium is formed while the fluorine is left in the form of a gas. M. Prat says it is colorless, and has an odor resembling chlorine. It decolorizes indigo; reddens litmus; fumes on coming in contact with air; gives dense fumes with ammonia; decomposes water as well as hydrochloric acid; unites with hydrogen in diffuse light, forming hydro-fluoric acid; and last, it combines with all metals, excepting, perhaps, platinum and gold. M. Prat's experiments are to be repeated before a committee from the French Academy of Sciences. He seems to have selected a most direct path to success by first obtaining a mixture of two gases, which, it is well known, do not combine chemically.

**ZINC PAINT.**—An improved metallic zinc paint has been invented by Messrs. Webster, Deane & Rumble, of Birmingham, England. They propose to take spelter and melt it in a suitable furnace, and raise it to about 800° Fah.; they then cover the molten metal with a flux of borax mixed with caustic of soda or chloride of ammonia, or other suitable flux, to prevent the action of the atmosphere upon the surface of the molten zinc; they then add thereto about seven to eight per cent. (or more or less) of finely-divided iron wire or scrap, agitating the whole with an iron rod until the whole of the iron or scrap particles are taken up by the zinc; they then add sufficient antimony to cause the metal to run freely from the furnace. When the metal thus prepared has cooled down it is next pulverized and ground, when it may be mixed with any oleaginous matter or varnish, and the metallic zinc paint results. When the paint is intended to be used for coating ships' bottoms or marine purposes, they add thereto 1½ per cent. or thereabouts, of vermilion or oxide of mercury.

**TO CEMENT STONE TO IRON.**—A German chemist gives the following formula: Six parts Portland cement, one part finely powdered lime, burnt, but not slacked, two parts sand, or part slacked lime mixed with the necessary quantity of water. The sand and iron should each be damped before cementing. In forty-eight hours the cement will be nearly as hard and durable as the stone itself.

**ELECTRICITY IN STEAM BOILERS.**—Dry steam has electric properties; when in a gaseous state it is a non-conductor of electricity. The electric discharges which may be obtained from dry steam, are supposed to attend the process of condensation. A small steam boiler, insulated upon a glass plate, and under considerable pressure of steam, may be made to deliver continuous electric flashes.

**THE INTERNAL HEAT OF THE EARTH.**—Dr. Julius Sebavarez read a paper on this subject before the British Association, in which he concludes that the different corollaries of the central-fire doctrine were not adequate to explain the different groups of natural phenomena for the sake of which these corollaries were deemed essential 50 years ago. He adds some suggestions as to how experiments should be made in order to ascertain the temperature of the earth at different depths, simultaneously in different quarters of the globe. Sir Charles Lyell said he was glad to know that the subject of underground temperature was to be taken up at the expense of the British Association. He had long been convinced that, so far as the evidence now goes, there is an increase of temperature very generally as we descend from the surface of the earth as far into the interior as we can enter, but it is a mistake to suppose that the best observations indicate a uniform increase. That, he believed, would be one of the results of the inquiry, but it would also be a great point to ascertain what was the amount of difference of temperature at different places.

**EXPLOSION EXPERIMENT.**—The *Paris Cosmos* describes an interesting experiment which may be new to many of our readers. A large bell-glass full of air is placed over water, and a stream of mixed air and hydrogen gas is slowly sent up through the water, so that each bubble of gas, as it escapes, meets the point of a Ruhmkorff coil, and is ignited by the spark. The result is not a sudden explosion, but a succession of lighted bubbles, which continue their course within the bell-glass, describing a series of curves. The effect is most brilliant when the experiment is performed in the dark, the small flames then darting about and crossing each other's track in all directions, give the appearance of a bell-glass filled with fire-flies.

**THE SLAUGHTER OF CATTLE.**—A series of experiments took place lately in Paris with a view to try whether cattle might not be spared the frightful tortures it is supposed they endure on being felled with sledge hammers. Physiologists had affirmed that the severing of the spine will strike the animal down as if by lightning, but the experiments have not corroborated this opinion. Oxen not only showed signs of life, but gave evidence of suffering for more than fifteen minutes after this operation. Experiments were tried on sheep and calves with a similar result.

**ANATOMICAL PREPARATIONS.**—Glycerine has been found to be a valuable ingredient in preventing putrefaction. The subject to be preserved is immersed in a mixture of fourteen parts of glycerine, two parts of brown sugar and one part of nitrate of potash, until a slight deposit begins to be formed in the bottom of the vessel. When removed from the solution the muscles and articulations are perfectly rigid, but they will recover their pliancy after exposure to warm, dry air.

The diameter of the earth, multiplied by one hundred and eight, gives the diameter of the sun; the diameter of the sun multiplied by one hundred and eight, gives the mean distance of the earth from the sun; and the diameter of the moon multiplied by one hundred and eight, gives the mean distance of the moon from the earth.

**THUNDER MADE VISIBLE.**—Dr. Töpler focalizes a ray of light on the object glass of a telescope, which is connected in such a way that any disturbance of the air becomes visible; for instance, the intense, sonorous vibrations of the atmosphere produced by electric explosion show themselves in the telescope as visible rings or circles of light.

**IMPROVED INSULATOR.**—A new insulator for telegraphic purposes has been brought out in Philadelphia, which consists in giving the ordinary sulphur and glass insulator a coating of paraffine; this being a thorough repellent of water, is found to make the insulator more perfect in wet weather.

A PERFECT LUBRICATING OIL should have just sufficient viscosity to keep the axle and bearing from coming in contact, should be unaffected in consistency by changes in temperature, should not be volatile, and should not change from chemical causes.

**THE COLOR OF MARS.**—Mr. Huggins, F. R. S., is of opinion that the color of the planet Mars, is not due to the peculiar absorption or other effects of its atmosphere, but that the color has its origin in the material of which some of the planet's surface is composed.

## New Patents and Inventions.

Under this heading we shall mention, from week to week as occasion may demand New and Important Inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent Issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

## RECENT INVENTIONS.

**A CARPET STRETCHER** is among the latest novelties of invention at the east. It was recently exhibited before the American Institute, at New York, when it was highly spoken of. It is for tacking down and stretching carpets. It is made of wood and metal; is about the size and length of a broom handle. A small tin pipe runs down along side of the stick to a small iron mouth at the bottom, where there is a spring hammer and a piece of iron with teeth which takes hold of the carpet. The operator stands, putting the tacks in the small pipe at the top, and placing the "teeth" on the edge of the carpet and stretching it as necessary, then pulls a string, the hammer goes down, and the tack is in. The machine is very simple, and costs \$4 at retail. This seems to be just the thing needed for housekeepers, who propose to let their carpets remain down longer than they should do, on account of the hack-breaking operation of stretching and tacking them down again. With this instrument, such work will be pastime. If it is not a "big thing on the carpet," it is certainly a valuable little one, and one which will call forth many thanks from weak-backed mothers and daughters.

## PATENTS RECENTLY ISSUED.

**70,121.—LIFE-PRESERVER.**—Reuel Robinson San Francisco, Cal.

I claim the frame, A, provided with airtight compartments, and a flexible case for the legs, body and arms, and having a seat, D, and opening, F, all substantially as described.

The object of this invention is to provide a life-preserver or boat for vessels, so constructed that it will not occupy the space required for freight or other purposes, and furnish to each person a simple and complete life-boat and armor combined, in which one having provisions can live at sea for an indefinite time, and so have a safe and ready means of escape from the ship in case of wreck.

To do this the inventor constructs a raft or float, of sufficient depth to give it the required buoyancy and strength, say six feet long by two feet wide, and four inches deep, more or less with water tight compartments. Through the center of this an opening is made about four feet long, sharp at each end, and twenty inches wide at the middle; in this raft is placed an armor to fit it, made of water proof material, about 20 inches deep, with a narrow piece or strip of wood or other material at the bottom. This armor is secured to the sides of the opening. Legs are attached below. Conveniences are affixed for paddling and receptacles for food and drink. It may be conveniently placed in the bottom of a berth, so as to not to occupy room which might be otherwise needed. The individual sits astride very much as if upon a saddle. As nearly the entire weight of the person is placed below the main bearings, it can be capsized only with great difficulty, and the person is readily adjusted again by his own specific gravity; being securely attached to the raft, by means of straps, etc.

**70,126.—GRAIN ELEVATOR AND FEEDER.**—Benjamin F. Sherman, San Francisco, Cal.

I claim, 1st, The elevator-feeder described, arranged at the lower end of the elevator, and operated by the gear, D, on the lower pulley-shaft of the elevating-belt, in combination with the gears, E, F, and G, so constructed and arranged that the feeder may be swung around in the arc of a circle to bring it to the grain to be fed to the elevator.

2d, Lengthening or shortening the saw-feeder by taking out or putting in the extension pieces, H' and H, substantially as described.

The object of this invention is to provide a feeder for the common grain elevator, so arranged that when the grain is removed by it, a sufficient quantity may be brought within easy reach of the common elevator, without the aid of man power; also so constructed that it may be lengthened and extended to any part of the storehouse or vessel.

For the accomplishment of this object, the inventor attaches to the ordinary elevator-case, by means of brackets, a yoke,

Through this yoke is placed a shaft, to which, by means of bevel-gearing, the elevator and his improvement are connected. Adjustable extension pieces for lengthening or shortening the feeder, are placed along each side of the case, which may be taken out or put in at pleasure. It is claimed by the inventor that with this improvement, much time and expense will be saved in discharging ships, as well as in emptying storehouses.

**70,130.—MEANS FOR PROPELLING VESSELS.**

R. R. Stevens, Mokelumne Hill, Cal.

I claim the combination and arrangement of the cams, D, D, and D', D', with the frames, H and G, and cranks, F and F', constructed and arranged to operate the paddles, P, as described.

The design of this invention is to provide a paddle or paddles for steam vessels, which shall combine a powerful means of propulsion, with the avoidance of the dead weight and lifting or hacking of water inseparable from the ordinary paddle wheels, and by which a large amount of power is lost.

To accomplish this object a frame of wood or other material is constructed at the sides of the vessel in which the paddles are placed, which consists of two smaller iron frames upon each side, supported by suitable shafts placed across the under frame, the two iron frames being connected by double eccentrics or cams, with crank shafts operating in gears. These cranks connect at each end to a double piston rod, the paddles being vertically attached to upright bars, which extend up through the iron frames.

The inventor, in making his claims, admits that vertical paddles are known, and that attempts have been made to use them in certain forms for propelling vessels; but by certain defects in their application to the machinery, and a want of parallelism and certainty of action, they have thus far been practically useless.

**70,101.—SYPHON PROPELLER.**—John Marquis, San Francisco, Cal.

I claim the propelling of a vessel by water raised to any height that can be acquired by means of steam or hot-air siphon, or its equivalent, the fall of the water from the height being the propelling power, either by its own weight or velocity, or pressure, substantially as described.

The design of this invention is to provide the means of propelling a vessel through the water without the aid of the ordinary steam engine, paddles and machinery now in use; and consists in elevating the water to a certain height above the water line of the vessel, and allowing it to descend upon the surface of the water in the vessel which floats. In order to accomplish this, the inventor employs a steam-siphon, consisting of a pipe placed transversely across the vessel, abaft of midships, with radial arms attached to each end, and extending down upon each side of the vessel, to near the surface of the water. A vertical pipe is attached to the transverse pipe near the center, which descends to the water through the vessel, passing through an inverted trough above the keel, an opening or well being made in the bottom of the vessel, corresponding to the size of the trough. In front of the vertical pipe is placed the engine and boiler for steam or hot air of sufficient capacity for operating the siphon. A small pipe leads from the boiler or hot-air chamber of the engine to the vertical pipe, regulated by a valve or valves. The vacuum created will raise the water to the desired height, and it will descend in the opposite direction by gravity, with a force equal to its height and velocity. The principle is similar to that employed in the late English experiments on the Water Witch; with the important difference in its application, that Mr. Marquis employs direct action of steam through a steam siphon to raise the water, while in the Water Witch experiments a turbine wheel was used, necessitating the employment of a steam engine. No engine is required by Mr. Marquis' plan—all that is needed is a boiler and a few feet of steam pipe.

**IMPORTANT TO INVENTORS.**—Young's patent for distilling coal oil, was opposed on the ground that the process had long been known in laboratories, where it was often practiced on a small scale as a mere experiment. It was decided that such use was no bar to a patent, inasmuch as Young was the first to make it a really practical process, and of value to the public.

## American Mining Machinery in Europe.

AN AMERICAN ROCK DRILLING MACHINE TAKES THE HIGHEST PRIZE AT THE PARIS EXPOSITION.

The depressed condition of the mining interest in Great Britain, growing out of the great depth at which explorations have to be made there, the recent general movements for the advance of wages, and the important mining developments now being made in this country, has of late greatly exercised our English consuls. Prices of stocks have fallen, very materially, and destitution and dismay are beginning to appear in many sections of the mining region.

In casting about for relief, there appears to be no prospect of deliverance from the impending disaster, except in the introduction of new and improved machinery, to reduce the cost of mining. Proceeding upon that supposition, the English "Miner's Associations," acting in concert with others equally interested, sent two of their most competent experts—Dr. C. L. Foster and Mr. Chas. Fox—to examine and report upon the mining machinery which should be exhibited at the Paris Exposition. These gentlemen were also instructed to visit such other localities as would be likely to furnish them with practical information with regard to the object of their mission. In accordance with the latter instruction, Dr. Foster visited the mines of Sweden, and Mr. Fox went to Mount Cenis to examine into the working of the tunneling machinery employed there. The result of their examinations and conclusions have not yet been made public.

One important fact, however, in this direction, has been brought to our notice, through a correspondent of the *American Artisan*, writing from England, which will doubtless also find a prominent place in the report of the experts above alluded to.

It appears that the United States, was unofficially represented at Paris in this particular, by General Herman Haupt, of Philadelphia, who took over and exhibited a machine and system of mining, which was placed in the Exhibition in competition with the best machinery of Europe. The result of this exhibition was that the American General carried off the highest prize in his line of exhibit, with an expression of opinion from the judges that his machine and system of mining was not only the best, but the only one that was applicable to all kinds of mining, shafting and tunneling operations!

In addition to the above, we are further informed that the fame of this American machine had been brought to the notice of a Mr. Loam, a practical mining engineer of great reputation in Cornwall, who went to Paris especially to examine Gen. Haupt's machine. He appears to have expressed much confidence in the same after his return, and declared that "that American machine will work anywhere."

Be that as it may, there is no doubt but this "American Machine" has carried off the highest honors over any other machine known in Europe, not forgetting the famous machinery which has been so long employed at Mount Cenis. We infer that the machine especially referred to is a drilling machine, of superior construction and efficiency, capable of being applied to working either in hard rock or for cutting out coal. [This machine is referred to in the letter of our Paris correspondent, which appears to-day, received since this article was written.]

The peculiarities of the machine appear to consist in its lightness and small size, and the facility with which the drill can be changed and the machine itself operated. The cylinder, which gives the reciprocating movement is stationary, while the drill tool advances, the feed being automatic. The drilling engines weigh only about 125 pounds each; and three or four of these can be mounted on a pair of hollow columns, only four inches in diameter, placed ten inches apart, resting on a base only eight inches in diameter, and fixed firmly in the rock by

two large and stiff screws, arranged much like jack-screws.

It does not appear that the machine has been introduced to any extent into use in the United States or elsewhere, although it is somewhat known at the East. It is said that it would have been introduced into the Hoosac Tunnel, but for some personal antagonism between the inventor and those in charge of affairs there. We have made arrangements to learn further particulars with regard to this invention, and hope soon to be able to lay something further, with regard to it, before our readers.

**NEW RELIGIOUS PERIODICALS.**—We have before us the prospectus of "THE OCCIDENT," the first number of which will be issued by H. H. Bancroft & Co., as publishers, January 3d, 1868. This paper is to be established as the especial organ and representative of the Presbyterian organization on this coast. It will be published weekly, under the editorial management of Rev. James Eells, with Rev. E. B. Walsworth, as associate.

"THE SPARE HOUR," is the name of another religious periodical, the initial number of which will make its appearance about the 10th of December. It will be under the editorial charge of Rev. H. A. Sawtelle, and will be published as the organ and representative of the Baptist (open communion) interest on this coast. The open communion Baptists, as they are called, are identical in practice and belief with Mr. Spurgeon, and the great mass of Baptists in England, and differ from the regular Baptists only on the point of communion—the former communing with all evangelical churches, while the latter commune only among themselves.

**RIGHTS OF STOCKHOLDERS.**—Two cases were recently brought before Judge Sutherland, of the N. Y. Supreme Court, involving the right of stockholders to inspect corporation books, a privilege denied by the officers. In both cases the court granted its writ of *mandamus* commanding the officers to submit the company's books (leave to examine stock was prayed for) for inspection. The Judge intimated that the right of a shareholder to examine the books of his company existed at common law in the absence of any statute.

MR. C. T. RANEY, of the Railroad Depot Book and Periodical Store, Sacramento, is our duly authorized agent for that county. Members of the Legislature, and others who may wish for copies of the PRESS, will find a supply at the above place constantly on hand, in convenient wrappers for mailing.

It is said that an American house recently sent 500 hoop skirts to Japan, as a venture. The Japs put a cover on them and use them as umbrellas.

MARKET STREET HOMESTEAD ASSOCIATION.—J. S. LUTY, Secretary. Office, 305 Montgomery street, corner of Pine, San Francisco. 2v15f

BUSINESS NOTICE.—Mr. A. T. Dewey, of this journal, contemplates a visit of several months in the Atlantic States, a portion of which time he will spend in Washington, New York and Boston. Any of our Eastern friends who wish to communicate with him, for business or other purposes, will address their letters to "Westfield, Mass."

JACOB SHAW, Pioneer Photographer, 612 Clay street, north side, four doors above Montgomery, (late 315 Montgomery street), takes all kinds of Photographs in the best style of the Art. He would invite especial attention to the new "Cabinet Photographs," which he is taking to perfection. 10v14f

SECRETARYSHIP FOR MINING COMPANIES.—A gentleman of education, ability and experience, is desirous of procuring a position as Secretary, or Assistant Secretary, in some good Mining Company. Has most unexceptionable references. Address "SECRETARY," at this office. 6v15f

CO-OPERATIVE UNION STORE.—This is becoming one of the most useful institutions in the city, and the Mechanic and Laboring Man fully appreciate it. They are now enabled to buy their Groceries and Provisions twenty per cent. cheaper than ever before, and the very best articles in market. The store is located at 115 Sutter street, Lick House Block. 2v15f

Save Your Teeth.—Do not have them extracted without first consulting a good Dentist. The loss is irreparable, and, in many instances, unnecessary. DR. BEERS, corner of Pine and Kearny streets, makes a specialty of filling the fangs of dead Teeth, and building up broken crowns with *pearl cement*—thus restoring them to their original usefulness and beauty.

Call and examine the work. Finest quality of artificial work also manufactured. 16v14f

Weekly Stock Circular.

Of Associated Brokers of the S. F. Stock and Exchange Board.

SAN FRANCISCO, SATURDAY MORNING, November 30, 1887.

CITY STOCKS.

Transactions in city shares have been quite limited during the past week. We note sales of Pacific Insurance Co. stock at \$116 per share, and California Steam Navigation Co. at 7 3/4 cent. Sutter Street Railroad sold at \$20. At the close considerable sales of San Francisco Gas Co. and Spring Valley Water Co. were made at \$66 and \$91.50 respectively, the latter closing at \$90.50 seller.

We are informed, says the Bulletin, that the People's Fire and Marine Insurance Company, recently incorporated with a capital of \$100,000, having complied with the law by calling in twenty-five per cent, or \$25,000, will commence the issuance of policies on Monday, December 2d. The general officers of this company are as follows: President, C. F. McDermott; Vice President, John H. Wise; Secretary, John Fowler; General Agent, J. G. Taylor. This organization will swell the number of our local insurance companies to eleven, having an aggregate capital of \$5,700,000.

The receipts of the local insurance companies during the first ten months of 1887, according to the returns made to the Internal Revenue Department, have been as follows:

Table with 3 columns: COMPANIES, October, and Total. Lists various insurance companies and their respective earnings for October and total for the year.

The returns were made upon a ledger basis, the rate being fixed every month by the Collector of the district, as follows: In January, 7 1/2%; February, 5 1/2%; March, 5%; April, 5%; May, 7%; June, 7%; July, 7 1/2%; August, 7 1/2%; September, 7%; October, 7 1/2%.

The aggregate increase of receipts in October as against September is \$1,767. The receipts of the several companies in October as compared with September, show the following difference:

Table with 3 columns: COMPANIES, Increase, and Decrease. Shows the change in receipts for various companies from September to October.

From the foregoing statistics it will be seen that the more business our insurance offices do, the greater will be their loss. Let us exemplify. The publication of a penny newspaper accomplishes a general good; but it is obvious that if the paper cost three quarters of a cent, and the printing, pressing and other expenses involve three quarters of a cent more, the publisher is out of pocket one half cent for each paper circulated. But this loss is made up by more extensive circulation, and the greater inducement for advertising patronage, which is relied upon as the only profitable resource of the journal. This resource does not exist in insurance offices, and if they continue to do business at present rates, where is their "advertising patronage" to come from? It is quite evident that the company which does the least business is best off, at the present writing. The low rates, the high risks, and the rule or ruin competition which has been inaugurated are fast sapping the foundations of our staunchest and most reliable insurance companies, without giving better guarantees to property holders, or affording as sufficient safeguards against the wanton and criminal destruction of their property. While admitting that competition is the "life of trade," we can not reason ourselves into the opinion that the adage holds good in all cases. The insurance business is exceptional, and can not be "run into the ground" with profit to the parties undertaking that exploit, or benefit to the insured.

The receipts of the city railroads for the month of October, and previously this year have been as follows:

Table with 3 columns: October, Previously this year, and Total. Compares October receipts with the same month of the previous year and the total for the year.

The aggregate increase of receipts in October over September is very small, amounting to only \$624. The difference of the income of the several companies in October as compared with September is as follows:

Table with 3 columns: Increase, Decrease. Shows the change in receipts for various companies from September to October.

Although the several city railroads are in a prosperous condition, no dividends have been disbursed for some time, the North Beach and Mission road so late as August last, and the Omnibus and Central companies in September. Constant improvements and extensions have been a heavy drain upon their surplus earnings.

The State Board of Examiners, at their meeting on the 19th of November, in Sacramento, opened the bids for the sale of California State Bonds. The proposals were as follows: Woode & Chosman, \$6,000, at 93 cents; L. H. Fuller, \$1,000, at 90 cents; L. & S. Wormer, entire amount, at 98 cents; Joseph S. Paxson, of San Francisco, at 95 cents. These bids were all for the face value of the bonds, exclusive of accrued interest. The Board awarded to L. H. Fuller the amount bid by him, and to Joseph S. Paxson the balance of the amount advertised for. The amount of money on hand yielded bonds as follows: For State School Fund, \$20,000; for Seminary Fund, \$2,500.

Mining Share Market.

The general list of mining stocks during the past week shows a very material appreciation over prices that have ruled for some time past, the upward tendency having been gradual and without any undue excitement on the part of speculators. The enhanced value of Imperial seems to have been the initiatory step towards a sympathetic feeling; however, the intrinsic merits of the advance is warranted in a number of cases. All things considered, the present condition of the mines on the Comstock Lode is much better than was anticipated less than a month ago.

CROWN POINT—was in better request, advancing from \$30 to \$70, receding to \$50, and closing at \$53.5. The latest advices state that in the north drift, on the 700-foot level, they are nine feet in the face from where they cut quartz and pay ore on the 22d instant, and now continue in quartz with spots of pay. It is said that about seven feet of the ground will yield \$35 per ton at the mill. The south drift runs in porphyry and quartz.

HALE & NORCROSS—continues to be well maintained, selling at \$300 per share, and closing on Wednesday at \$291. The vein running toward the Savage ground, fifty feet below

the 700-foot level, is about ten feet wide, and produces an average yield of \$34 to the ton. The general average product of this mine during the current month runs a little less than \$40 per ton. At a meeting of the stockholders of this company, held on the 27th instant, seven hundred and twenty-four out of the eight hundred shares being represented, it was unanimously voted that the value of the shares be increased from \$50 to \$100 each, making the capital \$1,000,000. This increase will enable them to levy a larger assessment—which will be done very shortly—than could have been made with a capital of only \$500,000.

KENTUCK—has been somewhat inactive during the period under review, closing at \$14 to \$15. It is estimated by parties experienced in mining that this west body of ore, mined as it is the present month, will last for eight months. The future of the mine, however, dependent upon the east body, particularly by the Crown Point and Yellow Jacket Companies, and lying about four hundred feet to the east of the Kentucky shaft. The lowest level of the Crown Point, 600 feet in three hundred feet below the lowest level of the Kentucky; and the north drift in the former mine is being run jointly by the two companies, and on the dividing line. According to the report of the Superintendent of the Crown Point, the vein in the 22d instant, ran through ore in this drift which, if concentrated, would make a compact body of eleven feet; since which time the drift has improved in going east, and is now in pay ore. This east body of ore, at the 150-foot level, is estimated by parties experienced in mining that this west body of ore, mined as it is the present month, will last for eight months.

The future of the mine, however, dependent upon the east body, particularly by the Crown Point and Yellow Jacket Companies, and lying about four hundred feet to the east of the Kentucky shaft. This east body of ore, at the 150-foot level, is estimated by parties experienced in mining that this west body of ore, mined as it is the present month, will last for eight months. The future of the mine, however, dependent upon the east body, particularly by the Crown Point and Yellow Jacket Companies, and lying about four hundred feet to the east of the Kentucky shaft. The lowest level of the Crown Point, 600 feet in three hundred feet below the lowest level of the Kentucky; and the north drift in the former mine is being run jointly by the two companies, and on the dividing line. According to the report of the Superintendent of the Crown Point, the vein in the 22d instant, ran through ore in this drift which, if concentrated, would make a compact body of eleven feet; since which time the drift has improved in going east, and is now in pay ore. This east body of ore, at the 150-foot level, is estimated by parties experienced in mining that this west body of ore, mined as it is the present month, will last for eight months.

The Secretary submitted the following report, extending from November 1st, 1885 to November 21st, 1887:

Table with 2 columns: Receipts and Disbursements. Shows financial details for the period from November 1st, 1885 to November 21st, 1887.

One statement from May 1st to November 1st, 1887: Tons worked, 15,844 1/2; average yield of hullion per ton, \$43.86; average cost of mining and milling per ton, \$24.72; average net yield per ton, \$19.14.

SAVAGE—continues to be actively dealt in and at better prices, advancing to \$112.50, then selling at \$108.50, and closing at \$104. The ore is said to be better than the ore extracted during the past six weeks as compared with the following information:

Table with 3 columns: Date, Tons, and Value per Ton. Shows production data for Savage mine from November 23rd to October 19th.

The north mine, on the third instant, continues to produce the largest amount, having yielded 885 tons of the aggregate reported for week under review. Dispatches of the 27th state that the south drift, on the fourth instant, passed the 200-foot level, and is said to be better than the ore to the south to reach the drift from the winze. In the east drift, from same winze, the ore is said to be fourteen feet wide. It is reported that all parts of the mine have generally improved in quality.

CHOLLER-POTOSI—met with moderate sales at \$120@121, rose to \$123 and closed at \$123. The ore is said to be better than the following information: On the third instant a shaft, at the south end, a fine body of ore comes in; it is said to be thirty-five feet wide, showing large assays. The deposit is in the 300-foot level, and is said to be better than the ore toward a large body of ore. The old mine yielded 1,700 tons of ore during the week ending Nov. 22d, and 1,647 tons were sent to custom mills during the same period. On the 24th inst, 268 tons were ordered to custom mills.

IMPERIAL—is in marked favor, advancing from \$188 to \$194, then selling at \$184, and closing at \$175. The bullion receipts during the current month—three shipments from Rock Point Mill and one from Gold Hill Mill—amount to \$25,368. The mines of this company have yielded a total of ore of 100,000 tons. A test has been made of the machinery at the Imperial-Empire shaft, and everything is found to work satisfactorily.

OVERMAN—declined from \$49 to \$43, rose to \$46.50, and closed at \$45. On the 24th inst. they commenced drifting at the 300-foot level, and a smaller quantity of ore is now extracted, and of an inferior quality. The receipts of bullion so far this month aggregate about \$7,000.

GOLD HILL QUARTZ—advanced from \$110 to \$132.50. YELLOW JACKET rose from \$405 to \$315, closing at \$290. ALPHA is quotable at \$400 per foot. An assessment of \$10 per share, or \$40 per foot, was levied on the 15th instant.

The aggregate sales of Stocks, Legal Tender Notes, etc., at the regular sessions, since the 22d instant, amount to \$284,070. The sales in the open session amounted to \$188,864, showing a combined aggregate to date during the past week of \$1,082,934.

IMPROVED BOILER-MAKING.—Unusual interest is manifested in our Eastern cities in various improved methods of constructing boilers for generating steam economically. Messrs. Conner & Bros., at Wilmington, Delaware, are manufacturing, under their own patent, a very compact boiler, consisting of coils of tubes placed near the furnace, connected with upright tubes in the upper portion, so arranged as to cause a free circulation of water, and greatly economize the heat with perfect security. An engraving, which is necessary to illustrate the device, may be given in a future number.

DR. LIVINGSTONE ALIVE.—Late telegraphic advices state, on what appears to be perfectly authentic evidence, that the distinguished African explorer, Dr. Livingstone, is still alive and prosecuting his researches with as much energy as ever.

MINING SHAREHOLDERS' DIRECTORY.

(Compiled for every issue, from advertisements in the Mining and Scientific Press and other San Francisco Journals.)

Containing the Names of Companies, District or Name of Location; Amount and date of Assessment; Date of Meeting; Day of Delinquent Sale; and Amount and Time of Payment of Dividends.

Large table listing mining companies, their locations, assessment amounts, and meeting dates. Includes companies like Alpha, Bullion, Crown Point, etc.

\*Those marked with an asterisk (\*) are advertised in this journal.

Latest Stock Prices Bid and Asked.

S. F. STOCK AND EXCHANGE BOARD.

Table of stock prices for various companies and bonds, including United States 7 1/2% Bonds, California State Bonds, etc.

GAS COMPANIES.

Table listing gas companies and their stock prices.

RAILROADS.

Table listing railroad companies and their stock prices.

BANKING INSTITUTIONS.

Table listing banking institutions and their stock prices.

INSURANCE COMPANIES.

Table listing insurance companies and their stock prices.

MINING STOCKS—WASHER DISTRICT.

Table listing mining stocks in the washer district, including Alpha, Bullion, etc.

San Francisco Market Rates.

Wholesale Prices.

Table of wholesale prices for various commodities like flour, sugar, etc.

GROCERIES, ETC.

Table listing grocery items and their prices.

Table listing various goods like Do. Rio, Tea, Japan, etc. and their prices.

Retail Prices.

Table listing retail prices for items like Butter, Cheese, Eggs, etc.

New Incorporations.—Articles of incorporation have recently been filed in the County Clerk's office in this city as follows:

GARDENVILLE HOMESTEAD ASSOCIATION.—San Francisco, Nov. 21st. Capital stock, \$36,565; 103 shares, \$355 each. Trustees: Henry F. Williams, Samuel Gilmore, J. Fisher Smith, H. S. King and C. F. Parker.

ELECTION OF OFFICERS.—GARDENVILLE HOMESTEAD ASSOCIATION.—San Francisco, Nov. 21st. Samuel Gilmore, President; C. F. Parker, Vice-President; Henry F. Williams, Treasurer; and A. S. Gould, Secretary.

SHOEMAKERS' CO-OPERATIVE UNION.—San Francisco, Nov. 23d. W. F. Mcagher, President; James Beech, Vice President; Elliott Wescott, Secretary; John Kinsella, W. F. Mcagher, J. Hogan, A. B. Pinstone, James Beech, Trustees.

QUAIL HILL M. & WATER CO.—San Francisco, Nov. 23d. Trustees: George W. Beaver, A. J. Poss, W. E. Dean; President, George W. Beaver; Secretary, T. W. Colburn; Superintendent, Shorman Day. Office, 402 Montgomery street.

Valuable Books on Mining, Mineralogy, Geology, Metallurgy, Etc.

Large table listing various books for sale, including 'ANSTED'S Gold Seekers Manual', 'ANTISELL—The Manufacture of Photogenic or Hydro-Carbon Oils', etc.

DEWEY & Co., Mining and Scientific Press Office, San Francisco. 14713-14mf

## Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

## CALIFORNIA.

## Alpine County.

*Miner*, Nov. 16th: The plan of operations at the Morning Star mine will be radically changed, and a shaft sunk upon the ore deposit now opened, 100 ft.

The north drift in the Tarshish mine is now in good ore, and promises well.

The Glohe Co. on the Hercules lode are pushing their tunnel ahead.

Large quantities of rock from the croppings of the Leviathan Co's mine exhibits true gold-bearing indications. Some of it, pulverized, gave several colors to a pound of rock.

*Chronicle*, Nov. 16th: The last steamer brought out the agent of the Imperial Silver Quarries Co. of London, and work will be commenced before long on the Michigan Tunnel.

## Amador County.

*Ledger*, Nov. 23d: Mining in Alpine county is at last to be commenced in good earnest. We notice that several capitalists have recently arrived there from the East and Europe, who will at once commence vigorous operations.

*Dispatch*, Nov. 23d: The astrata at French Hill is able to crush three tons of rock in 24 hours. The first clean up, on ore from Brumel & Lockwood's claim on the Mother Quartz lode, paid \$9 per ton.

## Butte County.

*Oroville Record*, Nov. 23d: Copper ore of a very rich quality has been struck in this county, and from the specimens now on our desk, it is unexcelled in richness by any in the State.

## Calaveras County.

*Chronicle*, Nov. 23d: Bates, Redfern & Co. are prospecting a very promising lead in the Middle Bar District. Wesson & Co., whose claim is located in the same vicinity, are progressing rapidly in its development, and obtaining the most flattering prospects. The mine of Alexander, Seavers & Co., upon which a 10-stamp mill has been erected, is paying handsome dividends. Staples, Norton & Co., who have purchased a claim on the old Rich Gulch vein, are making preparations for the erection of a 20-stamp mill. Mitchell & Co., located at the junction, have contracted for the hauling of 100 tons of rock to the French mill at Rich Gulch.

At Railroad Flat, Hephurn & Co's mill is crushing some of the richest rock ever discovered in this part of the State.

The West Point correspondent of the San Andreas Register of Nov. 23d, says: The mining prospects of our district continue good. The Casner Bros. have just got into the Zacatara mine with their lowest tunnel, which taps the mine 140 feet below the surface. At this depth the ore is much richer than any hitherto taken from the mine—prospecting \$150 to the ton in free gold. At the Gouldson mine, they are taking out a large quantity of rich ore. Mr. Lasey expects to have his chlorination works in operation by the middle of next month. In the meantime he is vigorously prosecuting work on his mine at Valentine Hill, and is raising a large amount of ore. Widderholt & Co., on Soap Root Gulch, are sinking on their mine, which will in a short time pass into the hands of a San Francisco Co. Sixteen hundred pounds of ore from the Heckendorn mine, at Blue Mountain, crushed by White & Bro., at the Harris mill, last week, yielded at the rate of \$20 per ton in free gold, working through a common battery, and \$26 per ton from the tailings, worked through White's Aetna Calcining Furnace, making a total yield of \$46 per ton.

## Mariposa County.

*Mail*, Nov. 23d: Mr. J. Hambleton has purchased the Guadalupe mill and premises. He has reconstructed the mill and built a new water wheel of 29 feet 5 inches diameter, which will run a battery of four stamps, and arastra.

The mining interests of Coulterville are in a promising condition. McKee & Flanagan, on Bean's Creek, will start their mill within the week. This is a new mining enterprise. They have ready for crushing about 600 tons of ore. They have a mill of eight stamps. Peter Wyuants, on the North Fork of the Merced, is completing a new mill, to be run by water-power. The machinery will start within a week or ten days. Mr. Coward is putting up a 10-stamp mill on the same stream, which is nearly ready to work. The Coulterville Co. are sinking on the main lead, and are down 70 feet. This company proposes to erect a mill if the rock holds out. The French Co. are sinking on the Malvina vein, and are down 180 feet below the tunnel. The rock found and taken out promises to pay well.

Ores from the Josephine and Pine Tree mines which, under the old processes, yielded \$10 per ton, are now yielding, at the Bear Valley mill, under the Ryerson Dry Crushing process, \$40 to \$75 per ton.

## Nevada County.

*Transcript*, Nov. 22d: The storm has supplied the miners in every part of the county with plenty of water for washing, and unless we have a very long interval between this and the next rain, the mining season may be considered fairly commenced. The season opens more auspiciously for miners than any previous one for many years.

The North Bloomfield Gravel Co. are running a tunnel and deep cut for the purpose of opening a gravel range near Bloomfield, and they are working out their ground as the tunnel progresses.

Yesterday the Sprug Slide Gravel mining claim was purchased by Mr. Ragon by Dr. Farnham for \$21,000. The claim is located on the north bank of the North Fork of Deer Creek and about 11 miles north of Nevada. He will immediately open the ground which he has purchased and commence washing this season.

Nov. 23d: The Brown claim at You Bet, which was offered last spring for \$40,000, cannot now be bought for \$100,000. The average yield is \$2,500 per week.

Nov. 24th: Osear Maltman has recently greatly improved his sulphuret works, on the Grass Valley road. He treats sulphurets by the chlorine process, and has been exceedingly successful with all classes of sulphurets. The capacity of the works has heretofore been only about eight tons per week, but he is now building a furnace which will easily reduce 18 tons per week.

*Gazette*, Nov. 21st: A clean up of \$5,000 was made in the San Joaquin claims, at Birehville, on Saturday last, after a run of two weeks. The ground is now being worked by a party of Chinese, who have made a conditional purchase. They use 350 inches of water.

The Eureka Mining Co. have just declared a monthly dividend of \$20,000, carrying over a surplus of \$30,000. The North Star Co. have declared a dividend of \$10,000.

A company has been formed and arrangements perfected to run a tunnel into Gold Ridge, the main divide between the sources of Bear river and the South Yuba. The tunnel will start in near the head of Scotchman's Creek, and the projectors expect to have to run 300 ft. to get through the rim rock.

Nov. 22d: Remarkably rich prospects are now being obtained in the gravel claim of the Chalk Bluff Fine Gravel Co. near the Cascades. They find considerable coarse gold, nuggets having been picked up on the bed rock of the value of \$5. At no distant day they will be compelled to erect one or more mills to crush the cement, but the loose gravel will be washed in sluices and the tailings will be saved and re-worked another season. In the claims of the Red Diamond Co., near by, the prospects are equally as favorable.

The new mill of the Norridgewoek Co. is completed, and was started in operation last Tuesday. The mill has 10 stamps, and the machinery works finely.

Grass Valley National, Nov. 21st: Prospects in the Slate Ledge, between Perrin's crossing of Wolf Creek and Forest Springs, are flattering. One hundred and fifty tons of rock from Oshorue Hill, being crushed at the Orleans mill, will yield between \$80 and \$90 to the ton, and a crushing from the Union Jack mine at the same mill, yielded clear of all expenses \$23 per ton.

The Dromedary Co. have struck a ledge averaging from 8 to 15 inches in thickness, which in its general character gives evidence of being richer than anything yet struck in the mine.

Nov. 22d: Aaron Clark, picked up a specimen on Pike Flat, this morning, equal in value to \$100 in coin.

The miners are turning their attention to placer mining. Large sums of money have been taken from Alta Hill by the companies working them in times gone by, and we learn that Messrs. Early & Walker are now engaged in hydraulic washing the face of Alta Hill, and have a lead of gravel which bids fair to pay them handsome returns for their outlay and labor. Messrs. Hamilton & Harrison have been for some time past prospecting in the neighborhood of Crocker's ranch, and with a good prospect of success, as we learn they have struck a lead of gravel which affords sufficient encouragement to commence work as soon as the necessary preparations can be completed.

Grass Valley Union, Nov. 21st: A crushing from the Union Jack mine, made last week, showed a yield of \$5 per ton, the largest yet obtained from the Union Jack. The rock is cheaply worked, the entire expenses for extracting and reducing being but \$12 per ton, leaving a profit of \$23 per ton. The rock recently crushed was obtained

at a vertical depth of 150 feet from the surface, and 450 south of the Ione shaft. The lode at this depth varies in width from 18 inches to 8 feet. The Ione mill is now running night and day on Union Jack rock.

## Placer County.

*Auburn Stars and Stripes*, Nov. 21st: The quartz mill near Ophir, which was erected by the late Col. Hagen and destroyed by fire some months ago, has been rebuilt under the superintendence of Mr. R. W. Billet, and was set in motion last week. Mr. Billet has a large amount of promising rock out, ready for crushing. Specimens taken from the shaft have been shown us, which consist almost wholly of sulphurets. Working tests of these sulphurets yielded an average of \$480 per ton. Of the specimens which we have inspected, fully 80 per cent. consists of sulphurets. They much resemble the best of the specimens from Meadow Lake ledges that created such a furore about two years ago.

Herriek Robards, an old Californian, and generally an unfortunate one, who has prospected for years without any decided success, struck a fissure last Friday that yielded in 36 hours' digging and washing a little over 813 ozs. of gold. Being coarse, washed river gold, from a neighborhood that has always been famous for good dust, this lot is estimated to be worth \$19.50 per oz., which would give Robards \$15,853.50 for three days' labor.

*Dutch Flat Enquirer*, Nov. 23d: Mining is all the go here. The late encouraging prospects of the Rising Sun Co. have put our quartz men at work. This enterprising company have erected hoisting and pumping machinery.

*Auburn Herald*, Nov. 23d: The rock in the Wall ledge continues to prove rich. On Sunday last, we saw a piece of rock taken out at the depth of 50 ft., which was studded with free gold. The company have out about 20 tons of rock, which they believe will pay \$100 to the ton.

## Plumas County.

*Quincy National*, Nov. 16: Messrs. Westcott & Co., near Greenville, lately cleaned up \$2,500 for a week's run. Their vein is six feet in width.

The New Caledonia mill, built by H. C. Bidwell & Co., in Cherokee Dist., is now under way. The mine is highly valuable. The yield for the past week, we are informed, was \$4,000. The machinery of this mill was built by Prescott & Scheidell, of Marysville, and gives full satisfaction. Judkins & Kellogg have a seven-foot vein of fine pay on the lode as the Caledonia.

Messrs. Keating & Co. are erecting a new quartz mill in Light's Cañon, for the purpose of crushing rock from the Enterprise ledge. This ledge prospects well, and is expected to yield largely in silver.

We learn that Van Buskirk & Co. have obtained a prospect from the Buchanan ledge, in the north arm of Indian Valley, of about \$7 to the ton upon a working test. The rock was crushed in the Lone Star mill.

The Central ledge, Cherokee Dist., has commenced to prospect finely. A lot of the rock was crushed last week, and yielded 20 ozs. for 40 hours run.

## Sutter County.

*Banner*, Nov. 23: A correspondent writes: The Nimrod Copper ledge presents a cropping of some 60 ft. in width, and, from every appearance, is rich enough in copper to satisfy the most avaricious. The ore is contained in a grey rock and is of the kind known as the Peacock ore, and runs through the rock in seams of one-fourth to one-half an inch in thickness. The whole ledge seems to be half copper.

## Sierra County.

*Downieville Messenger*, Nov. 23d: The first run of the Phoenix mill, located just above Sierra City, will close with this week. The rock from the ledge up on the Buttes is run down on pack mules, and prospects remarkably rich.

The Chips Quartz Co. are getting out the material for a new mill. The old one is still tramping out rock and pays.

At Gibsonville, mining matters seem to be progressing. The correspondent from that place gives a descriptive account of several of the mines, but nothing new appears.—[Eds. Press.

The Comet Co., of Gardiner's Point, took out last week, with four picks only, \$1,490; and that was taken out along the main tunnel, whilst repairing the same.

## Tuolumne County.

*Nevada Gazette*, Nov. 25th: D. O. McCarthy, formerly proprietor of the Flag, has perfected arrangements for the purpose of working Kincaid's Flat, near Sonora, Tuolumne County. A company has been organized in San Francisco, the ground purchased, and a tunnel will be run through the ridge that will tap the vein to the depth of 126 ft.; the tunnel will be about 200 ft. in length.

## Yuba County.

*Marysville Appeal*, Nov. 24th: The late rains give an abundance of water for the miners, as well as rendering the earth soft and yielding to the hydraulic pipe.

The *Alla* of this city, speaking of the Smartsville mines, says: From Smartsville we hear that the valuable hydraulic mines of that locality are well supplied, and work has been recommenced on some claims in which there will be no cessation until next July or August. On the famous Blue Point and Union gravel claims work is being pushed with vigor, these claims being supplied from the Nevada Reservoir Ditch Co.

## ARIZONA.

*Miner*, Nov. 9th: Mr. Cook's furnace, built of lava rock, for the purpose of testing ores, has not been a complete success. The rock, it seems, will not resist very great heat. Mr. Cook, however, informs us that he has received a specimen of rock, said to have come from an extensive deposit in the vicinity of Walnut Grove, which stood a severe test, and as soon as he is satisfied that enough of the material can be obtained for his purpose, he will dispatch a team for a load of it.

Mr. Gray will go to San Francisco in about a week, and on his return hither will be accompanied by the eminent metallurgist, F. Kustel, who will introduce here the chlorination process, now so successfully employed in the reduction of sulphurets at Grass Valley, California. Mr. Kustel tested by this process a quantity of rock from the Galena lode, Big Bug Dist., and was satisfied that it would pay well to work such rock on a large scale.

Major Coffin writes from the East that money matters are all right, but that the company have not yet decided what to do.

## BRITISH COLUMBIA.

*Cariho Sentinel*, Oct. 10th: Notwithstanding the great scarcity of water, the news from Mosquito Gulch is encouraging. The result of work during the past week was as follows: Hoeking Co. (one day) 65 ozs.; Minnehaha Co. 50 ozs.; Holman Co. 50 ozs.; Point Co. 25 ozs.; Discovery Co. 12 ozs.; and Willow Co. 40 ozs.

Oct. 14th: On William's Creek the Wilson Co. have erected a hydraulic apparatus, and are now taking off the top dirt in large quantities. All the companies on this creek are doing well, taking out from 10 to 100 ozs. each per week.

All the companies on Stout's Gulch have resumed operations. The different companies taking out from 40 to 70 ozs. each during the past week.

On Conklin's Gulch, prospects are fair, all the companies at work are making wages.

The Minnehaha Co. in Mosquito Gulch, washed up for the week ending Oct. 13th, 112 ozs. Considerable prospecting is going on in Red Gulch, with more or less success.

The water in Lowhee Creek has not risen sufficiently to enable the hydraulic claims to commence work.

It is reported that the Rolly Co. on Grouse Creek has struck a prospect of \$5 to the pan. Other companies on the creek are doing well.

Miners on Lightning Creek are making wages.

Stevens Creek, which gave such flattering promise last spring of becoming a profitable mining camp, has not, so far, come up to general expectation.

Oct. 17th: The result of the last week's work in Mosquito Gulch were as follows: Willow Co. 25 ozs.; Point Co. 15 ozs.; Holman Co. 40 ozs.; and Jeffrey Co. 57 ozs.

Companies on Keithley's Creek are making \$15 per day to the hand.

The report that good prospects have been struck in the Rolly claim at Grouse Creek, has been confirmed. As much as \$5 has been obtained from two buckets of dirt. The Point Co. are making from 50 cts. to \$1 to the pan.

The companies on Antler Creek are getting good prospects.

On Cedar Creek the different companies are making from \$15 to \$20 per day to the hand. A party who lately prospected from Cedar Creek, towards the headwaters of the Thompson Creek, reports good prospects in several places.

## COLORADO.

*Georgetown Miner*, Nov. 7th: A. D. Foster has made six assays of ore from the full width of the pay vein, in the Junction lode on Democrat Mountain, taken from the crevice with his own hands, which gave the following results: 1st class sulphuret ore, \$1,749.92 silver per ton; 2d class, \$1,779.64 per ton; 3d class, with galena, \$479.56 per ton; 4th class, \$440.97 per ton; 5th class, \$215.76 per ton; 6th class, with clay or gouge, \$93.27 per ton. The above assays indicate an average of \$1,293.19 silver per ton of ore.

Byron E. Cox has made a new discovery

on Democrat Mountain, that shows four ft. of sulphuret ore. It is called the William Penn, and is the extension of the Midas. The discovery is owned by Cox, Sites & Rigby. They are now engaged in actively developing the property.

The Morning Star lode is opened by a shaft 33 ft. in depth, and has a 5-ft. crevice, carrying an ore seam of argentiferous galena two ft. in width. The ore assays as high as \$1,078 per ton.

Five tons of ore, from the W. B. Astor lode, run during the past week by Garrott, Martine & Co., the result was as follows: Average assay, \$265.50. Yield of the five tons, 1,017 ozs., coin value, \$1,146.48. Yield per ton \$229.33%. Per cent saved \$6.5. Currency value, \$1,400.

Denver News, Nov. 13th: Mr. Geo. L. Sites showed us last evening, a fine silver brick weighing 254 45-100 ozs. It was from four tons of ore from the Nyanza and Crescent lodes, and was from the reduction works of Garrott, Martine & Co. Its value was \$261.55.

At the First National Bank this morning, was a fine bar of gold bullion, weighing 192 33-100 ozs.; fineness, .814%; value in coin, \$3,283.20. At the mint were two bars belonging to Warren Hassey & Co., weighing and valued as follows: 38 46-100 ozs., 30 32-100 ozs.; \$639.92, \$546.12, in coin.

The Register says: Wm. Main, Jr., has been making experiments in amalgamating at the Monnier works, which have resulted so well that he is momentarily expecting orders from the company to start their works.

Mr. Badger has leased the Quartz Hill Co's mill, and Mr. Remick the La Crosse Co's, both to be run on custom ores.

Some persons have discovered a rich lode near the American Flag, on a line with the Burroughs, believed to be the extension of that lode. The Clark Gardiner Co. are mining and getting their ore crushed at Young's mill in Spring Gulch. Mr. George T. Clark is sending 150 lbs. of ore from Young America lode to the East. Joseph Keyon yesterday showed us a gold brick, very fine, weighing 101 1/2 dwts., which he says came from two tons of ore.

#### IDAHO.

Owyhee *Avalanche*, Nov. 16th: Great improvements have recently been made at the Oro Fino mine. A large ore house has been built, and the car-track leading thereto from the tunnel is substantially covered, to render it proof against the storms of winter.

Large quantities of ore has been taken out of the Ida Elmore.

Work on the North Star or Golden Charlot mine is rapidly progressing, and buildings for the reception of ore, etc., are being erected. The ore is of the same character as that of the Ida Elmore—being, in fact, a continuation of the same ledge. We noticed a large pile of ore on the dump, several pieces of which we examined contained gold visible to the naked eye. It also contains a large amount of silver in the form of black sulphurets.

Several tons of Woodstock ore are now at the Sinker mill, and will be crushed in a few days.

World, Nov. 13th: Mining at Willow Creek is mostly in small gulches. The diggings pay fair wages.

#### MONTANA.

Post, Nov. 9th: From the Salmon river mines we learn the following: There are now some 400 men at the mines. A majority will remain during the winter. The Douglas Co., on Napias, have taken from their claim of 400x50 feet, over \$40,000. They had \$2 and \$3 to the pan, and eight feet of bed rock, when work was suspended. Below the falls on Napias, \$50 per hand has been taken out. B. L. Heath & Co. have about 1,000 feet above the falls, and are now putting in a bed-rock flume. In Wright's Gulch, where water failed early in the season, good wages have since been made with rockers. Taking the camp on an average, it is believed it will afford good wages to 800 or 1,000 men, and sufficient water to give them steady employment. The quantity of second or third rate ground is unlimited. The Chinese are coming in thickly. A 10-stamp mill has been started for Flint Creek District.

Gulch mining has been sadly interfered with in the past week by the severe night frosts, and but little has been accomplished. Ground shoving on the bars along Alder Gulch is almost entirely suspended.

We saw to-day in the banking house of Messrs. Pippy & Co. two bars of bullion, which aggregated 45 lbs., the result of two days purchase.

The Philadelphia Co's mill cleaned up on Sunday about \$3,500 from the last week's run on the Union lead.

#### NEVADA.

Black Rock.  
Susauville *Sage Brush*, Nov. 9th: Parties

in from Black Rock state that the work is going ahead upon the two mills situated at Rani's Horn. The mill of Messrs. Oplyke, Atchinson & Co. is being built at Black Rock, north of the mill of A. Evans & Co. They will have their mill in running order in a few weeks. The ore that had been crushed at the old mill was cleaned-up by Isenbeck and produced a large mass of amalgam proportioned to the ore worked. Ten tons of the Snow Storm ore has been recently crushed in the same mill, and will be amalgamated in a few days. Every man upon the ground is reported to be at work and sanguine of success at the present working.

From the same paper of a later date, Nov. 16th, we find the above statement materially affected by the following: From parties that have arrived from Black Rock we ascertain that the experimenting of Professor Isenbeck in the mill of Evans, Harvey & Co., has been a signal failure. Some 15 tons of Snow Storm ore were crushed and manipulated at this mill and not a trace of gold or silver was obtained.

Notwithstanding this failure, the *Sage Brush* declares its faith in the richness in Black Rock.

The Humboldt Register, of Nov. 16th, says that after his failure at Evans' mill, Isenbeck, feeling a little unwell, started for California, where he considers the atmosphere more healthy for him just at this time, but promised his numerous and beloved friends that he would return again in the "Spring-time, Gentle Annie," when all would be made satisfactory!

The same paper adds: The Isenbeck "flats," we learn, are about worked out. In fact it has been a mystery to many, how they could be made to yield "pay dirt" so long, as they were very shallow and the gold coarse.

[A description of the ores of the Black Rock mines, together with further information concerning Isenbeck's failure, will be found in our editorial columns.—EDITORS PRESS.]

#### ESMERALDA.

Virginia *Enterprise*, Nov. 23d: A lot of 16 1/2 tons of ore from the Wilson mine, H. C. Toombs, superintendent, lately worked in Crossman's astras, yielded \$2,076.29. The Wheeler mine looks well in sulphuret ore. The Pioneer mill will do no custom work, but will be run altogether on ore from the Wheeler mine. The erection of the Williams mill is being rushed forward with all possible speed.

#### PAHRANAGAT.

San Bernardino *Guardian*, Nov. 16th: From Pahranaगत we learn that the New York Co. are in full and successful operation; that in addition to the mill already at work, a Philadelphia Co. is putting up another, and the camp generally is in a prosperous condition, all hands being employed and doing well.

#### REESE RIVER.

Reveille, Nov. 16th: The shipment of bullion from the Florida mine from Nov. 17th, 1866, to Nov. 12th, 1867, was \$106,563.35.

Nov. 18th: The Magnolia mine, in the Morey Dist., is now producing a superior quality of ore. A lot of 12 tons, worked at the Old Dominion mill at Hot Creek, yielded a pulp assay of \$259 per ton. A force of eight men is employed in the mine, and two teams are constantly engaged in hauling ore from the mine to the mill. The ore met with below the water line is an antimonial sulphuret, and is very similar to that produced by the mines of Lander Hill.

Last week, 10 tons of ore from the Buckeye mine in Summit Cañon, North Twin River Dist., were reduced at the Metacomb mill with the following result: seven tons of chloride ore gave a pulp assay of \$241 per ton, and three tons of sulphuret ore at the rate of \$231 per ton. The mine produces unique ore.

In six days of last week, from Monday until Saturday, inclusive, the Long Island mill, with a battery of five stamps and two roasting furnaces, produced bullion of the value of \$7,000. The ore reduced was from the Timoke mine, and was of a very high grade.

Nov. 19th: The negotiations for the transfer of the Santa Elena property in Washington Dist. have been concluded, and all the property—mines, houses, etc.—is now in possession of the agent of a New York Co. It is the intention of the present owners to erect immediately extensive smelting works for the reduction of the ore produced by the Santa Elena and other veins bearing rich galena.

A gentleman lately from Reveille Dist. reports success in obtaining large amounts of silver from the ores there mined. Eight tons of ore from the Sweepstake mine were

lately hauled to the mill at Hot Creek. One ton of this being first class yielded \$900; the balance had not been worked, but was estimated at over \$200 per ton. Seven tons were taken from the Davis lode to the same mill, producing an aggregate of \$987, or \$141 per ton. The first class ore produced \$208 per ton. There are but few miners now in the district, but these are profitably engaged in gathering ore, which is taken either to Hot Creek or Anstin for reduction. The two mills at Hot Creek are kept at work; that of the Consolidation Co. on tailings of its former workings, and the mill of the Old Dominion Co. on the company's and custom ore. Sixty-five tons of ore from Morey Dist. were lately worked at the latter mill which gave an average of \$171 per ton, and it is understood that the ledge from which it was taken was a large one, and all through it the ore is equally good.

The Troy mine, on Lander Hill, is producing ore of extraordinary richness. Ten tons were reduced at the California mill last week, which yielded by assays of the pulp at the rate of \$381.75 per ton. The Troy is opened through an incline to the depth of 375 ft., along which a small compact vein holds a fine quality of ore. It is a parallel vein to the Florida, both in its course, size, appearance, and character of mineral.

Splendid ore has been developed in the El Dorado mine, in Silver Bend Dist. At the depth of 104 ft. in the incline, about 60 ft. perpendicular, a stratum 15 ins. wide was uncovered, selected specimens of which gave, by assay, \$2,803.32 of silver per ton. The ledge has not been cut through in the incline, but it is known to be very wide.

The stage this morning brought \$2,000 ozs. of bullion from the mill of the Social and Steptoe Co. at Egan Cañon. It is 600 fine in silver and 12 1/2 fine in gold.

Last evening, Russell's stage from the Cortez Dist. brought six bars of bullion, of the value of \$5,000, produced by the mill of the Mount Tenabo Co. It was the result of the clean-up, and the mill has been closed.

Yesterday, a bar of bullion, weighing 1,535 ozs., arrived in the city from the Knickerbocker mill, near Ione.

Nov. 20th: Last evening, 3,200 ozs. of crude bullion, from the Old Dominion mill, arrived in the city.

At one o'clock to-day, two teams passed through the city with hoisting machinery for the Combination Co. at Belmont.

Silver Bend Reporter, Nov. 16th: Some of the Transylvania No. 1 ore is exceedingly rich, as will be seen by the following assay made by Messrs. Cahill Bros. on Wednesday: \$26,691.97 per ton. The assay was made for the Belmont Co., from ore taken from the upper level of their mine.

Within the past few weeks several promising ledges have been found and locations made in the hills across the neck at the lower end of Monitor Valley, commencing about a half mile south from the point where the El Dorado and Transylvania ledges disappear, and continuing in that direction. As there are two well-defined and distinct parallel ledges, lying about the same distance apart, as are the two ledges named, and from a similarity of ore, nearly all who have seen them consider the newly discovered veins and the Transylvania and El Dorado identical.

A day or two since we saw a beautiful specimen of horn silver from the upper level of the Belmont Co's Transylvania No. 1. It was nearly as large as a person's hand and about half as thick as a quarter of a dollar—having been scaled from the quartz, in the interstices of which it was formed. In the flame of a candle it would melt as readily as wax, precipitating globules of virgin silver. A great deal of this ore is found in the level whence it came, though seldom separated from the rock in such immense flakes as the specimen shown us.

In the incline of the El Dorado South a stratum of good ore has been disclosed, which is several feet in thickness and is fast increasing its size as greater depth is attained. In richness this ore is said to be fully up to the average quality of any in the district.

The Magnolia mine at Morey is producing a superb ore. A lot of 10 or 15 tons, just worked at the mill of the Old Dominion Co., Hot Creek, gave a pulp assay of \$259 per ton. Two teams are constantly employed in hauling ore to the mill from this mine, and eight men are at work upon it. At the water line the ore is an antimonial sulphuret—similar to that of the mines of Lander Hill.

The Old Dominion mill is now supplied with salt from a marsh about 30 miles east of the mill. The saline deposit embraces an area of 10 or 15 miles square.

Reveille, Nov. 21st: The roasting furnaces for the Old Dominion mill were completed last week, and the mill will now produce bullion to the full extent of its capacity.

The Old Dominion mine looks well, and after a while it will be in a condition to produce sufficient ore for the supply of the mill.

Nov. 22d: This morning 8,000 ozs. of bullion arrived from Rigby's mill in San Antonio Dist.

Three bars of bullion arrived last evening from the mill of the Belmont Co.

The mine of the Combination Co., on the Highbridge, presents a superb appearance. A large amount of ore of high quality has been brought to the surface, but the best is stered in chambers below ground until it can be taken to the mill.

We were shown this morning a variety of specimens of ore from the Twin Ophirs mine of the La Plata Co., in Park Cañon. They are chiefly remarkable for the exhibition of metallic silver, which occurs in flakes and occasionally in threads or wires. The ore is of an improved quality to that produced formerly by the mine, and appears to be of a different character. We learned that 500 tons were on the dump, the whole of which would yield a handsome profit over the cost of reduction. The mine is an extensive deposit of peculiar and valuable ore.

Eight tons of ore from the Sweepstake ledge in Reveille Dist. have been hauled to Hot Creek for reduction in the Old Dominion mill, with the following result: one ton of first class yielded \$900, and seven tons of second class \$2,800—at the rate of \$400 per ton.

#### WASHOE.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

Virginia *Enterprise*, Nov. 19th: We were yesterday shown a specimen of ore said to have been found a mile west of the Comstock. It appeared to be rich in silver sulphurets. An assay is being made.

Nov. 21st: At the present time a very considerable amount of prospecting is being done in the vicinity of this city in the surface works of the numerous abandoned claims. A lot of four tons of ore from one such mine is now being worked at a mill in Silver City.

A party now in this city has some specimens of ore nearly covered with native silver, said to have been obtained from a newly-discovered mine about "ninety miles away." A few old miners have obtained the secret in regard to the situation, and will leave for the mine in a few days.

Nov. 23d: The claim of the Gold Hill Quartz Mill and Mining Co., Gold Hill proper, is looking exceedingly well in the 290-foot level.

The weekly shipment of bullion from Gold Hill and Virginia, by Wells, Fargo & Co., was 9,044 ozs., valued at \$266,862.42.

Trespas, Nov. 19th: We learn that 100 tons of ore from the mines of Como have been hauled to Birdsall & Carpenter's mill for reduction.

#### OREGON.

Jacksonville *Sentinel*, Nov. 16th: Times in the Sterlingville mining camp are as prosperous as ever. Spaulding and Johnson are driving their tunnel into the boulder channel, and expect to strike pay in a few weeks. There is work for 100 men in this channel, at good wages, if the waters of Applegate Creek are ever brought to work it.

Dalles *Mountaineer*, Nov. 16th: The mining season in the John Day mines is pretty nearly closed, except on Cañon and Dixie creeks.

Five miners have undertaken the construction of a large ditch from the main John Day River to the flat at the mouth of the creek. They have an extensive lot of mining claims, which will pay from \$6 to \$16 per day.

Among the new mining speculations about Cañon City, is the erection of a hydraulic of great power by Thompson & Armington, on the Marysville Hill. The hydraulic claims of Clark & Rice, at the foot of Rich Gulch, have been lying idle most of the past season, but promise to turn out well when water can be had.

#### UTAH.

Frank McGowan and John Holbrook, who have just arrived from the Sweetwater mines, report that up to the time they left the weather had been favorable, and the miners had improved it by getting well housed for the winter. A number of new and very rich claims, both quartz and placer, had been discovered, and the miners generally were in high feather over their really brilliant prospects.

HOW TO MAKE A HORSE SHINE.—Take a piece of sheep-skin, with the wool on, oil slightly, rub him smooth, wipe off the hair pretty hard, and this will make a dark-colored horse shine beautifully.

## Canvassing Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. Jan. 11, 1866.

Mr. C. T. Raney is our duly authorized agent for Sacramento County. Nov. 29, 1867.

Dr. J. G. Yates is our duly authorized traveling agent. July 6, 1867.

Mr. A. B. Butler is a duly authorized traveling agent for this paper. July 15, 1867.

Mr. H. C. Northrop, is our duly authorized agent for Oregon, Washington, Idaho, and Montana. Aug. 17.

## San Francisco:

Saturday Morning, Nov. 30, 1867.

## Notices to Correspondents.

**TUBAL CAIN.**—By the reduction of ores is meant the treatment of metallic minerals in such a manner that the metals sought for shall be eventually obtained in the state, free from earthy or other impurities. The term is an alchemical one, but owing to its propriety, has always been employed by modern chemists and metallurgists, especially when treating of ores containing the precious metals. The term, in its simplest aspect, means the reduction of minerals from complex into less complex conditions. Thus, a regulus (excepting that of antimony, which forms an exception,) is a term ordinarily applied to the reduction of the metal sought into an impure sulphuret or oxide, which again may be further reduced to still more simple forms, and ultimately to the primitive or metallic state. You err in supposing that common usage has reversed the meaning of the term reduction, as applied to ores, because, as you assert, the word is vulgarly understood to apply in a manner quite the reverse of that above described. For example: iron or steel is frequently said, in the ordinary language of life, to be reduced to rust, or copper being reduced to a carbonate. Conversion or converted would be the correct terms to apply in such cases. It would be quite proper to say that a piece of coal or wood, after being burned, is reduced to a cinder, as the latter in such a case would not only be reduced in weight, but at the same time be reduced to a less complex chemical form. When iron becomes oxidized or rust, or copper becomes a carbonate, in each case the resulting rust or carbonate will weigh more than the original metal.

**MEDUSA.**—*Chignon* is the French word for the nape of the neck, from which word the term for the ringlingly bundle of hair is derived, which ladies at the present time are in the habit of disfiguring the posterior part of their craniums. The *London Hair-Dressers' Journal*, in a recent number, quoted the following from a treatise on hair-dressing published eighty-five years ago (1782): "Those ladies who are obliged to wear false hair, I would inform them that the greatest difficulty attending it is the putting it on properly. Now to put it on; and first, the false *chignon*. I have before said where this is to be placed, but if it is not made very flat and strong, with a good, small comb, it will make the head appear bumpy and awkward behind." *Chignons* do not therefore possess the merit of being a fashionable novelty. Our grandmothers speedily discarded it. How soon will their grand-daughters display the same good sense?

S. W., San Bernardino.—Capillary pyrites is a sulphuret of nickel. It is rather a rare mineral. It consists of the proto-sulphide of nickel; the proportion being about 65 per cent. of nickel and 35 per cent. of sulphur. It is harder than calc spar, brass yellow color, inclining to bronze. It is found as capillary, regular six-sided prisms. The most singular localities in which it is found are at the Dowlais Iron Works, near Merthyr Tydvil, South Wales, where it is found in regular crystals, occupying cavities in nodules of spathetic iron; and at the Sterling mine, Antwerp, N. Y., where it is in a somewhat similar manner found amongst crystals of spathetic iron as delicate capillary crystals.

## The Black Rock Mines.

There is probably no locality on the Pacific Coast from which such contradictory reports and opinions have been received, as from the Black Rock mines. While nearly all assayers and experts of established reputation have pronounced the so-called "ores" from that district to be utterly worthless, and no ores at all—there has been, ever since the discovery of the mines, a class of men with but little or no experience, either as miners or metallurgists, who have been persistent in their declarations that those "ores" were very generally of extraordinary richness. These men have even exhibited to the hopeful shareholders "hairs" and "buttons" of the precious metals, which they claim to have taken from the ores by assays and working processes—which they generally assert to be new and secret, and hence the fact that others do not succeed in their manipulations.

We have sought in vain, for two years past, to get access to some of these ores, but, with the exception of three or four very small specimens, have never been able to meet with any until a few days since, when Mr. John Cuddy, a gentleman who has been induced to invest a considerable amount of money and some labor and time in these mines, on the faith of those "secret process" men, brought to this office a flour sack full of specimens, which he had collected himself from more than twenty claims in that district. A brief examination of the contents of this sack satisfied us, at once, that so far as those samples went to illustrate the value of the Black Rock mines, they were the veriest humbugs that were ever palmed off upon a credulous public. Only two samples out of the entire number presented, were such as could for a moment be considered as coming from a vein carrying either silver or gold, and each of these (the Snow Storm and Green Series) were of an extremely doubtful character. All the others were unmistakably volcanic debris, such as were never known to yield either of the precious metals; and we venture the assertion, that not even the color of either gold or silver was ever found in any such rock, notwithstanding the oft-repeated assertions to the contrary by pretended experts and assayers.

It is one of the most extraordinary facts connected with mining on this coast, that mine adventurers, who themselves make no claims to a knowledge of such things, nevertheless persist in giving heed to the pretensions of men of but limited, if any experience in mining or metallurgy, to the almost utter rejection of those who are known to have had large experience in some of the most advanced and successful mining districts in other parts of the world. This unaccountable disposition on the part of mine owners has cost the country untold millions of dollars, and is being constantly repeated to the present day.

## STILL LATER FROM BLACK ROCK.

Since the above was written, our attention has been called to the following paragraph from the *Gold Hill Trespass*, fully confirmatory of what we have written above:

Yesterday we published intelligence from the Black Rock mines, upon the authority of Charles Isenbeck, who has just returned from that country, where he has been superintending the working of various ores from the mines thereabouts, at Evans & Co's mill. This morning we received a call from Mr. L. Bass, who is a partner of Evans in the Black Rock mill, who makes a statement directly in contravention of what Isenbeck informed us, and making a direct issue of veracity between the two gentlemen. We do not propose to take any stock in the fight, but feel willing that both parties shall have full benefit of all doubts arising as to the wealth of the Black Rock country.

Mr. Bass says: "I am part proprietor of the Black Rock mill; I engaged Charles Isenbeck to go there and superintend the working of the Black Rock ore, at a salary of \$1,000 per month, provided he could produce paying returns from the ore; I paid him \$500 in advance, and he went to the mill; I furnished him everything he demanded that

would insure success in reducing the ore; he worked between ten and twelve tons. Instead of the quicksilver gaining 122 pounds of amalgam, as stated by Mr. Isenbeck yesterday, it lost the usual amount in working; and all the amalgam found was about a half pound, which, upon examination and assay, proved to be nothing but copper, with no trace of gold or silver therein. After this test by Isenbeck, I called upon him to return the \$500 advanced upon contract, which he promptly refunded to me, he not having been able to procure any precious metals from the ore by his process. Mr. Isenbeck is the third person who has asserted that he could get rich returns from the ore; each has failed, and I never yet have seen a quarter of a dollar in silver or gold actually produced from working the Black Rock ores, and never any signs of either, except in fire assays, one of a dozen of which have perhaps shown gold and silver in paying quantities."

Mr. B. concludes his statement with still asserting his belief in the richness of the Black Rock mines, notwithstanding the above failure. We most certainly hope that his faith may be fully realized, for we do not wish to see loss or failure in mining enterprises anywhere; but if he relies upon such ore as has been submitted for inspection by Mr. Cuddy, as a fair sample of the best mines in that district, he had better abandon his enterprise at once as utterly hopeless.

## Pacific Chemical Works.

We have recently paid a visit to this establishment. We can truly say that in our frequent "raids" in search of signs of progress in our city, nothing has given us greater pleasure than this visit. Messrs. Falkenau & Hanks, the proprietors, recognizing in us a "kindred spirit,"—a lover of science for itself,—"showed us round" with the greatest courtesy, explaining their various processes and plans with that freedom from petty narrowness which characterizes true scientists.

These gentlemen are bound to make their mark. Their business union is a fortunate one. Both well grounded in the principles of their profession—one in European scientific schools, the other in those of the United States—they constitute a firm in which German exactness and pains-taking thoroughness are most happily blended with American originality and energy. Both have had large experience, and both have been teachers in their scientific specialty. They are no ordinary manipulators; they are thinkers. Engaged in the pursuit of the most fascinating of sciences, they discuss with enthusiasm the more abstruse metaphysical questions which such researches are sure to suggest to men of a philosophic turn;—without, however, losing sight of the fact that nothing is truly science except those truths which are demonstrated, and which can be stated in terms as rigidly exact as those of an algebraic formula. Such men as these are the real progressionists; men who, while their positive conclusions are always held in suspension until warranted by absolute proof, enter with a genuine heartiness into scientific investigations. Without such enthusiasm the most thorough scientific training is comparatively unproductive; for, although the beaten track may be unerringly followed, no new paths in the exploration of this immense field will be struck out.

But to our description of the establishment. In the arrangement of the different departments the most perfect system is apparent. Taking them in their order, we first visited the

## ACID ROOM.

Here are manufactured pure nitric, muriatic, and sulphuric acids. A furnace of peculiar construction, designed by Messrs. F. & H., and arranged in such a manner as to afford the greatest convenience, and at the same time to economize space, stands in the center. It has room for eight retorts, each capable of preparing from thirty to forty pounds of acid in twenty-four hours. These acids are put up in bottles containing about seven and a half pounds each. Both imported bottles and those of California

manufacture are used;—in the latter case it is necessary to "grind in" the stoppers. This is done at the establishment; and though apparently a simple matter, it is really a process involving not only a good deal of ingenuity as regards the apparatus devised for the purpose by Messrs. F. & H., but also considerable practice for the dexterous handling of that apparatus. The next is the

## CRYSTALLIZING ROOM.

This room contains two large boilers,—one of copper, the other of iron,—besides several smaller ones of the latter material. There are also tanks of different sizes, in which the crystallization of various chemicals is going on. Some of these tanks are lined with lead. Vats for clarifying and settling liquids, and other apparatus necessary in this connection occupy the remaining space.

## FURNACE ROOM.

Here are two calcining furnaces, one melting furnace for bullion or for crucible assays, one muffle furnace for scorification and cupellation, and a furnace with a top of boiler-iron, upon which to place a large sand-bath. Shelves filled with crucibles, scorifiers, cupsels, and molds, are at hand. Tongs and pokers of multifarious shapes, hang conveniently within reach of the furnace doors;—and an anvil stands ready for use, in the freeing of an assay button from its slag for cupellation, or flattening the cupelled globule for parting. In this room we saw an iron apparatus for the distillation of ammonia; as also two stone-ware condensers, used in the manufacture of that article. We may add, that these condensers were made at the pottery of J. W. Orr, in the immediate neighborhood of the works. A sink with a supply of water, and an inclined and grooved table for draining, complete the furniture of this apartment.

## NITRATE OF SILVER ROOM.

This is a small room devoted solely to the manufacture of the above named important article. The necessity for the careful avoidance of fumes and gases generated by any other processes which might be going on, will at once be apparent;—since, for the use of photographers, etc., the article must be absolutely pure. On one side of the room are air-tight closets with glazed doors, within which large evaporating dishes containing the nitrate of silver in solution are placed,—upon a frame-work,—each with its heating lamp beneath. Upon the weighing table close at hand, everything is in its place; consequently no leaving the room or the table is necessary. The apparatus used is for this room only. No assistant is intrusted with this manufacture. Although several men are employed in other parts of the establishment, the work in this room is performed entirely by the proprietors themselves. They find their reward in the high reputation which the article sent out from their establishment has already achieved. It is acknowledged as unrivaled.

## STORE ROOM AND PACKING ROOM.

Here are kept on hand, and put up for the market, the results of the work. Besides the acids and the nitrate of silver which we have mentioned, we saw here large quantities of cyanide of potassium, sodium in large and small packages, sodium-amalgam in one and two pound bottles, fused nitrate of silver, or lunar caustic, for medicinal use,—Nos. 1 and 2,—chloride of zinc, chromic acid, test lead for assayers, fine chemicals for photographers, etc., and a multitude of other preparations which it is not necessary here to particularize. We may mention, that cyanide of potassium is growing more and more into favor with millmen, and the demand is constantly increasing. It seems to act in a manner similar to that in which sodium-amalgam acts,—does not decompose so rapidly, and is much cheaper. In this room is also stored such apparatus as is not at the moment in use. We come now to the

## LABORATORY.

As we enter, we notice first the *Blowpipe table*. We will not mention in detail its appliances, but merely state that they comprise everything necessary for the making of ore assays, and for the determination of minerals; as well as for the many little operations for which this instrument is so often used by the chemical manipulator. Next to this table is another, upon which is placed a *desiccator*, consisting of a large bell-glass, so ground upon its edge as to fit perfectly airtight on the surface of a heavy glass-plate, which is also ground. It is for drying such matters as will not bear heat. The article to be dried is placed within it upon a support, underneath which is a vessel of sulphuric acid, for the purpose of absorbing every particle of the moisture. We come next to a case of shelves with glazed doors, containing a collection of pure chemicals, and rare preparations used for special purposes of investigation. Under this is a

chest of small drawers in which are kept all sorts of tools and implements, glass tubing and other glassware, porcelain crucibles, etc., etc. An exquisitely delicate apparatus for volumetric assays, with divers minutely graduated burettes, pipettes, etc., is arranged upon a stand alongside. The working-tables, one for each of the partners, each the counterpart of the other, and each provided with its own complement of re-agents, and other requisites, stand back to back in the center of the room. Between them is a recess which serves as a receptacle for dirty glasses, mortars, etc., which being done with for the time, are ready to be taken away by an assistant to be washed. Until an article is placed within that receptacle, it is never to be touched, no matter how dirty, or how empty it may appear. Even of the partners, neither ever thinks of meddling with anything upon the table of the other. The necessity for this invariable rule will be seen, when it is remembered that an experiment is sometimes on hand for weeks and that a thin film of what may seem to be nothing but dust, upon the inside of a glass, may be the precious crystallized result of the patient work of all those weeks. Again; the mere withdrawing of the stopper of a re-agent bottle, under certain circumstances,—as for instance, when the room is filled with fumes of such or such a nature,—may so modify the contents of such bottle, as to vitiate the next analysis made with such contents, and lead to wrong conclusions. It is therefore essential that the operator should be able to recall to mind every circumstance which may have contributed to produce an unexpected result; and this is obviously impossible, if any other person has had the handling of his apparatus.

The labor of weeks in a laboratory may be destroyed by a moment of carelessness, as well as by a moment of meddling. As an instance of this, Mr. Falkenau related to us the following incident: When that gentleman was Assistant at the Royal Laboratory in Munich, Bavaria, he had occasion to make a series of elaborate experiments for the analysis of a certain compound, in a case involving a question in reference to a valuable patent. He was occupied in this for nine months, and was on the point of completing his labors, which only farther consisted in the final operation of weighing several separate articles already arranged upon a tray, when a careless student, entering hastily, upset the tray, and ruined his work! There was no alternative; the patient labor of three-fourths of a year had to be commenced anew.

**WEIGHING ROOM, LIBRARY AND STUDY.**  
This room is the last in the list. In it are contained two delicate assay balances with the necessary appurtenances,—the library of the establishment, consisting chiefly of the most important works in German, French and English, upon the subjects with which it has to deal,—and desks with writing materials and all conveniences for making necessary calculations.

The proprietors find here already an extensive field for their work in the analysis of mineral waters, wines, fuels, ores, and commercial articles. Analyses pertaining to medico-judicial investigations, occupy a portion of their time. They are making arrangements to still further extend their operations by the manufacture of certain other articles which have not hitherto been made on this side the continent.

This establishment is unquestionably one of the most important upon the Pacific coast. As pioneers in the business, Messrs. F. & H. deserve great credit; and as thorough and reliable men, fully competent to carry it on as it ought to be carried on, they deserve, and will undoubtedly secure, the patronage and the friendship of all.

THE LEGISLATURE meets at Sacramento on Wednesday next. The inaugural ceremonies will take place on Monday or Tuesday.

**HENDY'S LATEST IMPROVED PATENT SELF-DISCHARGING SULPHURETS CONCENTRATOR.**

**FOR GOLD AND SILVER ORES,**

**With Revolving Stirrers and Rotary Distributor.**

This machine is designed for saving finely divided Quicksilver, Amalgam and Gold from the sands, and for concentrating and saving the Sulphurets. Any person of ordinary experience with Quartz Mills can readily fit them up and run them.

Those in want of Concentrators would do well to visit some of the quartz mills that have Hendy's Patent Concentrators in use, and satisfy themselves before purchasing other Concentrators of pretended merit. **THEY ARE WARRANTED TO WORK SATISFACTORILY.**

**Directions for Operating Hendy's Concentrators:**

- FIRST—In setting up, set the pan, A, level by the inner rim, near its center.
- SECOND—While in operation, keep the Pan, A, about half full of sulphurets.
- THIRD—Open the gate, B, sufficiently to discharge the sulphurets as they accumulate over the amount above mentioned.
- FOURTH—The crank shaft to make 200 to 220 revolutions per minute.

**References:**

Reference is made to the following mills, which have HENDY'S CONCENTRATORS in use:

EMPIRE MILL. (7 Concentrators).....	Grass Valley, Nevada County.
NORTH STAR M. & M. CO. (4 Concentrators).....	Grass Valley, Nevada County.
NORRIDGEWOCK MILL. (2 Concentrators).....	Grass Valley, Nevada County.
VALENTINE & CO. Commercial Mill (3 Concentrators).....	Nevada County.
HUMBOLDT CANAL CO. (1 Concentrator).....	Humboldt County, Nevada.
ROBINSON & McALLISTER M & M. CO. (3 Concentrators) Hunter's Valley, Mariposa County.	
PLYMOUTH ROCK MILL CO. (2 Concentrators).....	Calaveras County.
MIDAS MILL CO. (4 Concentrators).....	Virginia, Montana.
GOULD & CURRY G. & S. M. CO. (4 Concentrators).....	Virginia City, Nevada.
VULTURE CO. (4 Concentrators).....	Prescott, Arizona.
NOYES & CO'S MILL. (2 Concentrators).....	Prescott, Arizona.
LUCY MINING CO. (3 Concentrators).....	Owyhee District, Idaho.
MOREY & SPERRY (1 Concentrator).....	New York.
GUADALUPE & SACRAMENTO G. & S. M. CO.....	Simola, Mexico.
EL TASTE CO. (2 Concentrators).....	Sonora, Mexico.
B. F. BROWN (1 Concentrator).....	Melbourne, Australia.

And in use in many other parts of this coast.

The following give additional proof of the increasing popularity of the machine:

SAN FRANCISCO, October 10th, 1867.

J. HENDY, Esq.—Dear Sir:—To your request for an expression, in writing, of my opinion in regard to the merits of your Concentrator, I reply, that I consider it the best machine for saving quicksilver and amalgam, and for concentrating sulphurets, that I have ever used, or seen used. I may add, that I could give you no stronger proof of this than to order, as I did, six more of them, after a trial of one for several months. I shall take pleasure in showing the machine in operation to any one interested, who will call at the mill of the Empire Company, in Grass Valley. Yours,

S. W. LEE, Supt.

SUPERINTENDENT'S OFFICE, GOULD & CURRY S. M. CO., }  
VIRGINIA CITY, Nev., Sept. 17, 1867. }

JOSHUA HENDY, Esq., San Francisco:—Dear Sir:—According to the terms under which I secured from you four (4) of your Concentrators, namely—that they were to be paid for only after a thorough trial had demonstrated their value—I desire to inform you that I have tried them, and have found them to work very satisfactorily, and that they will now be accepted by the Company. You will please present the bill for said Concentrators, say \$1,200, at the office of the Gould & Curry Company in San Francisco. Yours, very truly,  
LOUIS JANIN, JR.

The bill was presented in accordance with the above request, and duly paid.

**CAUTION.**

All of HENDY'S PATENT CONCENTRATORS are marked thus:

"J. HENDY, Patented February 27th and April 17th, 1866."

**AGENTS WANTED.**

ENERGETIC MEN OR WOMEN CAN MAKE MONEY by canvassing for our NEW BOOKS and ENGRAVINGS. One Agent reports thirty-three orders for one book in three days. Address: PACIFIC PUBLISHING COMPANY, 4v15-7p 305 Montgomery street, San Francisco, Cal.

Established in 1849--Corner First and Mission streets, San Francisco.

HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic, Hay, Rascarew and Drop Presses, Coining Machinery, File Drivers, Bark and Malt Mills, and all kinds of Castings.

**ENGINES.**—Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott & Eckart's Adjustable Cut-off Regulator—best in use; W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.

**BOILERS.** Locomotive, Flat, Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.

**PUMPS.**—The Excelsior double-acting Force Pumps are manufactured by us. These very superior Pumps are warranted the best, and are fast replacing all other Force Pumps.

**AMALGAMATING MACHINERY.**—Wheeler & Randall's improved Tractory Curve Pan, Zenas Wheeler's improved flat bottom pan, Beldin's pan, Veitch's tubs, Prater's concentrators, Waklee's pans, Beers' pan, German Barrels, Arastra Gearing, Chilo Mills. Sifters of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams, Pans and Tubs. BLAKE'S PATENT QUARTZ CRUSHERS, of all sizes.

**STEAM BOILING TOOLS AND MACHINERY.**—of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania. We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.

Russia Iron steels, of all degrees of fineness and of all qualities of iron. All work done in the best manner at the lowest cash prices.

H. J. BOOTH, GEO. W. PRESCOTT, IRVING M. SCOTT  
24-12 H. J. BOOTH & CO.

**CANAL ACROSS FLORIDA.**—The old idea of cutting a canal across the northern portion of the peninsula of Florida seems to have been renewed again, with a fair prospect of being carried out this time. Some enterprising New York capitalists are moving in the matter.

**CAPTAIN ROBERT J. LINCOLN.**—instead of having been called to the bar a few weeks ago, as several papers stated, has been a practising lawyer for more than a year. He has just been admitted, however, to the bar of the United States Supreme Court.

**MR. SIMORIN,** Professor of the French School for Mining, under instructions from Napoleon to examine the resources of Colorado, and Mr. Haine, who is looking for a settlement for German emigrants, arrived at Denver, October 5th. Many hundred German miners propose to emigrate to Colorado.

**DEODORIZATION OF KEROSENE AND COAL OILS.**—According to Wagner the peculiar odor of these oils is removed by treating them with a solution of oxide of lead in caustic soda.

**Rates of Postage on Printed Matter to Europe and Asia.**

The Post Office Department has made arrangements by which a number of European and Asiatic countries, hitherto beyond the reach of our mail communication except by letter, are brought within the range of delivery of all, or nearly all, United States mail matter. It is a singular fact, unknown probably to most persons who have not occasion to learn it by unpleasant experience, that there was a considerable region in the civilized world where an American traveler might not receive a newspaper directly from home.

Under the arrangement now completed, prepayment of postage (sometimes at high rates), is made necessary in all cases. The following official statement gives a full list of the countries—with some of which there has been regular communication—that are now included in the delivery by way of Hamburg and Bremen:

Rates of postage on newspapers and other printed matter (periodicals, etc.) sent from the United States to countries in Europe and Asia, by Bremen or Hamburg mail—prepayment compulsory:

**NEWSPAPERS—MARKED AS FOLLOWS:**

- Bremen, by Bremen mail—2 cents each.
- Hamburg, by Hamburg mail—2 cents each.
- Prussia, Austria and German States, by Bremen and Hamburg mail—3 cents each.
- London, by Bremen mail—3 cents each.
- London, by Hamburg mail—3 cents each and 1 cent per 1/4 ounce.
- Schleswig-Holstein and Denmark, by Bremen or Hamburg mail—3 cents each and 1 cent per 1/4 ounce.
- Sweden, by Bremen or Hamburg—3 cents each, and 1 1/2 cent per 1/4 ounce.
- Norway, by Bremen or Hamburg—3 cents each, and 3/4 cent per 1/4 ounce.
- Holland, by Bremen or Hamburg—3 cents each, and 1 cent per 1/4 ounce.
- Russia, by Bremen or Hamburg—3 cents each, and 1 cent per 1/4 ounce.
- Switzerland, by Bremen or Hamburg—4 cents each.
- Italy, by Bremen or Hamburg—5 cents each.
- Turkey, by Bremen or Hamburg—3 cents each, and 5/8 cent per 1/4 ounce.
- Greece, by Bremen or Hamburg—3 cents each, and 5/8 cent per 1/4 ounce.
- Gibraltar, Spain and Portugal, by Bremen or Hamburg—3 cents each, and 2/4 cent per 1/4 ounce.
- Austria, India and China, by Bremen or Hamburg mail via Marseilles—3 cents each, and 3 cents per 1/4 ounce.
- Austria, India and China, by Bremen and Hamburg mails, via Trieste—3 cents each, and 2 cents per 1/4 ounce.

**PERIODICALS, ETC.**

- Bremen, by Bremen mail—1 cent per ounce.
  - Hamburg, by Hamburg mail—1 cent per ounce.
  - Prussia, Austria and German States, by Bremen or Hamburg mail—1/2 cent per ounce.
  - London, by Bremen mail—1 1/4 cent per ounce.
  - London, by Hamburg mail—1 1/4 cent per ounce, and 1/2 cent per 1/4 ounce.
  - Schleswig-Holstein and Denmark, by Bremen or Hamburg—1 1/2 cent per ounce and 1/2 cent per 1/4 ounce.
  - Sweden, by Bremen or Hamburg—1 1/2 cent per ounce, and 2 cents per 1/4 ounce.
  - Norway, by Bremen or Hamburg—1 1/2 cent per ounce, and 4 cents per 1/4 ounce.
  - Holland, by Bremen or Hamburg—1 1/2 cent per ounce, and 1 1/2 cent per 1/4 ounce.
  - Russia, by Bremen or Hamburg—1 1/2 cent per ounce, and 1 1/2 cent per 1/4 ounce.
  - Switzerland, by Bremen or Hamburg—1 1/2 cent per ounce, and 1 cent per 1/4 ounce.
  - Italy, by Bremen or Hamburg—1 1/2 cent per ounce, and 2 cents per 1/4 ounce.
  - Turkey, by Bremen or Hamburg—1 1/2 cent per ounce, and 5/8 cent per 1/4 ounce.
  - Greece, by Bremen or Hamburg—1 1/2 cent per ounce, and 5/8 cent per 1/4 ounce.
  - Gibraltar, Spain and Portugal, by Bremen or Hamburg—1 1/2 cent per ounce, and 2 1/2 cents per 1/4 ounce.
  - Austria, India and China, by Bremen or Hamburg mail, by way of Marseilles—1 1/2 cent per ounce, and 6 cents per 1/4 ounce.
  - Austria, India and China, by Bremen or Hamburg mail, by way of Trieste—1 1/2 cent per ounce, and 2 cents per 1/4 ounce.
- These charges are in each case in full to destination, combining rates between the United States and Bremen or Hamburg, and the rate beyond Bremen and Hamburg to points of delivery.

**THE NEW YORK ELEVATED RAILWAY.**—The first mile of the elevated railway in Greenwich street, New York, will be completed in about a fortnight. The road runs upon a series of columns, eighteen feet above the sidewalk; and is by this means removed from all interference with the ordinary traffic of the streets. The columns are of wrought iron, and placed at distances varying from twenty-five to thirty feet apart. The motive force is an endless wire rope between the rails, moved by a stationary engine. Certain catches are placed along the rope at intervals of about 200 feet, to which cars may be attached.

**National Mineral Land Law, Instructions, Blanks, Etc.**

Copies of the Act of Congress, approved July 26th, 1866, relating to the Location of Mineral Lands, together with the instructions to the "United States Registers and Receivers and Surveyors General," from the Commissioner of the General Land Office Department of the Interior, dated at Washington, Jan. 14th, 1867, can be had at this office. Also a full set of blanks for making applications, advertising, etc. Address DEWEY & Co., office Mining and Scientific Press, San Francisco.

**THE PACIFIC IRON WORKS,**

First & Fremont Sts., between Mission & Howard, San Francisco.

The proprietors of the above Works invite the attention of all parties interested to their greatly improved and unequalled facilities for manufacturing Steam Engines and Boilers, both Marine and Stationary, of any required size and pattern, Quartz Mills, Amalgamating, Pumping and Hoisting Machinery of the most approved construction. Flour, Saw, and Sugar Mills, Water Wheels, &c., &c. Our pattern list is most complete and extensive, embracing the late improvements in all classes of machinery adapted to use on this coast. We would call special attention to the fact that we have secured the exclusive right of manufacture for the Pacific Coast of the celebrated Greene Engine, conceded to be the most economical and perfect working Engine now in use. We are also exclusive manufacturers of the celebrated

Bryan Battery, Varney's Amalgamators and Separators, Ryerson's Superheated Steam Amalgamators and Rotary Crushers, Stone Breakers, &c. Orders respectfully Solicited.

**FIRST**

**Paint Manufactory IN CALIFORNIA.**

**EPES & E. H. R. ELLERY**

Have the Patent Right for the Pacific Coast to manufacture, sell and use

**Ellery's Patent India Rubber Cement & Paint.**

It is for all exposed surfaces; impervious to wet; will not rot, peel, blister or crack, in any climate. A superior Paint for brick, wood, cloth, metals, etc., successfully used in the Eastern States. The old tin roof of that large building, the New York Rice Mills, was in such bad condition it was about to be taken off long since. Instead, they put on the INDIA RUBBER CEMENT AND PAINT, making a roof tight. A coat of India Rubber Paint every two years since keeps it in good condition. We can refer to many others. The Atlantic Lead Works use our Paint only.

NEW CLOTH ROOFS put on; copings and all seams cemented and saturated, then coated with the India Rubber Cement and Paint—the same as on the St. Nicholas Hotel at New York City, the City Buildings and many others, the roofs of all the horse and steam cars, decks of steamboats, etc., around New York—or eight dollars per one hundred square feet. A FEW OLD TIR ROOFS repaired and painted with the India Rubber Cement and Paint guaranteed, at from one cent to two and a half cents per square foot, according to size and condition of roof. Good men and the best materials used.

We have just completed and painted old tin roofs of Dr. H. D. Cogswell, Tubbs & Co., D. J. Oliver, etc., and the wood work of Sheriff Davis' building, 88 feet front, on Folsom street, between Third and Fourth streets—only one coat. The work will speak for itself. Now painting the cornice and iron work of Dr. H. D. Cogswell's building, corner of Front and Clark streets—one coat. See the above and further references at our office.

ELLERY'S PATENT INDIA RUBBER CEMENT AND PAINT is composed of India rubber and other gums, dissolved in linseed oil, mixed with the various coloring matters and ground in any color. When applied to roofs or other purposes, it is mixed with pure linseed oil to the required thickness and put on as other paints are, with a paint brush—retaining sufficient elasticity to give and take with the heat and cold. Pile up your tin vessels at Cape Ann use the India Rubber Paint, finding it superior to all others.

EPES & E. H. R. ELLERY are now prepared to make good roofs, and cement and paint new or old roofs, and do all kinds of outside painting with Ellery's Patent India Rubber Paint. No asphaltum or coal tar used. Office, No. 226 Jackson street, corner Battery, San Francisco, Cal. 6v15

THE GOLDEN ERA.

Founded in 1852, it is the oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent.

THE GOLDEN ERA

It is the most universally popular of all the Weekly journals. It presents forty-eight columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected matter. It is a welcome guest in Cottage and Cabin; the favorite at the fireside in city and country; the most useful, agreeable and altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe and elsewhere. Every household in the mountains and valleys, the cities, towns and mining camps of California, and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor. Inspired with the genius of the age, it is progressive, and aims not so much at distinction as a newspaper, as at honorable success in its capacity of a great Moralizing and Improving Influence, Exercising a positive power for good, and wielding a permanent influence, many able and eminent writers choose its columns as a means of communicating with the public. No effort will be spared to make it a thoroughly California newspaper, and worthy of the support of all classes of our citizens.

The nature of its character and reputation of its constant patrons throughout the entire coast is one of the best recommendations of its merits and value as a medium of intelligent progress and prosperity. DEWEY & CO., Proprietors. Mining and Scientific Press Patent Agency, Newspaper, Book and Job Printing Office, 505 1/2 Clay street, San Francisco.

SUBSCRIBERS who do not receive the Mining and Scientific Press in due time, are requested to inform the publishers.

Life Insurance--The Money Drift.

EDITORS ALTA--I send in your issue of the 11th, a very important statistical paper, compiled by you from the Federal revenue returns, which proves the astounding fact that the distant Life Insurance Companies plying in California through "Agents," draw away nearly one million dollars per annum.

The drain under this head, as you state it, amounts to-- Year ending 1st August, 1885, \$2,293,261 Year ending 1st August, 1887, \$7,261,261

And as we write the drain increases and must be now near a million a year--to be a million and a half next year, and so on.

And you naturally ask with surprise why this matter has not been taken in hand by some of our enterprising insurance men, so as to arrest the flight of a moiety at least of this enormous drain.

I think, sirs, your question is well put, and though my hands are full, I am yet willing to stop forward and assume some of the responsibility and bear some of the preliminary expenses of forming such a Company.

When you reflect, sirs, that this million dollars a year is carried over land and sea, thousands upon thousands of miles, to places where it is lent out by distant Managers and Directors to their manufacturing and commercial friends around them, at five per cent, per annum, while our merchants and manufacturers, who are to compete with these, have to pay after per cent, per annum for money (we supply them with the golden weapons to beat us) you will then conceive the magnitude of the injuries effected by the sapping and mining operations of those distant Insurance Companies.

The money which must drain away, day by day, steamer after steamer, from our people, will not stop, impoverish this country quite as much as if it were conquered by a foreign power and held in perpetual tribute. A million a year, by compound interest, will be ten millions in five years, twenty millions in ten years, forty millions in fifteen years, eighty millions in twenty years, one hundred and sixty millions in twenty-five years, three hundred and twenty millions in thirty years! I will admit that the ordinary percentage of deaths on a business of thirty years will effect a drawback of one-third of the income, which in thirty years we will put at one hundred millions. Notwithstanding this, if we go on at our present scale of draining, we shall in thirty years lose by the insurance operation two hundred millions of dollars! But our drain, if we don't stop it, will not stand at one million a year; it will increase year after year from one million a year to two millions a year, which, by my foregoing computation, would in thirty years foot up to four hundred millions! What it would amount to in sixty years I leave to other calculators. In round numbers, I should guess it would come to the full number of dollars equaling the national debt of the United States!

Now, sirs, I care not what may be said of me by critics or jealous opponents, some of whom cannot see farther than their own noses. I announce myself as ready to make an effort to stop this drain, and I hold every man who co-operates with me a benefactor of his adopted country.

Let the capital of a Local Life and Health Insurance Company be one hundred thousand dollars to begin, in shares of one hundred dollars each. I shall cheerfully take the names of co-operators in a book opened this day, in the office of the California Building and Savings Bank, California street, for that purpose.

I remain, your obedient servant,

THOMAS MOONEY, Building and Savings Bank, California street, November 12th, 1887. 20v15-4v

BEAN'S HISTORY AND DIRECTORY OF NEVADA COUNTY, CALIFORNIA. Containing a complete History of the County, with Sketches of the various Towns and Mining Camps, the Names and Occupation of Residents; also, Full Statistics of Mining and all other Industrial Resources. Postponement--The day for deeming stock delinquent on the above assessment is hereby postponed until Wednesday, the first day of January, 1888, and the sale thereof until the twenty-second day of January, 1888. By order of the Board of Trustees.

T. W. COLBURN, Secretary. San Francisco, Nov. 27, 1887. no9

Machinery.

VARNEY'S PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the PACIFIC FOUNDRY, San Francisco.

Hunt's Double-Action Pump

Is cheap, durable, strong, and not liable to get out of order. Built and on hand at No. 23 Second Street, and 108 Jessie Street. 14155ft E. O. HUNT, Prop'r.

E. T. STEEN,

Commission Agent for the purchase and sale of

Engines, Boilers, Castings,

AND ALL KINDS OF MACHINERY.

No. 537 Washington, and 532 Merchant St., San Francisco. HAS FOR SALE

- One Engine, 5-Horse Power, \$100
One Engine with Boiler, 7-Horse, 600
One Engine, Link for Hoisting, 15-Horse, 800
Two Engines, Boilers, Port., 16-Horse, 1,200
One Engine, 40-Horse, 1,200
One 30-Horse Roller, 300

Also, a great variety of

Boilers and Machinery,

CASTINGS OF ALL KINDS.

AT LESS THAN MARKET RATES.

Parties wishing to purchase or sell Machinery, of any kind, can do so to advantage through this agency. 12155ft

Steam Pumps,

FOR DRAINING MINES OR ELEVATING WATER TO ANY HEIGHT.

PICKERING'S GOVERNORS

For Steam Engines.

Giffard's Injectors,

For Feeding Boilers.

STODDART'S IRON WORKS,

Beale Street, San Francisco. 2512 3m

PATTINSON'S

HURDY-GURDY WATER-WHEEL.

The inventor of this Wheel having, after much delay, finally obtained the patent for the same, is prepared to sell rights therefor to such as may be desirous of putting them up, or continuing those already in use. This is well known among miners as the "hardy-gurdy wheel," and is considered the most economical Water-Wheel now in use.

Notice is hereby given, that the subscriber is the inventor and holds the patent right for the construction and use of the same; and that no person has a right to manufacture or use them without his permit. 7145-97 THOMAS PATTINSON.

Brodie's Patented Improvements

FOR THE TREATMENT OF

Gold and Silver Ores.

BRODIE'S PATENT IMPROVED QUARTZ CRUSHER. The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and Durability. In consequence of these advantages, the advertiser is enabled to offer these machines to the public at the following low terms: No. 1-Or 4-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut-price, \$300

No. 2-Or 15 inch Crusher, capable of similarly putting through five to six tons per hour, price, \$500 No. 3-Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour, price, \$1,200

The frame is made of cast iron, bound with heavy wrought iron bands, making it very strong, and at the same time light and portable. The crusher is bolted to a wood frame of sufficient height to clear the fly-wheel, and allow the crushed quartz to pass off. The dotted lines show the movable and stationary jaws. Letter A represents the eccentric shaft by which the power is applied direct to the movable jaw. B represents the link or radius bar. C represents the bolts for regulating the opening. F, which can be regulated at pleasure, so as to graduate the size to which it is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designated.

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, B, gives the movable jaw, B, a forward and downward motion at the same time, and which makes the hardest rock yield and separate into fragments of any desired size.

The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, R. White Ranch, Tuolumne county, Excelsior Mine, Lake District, Nevada, and in other parts of the country, in operation at the Fulton Foundry, First street, San Francisco. The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Rawhide Ranch" Mine, in the "Sierra Nevada" Country: RAWHIDE RANCH, Tuolumne Co., Sept. 20, 1866. JAMES BRODIE, Esq., San Francisco-My Dear Sir: It gives me pleasure to inform you that I have for the past three months had one of your largest sized Rock Crushers in use, at the Rawhide Ranch Mining Company's Mill, which has entirely met my expectations; and I have no hesitation in recommending it to all who are in need of a machine for rapidly, cheaply and properly processing quartz for the stamps. Yours truly, R. P. JOHNSON, Supt. Rawhide Ranch Quartz Mill.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL. This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.

For the present it is not intended to grant licenses for the use of the Improved German Barrel, for a longer term than twelve months. All persons desirous of compromising, without having recourse to legal proceedings, for partnerships, or divisions of interest, or for Licenses for the limited period named, are requested to address below. A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1866.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING. This Dry Crusher has been recently invented, and is a most economical and effective mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations afforded on application to the subscribers.

For a full and complete description of this machine, will be found in the Mining and Scientific Press of Sept. 22d, 1866. JAMES BRODIE, Esq., Fulton Foundry, San Francisco. CHARLES RADCLIFF, Express Building, 402 Montgomery Street, San Francisco.

E. O. HUNT,

Manufacturer of

Windmills, Horse-Powers, Pumps, Pumping Frames and Gearing.

HUNT'S ADJUSTABLE WIND MILLS to have all the sails so arranged as to turn edgewise to the wind when the mill is stopped. The sails can be set at any angle to suit the force of the wind, and when the mill is running, by means of the brake lever at the foot of the mill, by any person.

HUNT'S SELF REGULATING MILL is strong, durable and cheap. It is provided with means for stopping, in the most violent winds, and will never be blown through-out the State.

Tread Horse-Powers, Swap Horse-Powers, Pumps in great variety, Single and Double-Acting. Frames and Gearing for running pumps, from steam or other power, constantly on hand and built to order. Water Tanks built to order. No. 28 Second St., and 108 and 110 Jessie St. San Francisco. 12155ft

DR. BEERS' PATENT

WIRE GAUZE AMALGAMATOR.

THE ATTENTION OF QUARTZ, HYDRAULIC AND Precious Minerals, is called to this new invention for saving Fine Gold. It is designed to furnish the miner with a cheap and simple apparatus by which the finest freeness can be saved without loss, requiring little attention, the machinery to drive it, and will positively collect every particle of amalgam, or of waste mercury that may have escaped from mill or sluice, and as these particles are always charged with more or less gold, this item alone, in many instances, will more than pay the cost of this Amalgamator every month. For Circulars, and further particulars, address Dr. J. B. BEERS, San Francisco, Per Wells, Fargo & Co's Express. 11165 6m

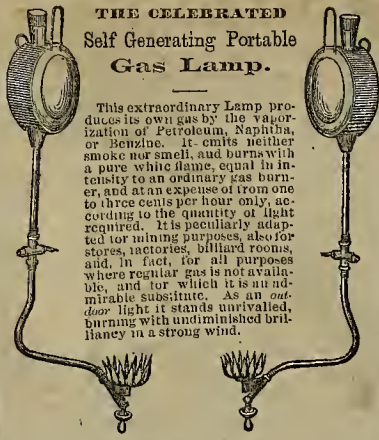

NELSON & DOBLE,

AGENTS FOR

Thomas Firth & Sons' Cast Steel, Files,

Etc., Shear, Spring, Ocrman, Plov, Blister and Toe Calk Steel; manufacturers of

Mill Picks, Sledges, Hammers, Picks, Stone Cutters', Blacksmiths' and Horse-Shoers' Tools, 319 and 321 Pine Street, Between Montgomery and Sansome, San Francisco. 10149ft

THE CELEBRATED Self Generating Portable Gas Lamp.

This extraordinary Lamp produces its own gas by the vaporization of Petroleum, Naphtha, or Benzine. It emits neither smoke nor smell, and burns with a pure white flame, equal in intensity to an ordinary gas burner, and at an expense of from one to three cents per hour, only, as required. It is peculiarly adapted for mining purposes, also for stores, factories, billiard rooms, and in fact, for all purposes where regular gas is not available, and for which it is an admirable substitute. As an outdoor light it stands unrivaled, burning with undiminished brilliancy in a strong wind.

Directions for Use.

Charge the reservoir with the prepared fluid, or with Benzine, from half to three-fourths full; allow a portion to run through into the cup, then turn off the tap, and ignite the fluid, which will heat the burner sufficiently to generate the gas, which will be seen issuing from the top. The tap must now be turned on, and a steady light will be maintained till the whole of the contents of the reservoir is consumed.

A small needle, bent at the point and fixed in a holder, may be occasionally required to clear the minute hole through which the gas issues, and the regulating screw at the bottom turned a little back; but care must be taken not to force the screw too high, and it should never be used to extinguish the light-by turning the top off, it will gradually go out.

When necessary to renew the cotton which is placed in the lower pipe to prevent the too rapid flow of the fluid, the lamp should be placed in a vise and the burner screwed off. The burnt-cotton must then be withdrawn, and a fresh piece of stout cotton rag, one inch wide and four or five inches long, should be doubled over a piece of wire, and inserted into the pipe-the ends cut short off; the burner again screwed on with a little white lead, and the lamp is ready for use.

Manufactured solely by JOHN J. HUCKS, original proprietor, Factory, North Beach, San Francisco; and for sale by his agents in every city and town throughout the State. 1814-3m-8

LEFFEL'S American Double Turbine

THESE WHEELS, UNEQUALLED AND UNRIVALED IN THE United States or the world, have been fully tested on this coast, more than forty being in use at this date in California and Oregon, driving all kinds of machinery, Saw Mills, Flour Mills, Quartz Mills, etc., etc. CALIFORNIA REFERENCES.-E. SUPERIOR CUT-OFF ENGINES.

We desire to call the attention of Engineers, Manufacturers, and Millmen, to the celebrated

Hartford Engine,

With Wright's Patent Variable Cut-off, which we are now manufacturing under a license from the Woodruff & Beach Iron Work Co., Hartford, Ct. To parties wishing a First-class

Fuel-Saving Engine,

Simple and durable in construction, this Engine is offered in the belief that it is superior to any other manufactured. It enjoys the very highest reputation in the Atlantic States, where it is well known; over 300 of them having been built by the Woodruff & Beach Company, and being now in successful operation.

GODDARD & CO.,

Pacific Iron Works, 915ft, San Francisco, Aug. 29, 1867.

NOTICE TO MERCHANTS

AND MANUFACTURERS.

Moore's Patent Friction Hoist.

Now in successful operation in the principal stores in San Francisco, possesses many advantages over the common Hoist-viz: Greater strength; less danger in working, as goods require no slinging or handling, consequently make fewer breakages; requires one man less to operate it; stops with the load at any point, without any fastening or attention from the operator.

The undersigned take this opportunity to notify all whom it may concern that they have secured, by letters patent, the application of a friction pawl, or stop, to hoisting machines, and that they will prosecute any party making or using any machine infringing upon the same. VULCAN IRON WORKS CO. By JOSEPH MOORE, President. JOSEPH MOORE. 21165 ft

Manufacture of Black Lead Crucibles.

The manufacture of black lead crucibles, and their extensive use in California by the United States Mint and by assayers, for melting gold into bars, and the demand for the larger size for forming our silver bricks in Washoe and other silver districts, is an important item. Such crucibles are also largely used by brass foundries. Many veins of black lead have been discovered in California, and samples have been sent East; but this article has never yet been produced here of the right quality for the manufacture of crucibles. Their manufacture has never been attempted here, except as an experiment. There are but one or two even of our Eastern manufacturers who have arrived at that degree of perfection in this art that enables them to turn out a crucible that will stand the great heat to which they are necessarily subjected, and particularly to endure a number of successive melts, as is expected of a good article.

The crucibles made by Joseph Dixon & Co., of Jersey City, have the best reputation in California. Indeed, their reputation is world-wide; they are even found superior to the English and French, and are exported to Europe and employed, in many places, in preference to those made there. It requires much care and experience to select the right quality of black lead for this manufacture, and to get the right proportion of mixture with other materials to form an article to stand the greatest amount of heat.

Messrs. Dixon & Co. claim a great degree of skill in their manufacture, and more or less secrecy in their mixtures. This firm also manufacture a very superior article of stove polish.

Messrs. John Taylor & Co., of this city, have imported large quantities of these crucibles and stove polish, and supplied the greater portion of the demand for those articles on the Pacific Coast since 1852. We clip the following description of the works of the Messrs. Dixon & Co. from the New York Evening Mail:

Perhaps, away from the immediate vicinity of New York, Jersey City is best known as the place from which come the famous black lead, or plumbago crucibles which are now so extensively used the world over. There are two manufactories of these, and as one of them is the originator of all such establishments in the country, it is but just that it should be reviewed and described first. We refer to the well known Crucible and Stove Blacking Works of Messrs. Dixon & Co., located on Railroad avenue, something more than a mile from the ferry. In the year 1827, Mr. Joseph Dixon, the originator of the firm and of the business, began the making of plumbago crucibles at Salem, Mass. It is a remarkable fact, that previous to that time plumbago from Ceylon had long been looked upon in the light of a very beautiful mineralogical specimen and of no practical use, as it was too coarse for use as lead pencils. But Mr. Dixon conceived the plan of making crucibles of it for the smelting of metals, and the first lot of plumbago, only a few tons, was brought to Salem in 1827 by Captain Joseph Rogers, a prominent Indian agent of that city, which, it may not be remembered, at one time had the monopoly of the American India trade.

It required twenty years to drive the foreign crucibles out of even the American foundries, as many of the workmen then employed were foreigners. In 1847, the business was begun in Jersey City, where it has grown to its present proportions. The plumbago is brought from the mountains of Ceylon, and is mixed with clay brought from Bavaria, and then is made into crucibles upon wheels, precisely as pottery or stone ware is turned out, and is baked in a kiln in the same manner. Messrs. Dixon & Co. have sent out something over two millions of these crucibles since the works were started. This year the number will probably be two hundred and fifty thousand. They are made of all sizes, from those to contain one pound of brass up to six hundred pounds. They have been used in our Mint for twenty years, and for fourteen in the French and English. Years ago certificates were received from both these mints attesting the great durability and excellence of these crucibles. The director of the Fye-wood Works at Rotterdam says he has

melted nearly 3,000 pounds of pieces of cannon and copper in one of these crucibles, while to melt the same amount of metal would have required at least seven or eight German pots.

AN INTERESTING RELIC.—The original log book of the Fulton, which made the first steam voyage across the Atlantic, is in the possession of Capt. Charles H. Townsend of the Havro steamship Fulton.

THE Mexican Mountain of San José is one vast silver mine. There are no veins. From any part of it rock can be taken producing from \$40 to \$100 per ton.

DEEP.—A cavern and subterranean lake, whose depths cannot be fathomed, have been found in Wyandot county, Ohio.

FRUIT is the antidote of fevers, and both come in the same season. The best remedy for the bite of a rattlesnake is lobelia, which grows around its den.

LESS skill is required to make whisky than vinegar. In Germany, they have a vinegar school where the student graduates in four months.

THE Nova Scotia gold mines are now yielding more abundantly than at any previous time, and the work of developing them is being prosecuted with great vigor.

GOLD mining is about to be commenced at Bluffton and Huntington, Ind. At the latter place a quartz mill is being erected at a cost of \$10,000.

**THE NEW CRUSHING PROCESSES AT MARIPOSA.**—We understand that Prof. Silliman, one of the principal proprietors and managers of the Quail Hill Mining Co., a few weeks since, sent two tons of the ore from that mine to the mill at Mariposa, to be treated by the process now in operation there—dry crushing with stamps, and final pulverization by the ball and barrel process. The ore, such as sent, when worked at the mine by the ordinary stamp mill process, yields about \$5 to the ton. The yield at Mariposa, we are informed, was \$15 to the ton. It was put through the barrels in three charges of about 1,300 pounds each. The yield of the separate charges was very nearly equal. This experiment is considered a very fair test of the relative value of the two processes. The yield was increased from \$5 to \$15 per ton. Of the relative cost we have no knowledge; but from the statements of the owners of the Mariposa process, it can bear no manner of proportion to the reported increase of yield. The character of the ore, however, is extremely favorable for exhibiting a marked contrast between the two modes of working—it being a highly decomposed sulphuret, containing extremely fine gold, a large portion of which must unavoidably be washed away by the large quantity of water necessarily employed in the wet process of stamping.

We give the above from hearsay. If it is half true, we shall soon hear of the Mariposa process being adopted at Quail Hill. If no change is made in the works there, we may reasonably infer that we have been misinformed with regard to the main facts in the case.

**COX'S CEMENT MILL** continues to work satisfactorily. One of the mills has been in constant operation at Jeffersonville, near Jamestown, Tuolumne county, for some three months. The gentleman upon whose claim it is located, says that thirty-five tons of ordinary cemented gravel can be put through it in twelve hours, and if the gravel is not very hard, forty tons may be worked in the same time. His works are so arranged that one man attends to the entire work. Another company, in the same vicinity, have become so well satisfied with regard to the value of this improved manner of working cement, that they will probably soon procure one for their mine. The Grass Valley *National* says that the Hope Gravel Mining Company of Grass Valley, are putting up one of these machines at their mine on Alta Hill, which will be in operation by the middle of December. There can be little doubt but these machines are calculated to add greatly to the economy of cement working, and that they will eventually render profitable much ground that cannot be worked at present on account of the cost of stamping, or loss of gold entailed by the ordinary process of sluicing.

**HANSBROW'S CHALLENGE**  
**Deep-Well, Mining and Double-Cylinder Patent Pumps.**

These Pumps combine all the advantages of the common Lift and the Double-Acting Suction and Force Pumps, and are equally fitted for all—Household, Farm, Mill, Manufactory, Brewery, Ship, Railway, Mining, and other purposes, and are especially recommended on account of their lightness, compactness, durability, cheapness, and the facility with which they can be placed in any position.

They are adapted for Hand, Steam, Horse, Water, or Wind Power. They are more durable in all their parts than any other Pumps of the same power.

**Four-Inch Deep-Well Pump.**

The Valves are of the simplest construction, and can be readily taken out by loosening two common nuts. They are not liable to get out of order, and can at all times be removed without the aid of a skillful mechanic.

The lower valves of these Pumps work upon inclined seats, which prevents sand or other matter that the Pumps may take up, from remaining under the valves; or stopping the flow of water.

These Pumps are worked with less friction, and consequently require less power than any other Double-Acting Pumps of equal capacity.

All sizes, from 2-inch to 8-inch Cylinder, manufactured by the Pacific Iron Works, GODDARD & CO., and for sale by the Agents,  
**LOCKE & MONTAGUE,**  
112 and 114 Battery Street, San Francisco.

Mining Shareholders' Directory.

## Carvalho's Improved Steam Super-Heater.

Every engineer is fully aware of the great superiority of dry over wet steam, and numerous contrivances have been from time to time devised to more perfectly and economically attain this end. Different forms of boiler construction, such as steam drums, pipes on the interior of the up-takes of furnaces, etc., are the most common means employed; but, despite the most carefully constructed furnace and boiler, a large amount of water will find its way into the engine cylinder and greatly interfere with its proper work, causing it to labor and thump. This is not at all to be wondered at when we consider that nearly all the steam generated in boilers, of whatever make, must necessarily pass through a greater or less depth of water before reaching the steam place or chamber, and so become mechanically charged with moisture. A large proportion of this moisture unavoidably finds its way to the engine, when no super-heating apparatus intervenes. That such may be the case, even when all parts of the machinery are brought to a proper degree of temperature, is often apparent in a most aggravating manner, when, for some cause or other, foaming of the water (priming) is induced. In addition to these troubles, the evil is generally seriously increased by the rapid condensation of steam when so conditioned. Moreover, the water so carried over with the steam, has been highly heated at the cost of much fuel, which, instead of being converted into power, is actually made to operate as a detriment thereto.

Of late years, various plans have been devised for passing the steam, on its way from the boiler to the engine cylinder, through the fire-box, for the purpose of converting the wet or saturated vapor into dry steam. This process is usually termed "super-heating," and by it not only the vapory matter, commingling with the steam, is converted into pure steam; but a much greater degree of elasticity is also given to the entire amount of steam generated, while its temperature is so materially increased as to preserve it from condensation in the steam pipe and cylinder, which always takes place, to a greater or less extent, in working saturated steam. An engine always works easier and with less steam, when dry steam only is allowed to pass into the cylinder.

The illustrations which we give herewith

represent what is probably the best, simplest and cheapest device for super-heating steam which has yet been devised. It is known as "Carvalho's Patent Steam Super-Heater." Fig. 1 represents the super-heater with a portion of the shell taken away, so as to show the manner in which it is prepared inside—being filled with coiled wire. By this arrangement, every portion of the steam is compelled to come in contact with a dry,

beater, so increased in temperature as to fulfill the conditions already described as so essential to the proper working of an engine. A represents the connection with the boiler, while B connects with the engine cylinder. These connections are fully seen in Fig. 2, which presents a side view of the boiler. The super-heater, as will be seen, is placed about midway between the fire-bridge and the rear of the boiler, so as to take up waste

CATALOGUE OF THE MECHANICS' INSTITUTE LIBRARY.—The Mechanics' Institute, for the first time in its history, has just issued a full and carefully prepared catalogue of its library. It appears from the statement of the Librarian, J. B. Pierce, that the subject of preparing a catalogue has been considered at various times for the past seven years; but for one cause or another has been deferred until the present time. The present catalogue was mainly arranged and prepared about a year ago by Mr. R. R. Lloyd, the late additions having been made by Mr. Pierce, and errors corrected as far as discovered. The opening pages contain a list of the officers of the Institute, a copy of the constitution and by-laws, rules and regulations of the library, reading room, chess room, etc.

The catalogue is divided into two parts—the first being an alphabetical list of authors, each name followed by an alphabetical list of works by that author. The second part contains an analytical list of books, arranged by titles, with names of authors appended, so far as known. This portion of the catalogue is divided into 21 classes, with a supplemental list of books received since the manuscript was put into the hands of the printer. The classification of the works has evidently been made with much care and most excellent judgment. By the aid of this catalogue, any person at all conversant with books may most readily find any work in the library, upon any subject which he may have in mind. Every member of the Institute should provide himself with a catalogue of the library. It will be found a great convenience in the selection of read-

CARVALHO'S IMPROVED STEAM SUPER-HEATER.—Fig. 1.

SECTIONAL SIDE VIEW.

SECTIONAL END VIEW.

beating surface. Without this metallic filling the steam would rush through in an undisturbed column, in such a manner that the outside of the column only would be brought in contact with a heating surface. By this contrivance, every particle of the vapor contained in the steam is first converted into true steam, which steam is, in its subsequent travel through the super-

heater in position. The boiler and engine connections will be readily seen in both figures.

In addition to the advantages enumerated above, they also effect an important saving of fuel, admit of the employment of steam at a lower pressure, and thereby diminish the strain upon the boilers and lessen the danger of explosion. They have been very extensively introduced into use at the East, where they are giving great satisfaction, as is shown by the high character of the testimonials exhibited by the agent here, some of which will be spread before the readers of the Press, through its advertising columns, in a few weeks.

Mr. Robert L. Harris is the agent for the manufacture and sale of these super-heaters for the Pacific Coast. He may be found at the Aetna Iron Works, in this city, where they are manufactured and sold, and where one of them may be seen in use. They can be readily attached to any boilers, new or old, at a small cost.

GOOD PAY.—The present proprietors of the *Atlantic Monthly* have made \$200,000 out of it since they took hold of it.

ing matter, and by its assistance much work may be leisurely done at home, which must otherwise be done at great inconvenience and loss of time, at the library. The cost of printing is to be reimbursed to the Institute by the sale of the catalogues at 50 cents each.

TAKEN DOWN A LITTLE.—By reference to the reported proceedings of the Academy of Sciences, on Monday evening last, it will be perceived that our Sacramento friends will have to come down a little in their hitherto claimed altitude over the Bay City. According to the remarks of Mr. R. L. Harris, there has heretofore existed an error of no less than *thirty-five feet* in the supposed elevation of the State Capital above the tide level. The Pacific Railroad, too, will observe that they have not taken a locomotive quite as high as heretofore reported; yet, they can afford to come down a little as long as they can still claim to have run the iron horse to a higher elevation than it has ever before reached in any part of the world. Some important facts and considerations with reference to the tule lands will also be found in our report of the Academy's proceedings.

## Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[By our Special Correspondent.]

## General View of the Paris Exposition of 1867.

By W. P. BLAKE, Commissioner from the State of California

(Continued from page 337.)

## TOOLS FOR BORING SHAFTS.

It is unnecessary to describe the various forms of augurs and drills for boring artesian wells, displayed in the French section. They are not superior to those now in use, with us for sinking oil wells. But there is another class of boring tools used for opening shafts in soft ground or in stratified formations that can be easily perforated, and where quantities of water are encountered. These tools are enormous reamers or drills, from six to twelve feet across the face, so that they will open circular shafts of the same dimensions. They are made of wrought iron and weigh many tons. A massive cross-head is armed with stout steel cutters, like teeth, set in rows at the outer ends and projecting downwards. A small guide hole being first bored into the earth, these larger tools are made to follow and enlarge it. At the same time the shaft is lined by a water-tight curbing or cylinder of wrought iron, made in short sections, one bolted upon another by means of flanges, which descend as the shaft progresses. The lower section is made double, and the space is so filled in with moss or tow that it makes a water-tight joint, and excludes all water from the shaft except that which enters at the bottom. This is the method or invention of Messrs. Kind & Chaudron, and has been tried with success at the coal mines of St. Avold and d'Hopital. It has received a grand prize.

## MACHINES FOR EXTRACTION.

Hoisting engines and apparatus are found only in the French and Belgian sections. In the former, the most conspicuous is a machine with double vertical engines, and the winding reels or bobbins high in the air above them. This is from the establishment of Quillac, at Auzin, which has turned out a large number of powerful engines of similar construction, for the French coal mines. They claim to have supplied 67 machines, of the aggregate horse power of 7,012, since 1856. One of 500-horse power was for pumping. The cylinders of the engine in the Exhibition are about three feet diameter, and six feet stroke. They are connected directly with the bobbin shaft above, without gearing. This shaft carries two bobbins, 22 feet in diameter, intended for flat wire or hemp cables. The wooden arms of these bobbins are united at their extremities by segments of iron. The engineer stands on an elevated platform and looks under and between the bobbins towards the mouth of the shaft. The movement is controlled by link motion, and the brakes are operated by steam. The poppet heads, pulleys and frame work, to be placed over the mouth of the shaft, together with the cages, guides and wagons are shown, in connection with the engines, and the whole forms the most complete and attractive-looking hoisting apparatus exhibited, but it is questionable if this vertical arrangement is so desirable as the horizontal. Another hoisting apparatus in the Belgian section, has the bobbins placed below the cylinders, the shaft being on the level of the floor, and the cylinders inverted above it. The engineer of the machine stands above the whole, and has an unobstructed view of the shaft and the pulleys above it.

There are also two or three beautifully finished horizontal hoisting engines, all of them double and direct-acting upon the bobbin shaft. Some of the bobbins are provided with light wrought iron segments to connect the spokes. Most of the machines have friction hands suspended around a central or outer wheel, made specially for the purpose. Those hands are operated by steam. Other machines have brakes instead of metal bands. These are merely segments of wood set in iron frames and drawn forcibly against the opposite sides of a friction

wheel, on the main shaft, by means of levers also operated by steam. The power varies from 80 to 150 horses.

Much care is bestowed upon the construction of indicators to show the engineer the exact position of the cages in the shaft. Geared wheels connecting with the bobbin shaft give motion to a long horizontal screw, which moves indices back and forth directly under the eye of the engineer, and rings bells as the cages near the top or the bottom of the shaft.

The machines which I have noticed all have a very light, airy appearance, and are somewhat in contrast with another machine shown in the Park, in the building devoted to the productions of the great establishment of Creuzot. This is made for the coal mines of Blanzay, to perform very heavy work, and is made very strong and solid. It is horizontal, double engines and direct-acting. The cylinders are very long, and are placed some 20 feet apart. Bobbins for flat cable and 20 feet diameter; the spokes of which are not connected by metal rims.

## CABLES.

Some very heavy and well made flat wire cables are shown in the French and Belgian sections. In the Belgian, some are made of ordinary round wire cables, one inch in diameter, and united side by side, and are long enough for mines 2,800 feet deep. It is claimed that this is an improvement over the usual mode of laying the flat cables, and that it permits more rapid winding. I did not see, however, any better samples of light wire rope work than those shown in the United States section by A. S. Hallidie & Co., of San Francisco.

## CAGES AND WAGONS.

The system of using cages of several stories, so as to take wagons one above another, is being abandoned, as much as possible, for the broad cage, to receive the wagons upon the same level. This of course necessitates a larger shaft, but the saving of time, trouble and wear, is very great over the other method.

Nicholas Libotte, of Belgium, exhibits some very well made cages, made wholly of wrought iron, intended for the mines of a coal company near Liege, Belgium. They are made to take two tiers of wagons, three on each, or six wagons in all. The cage weighs 1,268 kilo., about 2,536 pounds, and the parachute attachment, 328 pounds. Another cage is constructed to take six wagons, one above another—total weight, including parachute, 3,124 pounds. The wagons intended for this cage are about six feet long and two feet six inches wide. The guides in the shafts are intended to be made of wood, and the slides or bearings on the cage are made of steel. All the cages shown are provided with safety parachutes, not differing particularly from those already often described.

## CRUSHING AND DRESSING MACHINES.

The only ore crushers shown are Blake's rock breaker, and the well known Cornish rollers, the former being exhibited by the assignees of the patent in France, in the French section, and received a gold medal. The same parties show self-acting and discharging jigs, modifications of the Cornish machine, with the grates fixed and the water forced up through them and the ore by a plunger. These are made entirely of cast iron, and were operating very well upon lead ore. A table for dressing fine ore is made of an endless belt of canvas, which moves in a direction opposite to the flow of the ore, and at the same time receives a shock or percussion. With the exception of the percussion, the arrangement is very similar to one tried by Mr. Williams, at the Benton mill, some years ago, and abandoned as unsatisfactory.

Paris, Sept. 25th, 1867.

In France Government raises all kinds of improved stock for sale, and prohibits farmers from doing so. No agricultural societies are allowed, for Government does all this business, and there cannot be a meeting of more than 20 persons for any object whatever, without consent of the Government.

A POWERFUL EXPLOSIVE.—Ehrhardt's safety powder, the Prussian invention, is used with great success in blasting away the rocks obstructing Boston harbor. Eight pounds of it in six days removed 150 tons of rock, while 520 pounds of ordinary powder and 39 days' labor disturbed only 20 tons.

A PECULIAR carriage, with wheels ten feet in diameter and sails, has been constructed in St. Louis, for use on the plains. It can be used as a boat in crossing.

[Written for the Mining and Scientific Press.]

## The Freiberg, or Barrel Process, for the Reduction of Gold and Silver Ores.

BY PROF. ROWLANDSON, F. G. S. L.

NUMBER FOUR.

## GENERAL RESUME OF THE PROCESSES DESCRIBED.

Seven different modes of reducing silver from its ores have been described, which, including the Washoe pan method, would comprise five which are associated with the employment of mercury as the chief and final reducing agent, and three of modern introduction, depending for their results upon chemical treatment of varied character. Owing to the circumstance that mercury combines with almost equal celerity to form an amalgam with either gold or silver, it fortunately happens that when quicksilver is used the last named metal rapidly combines the two first, either present alone or together, into an amalgam, provided they are made to come into contact with the mercury in certain conditions. This is a circumstance never to be lost sight of in weighing the merits or disadvantages of amalgamation in comparison with the chemical methods of late introduction. Of the three chemical modes alluded to, two are totally unfitted for the extraction of gold at the same time that the silver is obtained by the different solvents; for gold is equally insoluble in hyposulphite of soda as hot water, and whatever may occur under very particular associations and conditions, this is quite certain, viz: that with ores containing gold, which have been desulphurized by means of heat, that valuable metal invariably exists in the metallic condition. The facts just stated will very much tend to prejudice the introduction of either method on this coast, particularly where the two precious metals are found in the same ore. Augustin's method, by leaching the artificially produced chloride of silver by means of a hot solution of common salt, possibly may in one respect possess some superiority over the hyposulphite of soda and hot water methods.

It has been proposed to obtain gold and silver at the same operation when employing Augustin's mode, by impregnating the hot salt solution with chlorine, which, it has been asserted, would have the effect of dissolving the gold present also. I have no knowledge how far any practical results have followed from the above suggestion. That this method would succeed to some extent I am satisfied, but its economic advantage is problematical, and is doubtful in the extreme if the gold should exist in a coarse condition, other objectionable features may also occur.

## AN EPISODE.

[The preceding, as well as the following unbracketed portions of the present paper, were written prior to the appearance of an article relating to Augustin's process which appeared in the MINING AND SCIENTIFIC PRESS on the 23d ultimo, being an extract in advance of the forthcoming work of G. Kustel. It was my intention at the time of writing the immediately preceding remarks, to have again returned to the subject when closing a summary of the adaptation and economy associated with the various modes for obtaining gold and silver from their ores. I then abstained from doing so, as I did not conceive myself to be sufficiently well informed as to whether or not the application of a joint saturated solution of chlorine and common salt, would effectively and at one operation leach out both the gold and silver present in the ore. With the exception of a case which will shortly be alluded to, I had not received any information prior to the appearance of the above notice by Mr. Kustel, that chlorine, in association with a solution of common salt, had ever been employed on a working scale for separating gold and silver from their ores at one and the same time. About three or four years ago, this mode was publicly proposed and underwent the usual round of the press, but I never heard that it had been acted upon on any considerable scale, though I suspected that something of the kind might have been done at St. Helens, Lancashire, England, about sixteen years ago. My suspicions are based upon the following

circumstances. As near as I can ascertain, sometime in the year 1859, Mr. J. A. Phillips delivered a lecture at the rooms of the Society of Arts, London, "On the Metallurgy of Lead." In consonance with the ordinary practice on such occasions at this institution, a discussion took place at the conclusion of the lecture. In the course of the closing remarks of the chairman of the meeting, (Robert Hume, Esq.) that gentleman observed, in common with other observations connected with the subject, that "The material formerly thrown away from that manufacture, (sulphuric acid) was now disposed of to another house, and being roasted with common salt, copper was obtained as a muriate, and precipitated with iron; chloride of silver was likewise obtained, which, being dissolved out by a strong brine, was subsequently precipitated. The silver cake was sent to the metropolis, where in place of only obtaining the usual price of 5s. (\$1½) it brought from 8s. to 10s. (\$2 to \$2½) per oz., on account of the gold it contained." Although not mentioned in the preceding paragraph, as incident to the process, that chlorine was employed in combination with brine, I am pretty well satisfied that such was the case, for the following reasons:

In my earliest communications in this State on the subject of gold and silver reduction, I mentioned the fact that, as early as February, 1849, I had patented in England, among other matters, some improvements for more economically obtaining gold and silver from certain refractory, or, as they are called in Washoe parlance, rebellious ores; which, at the same time, were described as consisting of a variety, locally called blue stone, containing about 40 per cent. zinc, in the form of blende, 8 to 10 per cent. iron as pyrites, 10 to 20 per cent. lead as galeua, 2 per cent. copper as sulphide, 8 to 12 ozs. of silver, and from \$2 to \$3 worth of gold to the ton; the balance, consisting chiefly of sulphur, with varying amounts of earthy matter, consisting of from 8 to 15 per cent. The motive that has induced me to give the above figures will soon appear.

The "material" alluded to above by the chairman of the Society of Arts, as having been thrown away prior to being treated for the extraction of copper, gold and silver, was the refuse of pyrites burned for the purpose of making sulphurous acid. At the time, or nearly up to the period under notice, the pyrites employed at St. Helens and the surrounding district was procured almost solely from Wicklow, Ireland. In this locality there are several pyrites mines, one only, however, containing gold, and that the solitary one which would continuously assay from 2 to 2½ per cent. of copper, but almost devoid of silver; the last not being present in more than from one to two pennyweights per ton. Before making any further remarks on the preceding figures, it will be as well to explain why they are inserted. I have, on former occasions, stated that my improved mode of obtaining gold and silver from ores was carried on at the Flint Lead Works, now occupied by the well known firm of Muspratt & Co. as a chemical manufactory. Being compelled to leave Flint when that firm purchased the above named works and removed their establishment from Newton Heath to that place, I resumed my professional business in London, and my partner (now deceased) established himself, by the aid of some friends, at St. Helens, with the object of utilizing the ore from Anglesea, as previously alluded to, and also the refuse pyrites above described. The same facilities for final reduction by means of lead, did not exist at St. Helens, which were easily procurable at Flint, and possibly caused my former partner to abandon that mode as unsuitable to his new position. Prior, however, to the rupture named, we had made some very extensive trials of various modes of concentrating, in the most economical manner, the various ores used, and also how far humid processes could be made profitably available, one of which was found highly effective, but could only be advantageously used where muriatic acid was an extensive waste product, as was the case with us at Flint.

From these considerations, I am induced to believe that either brine, impregnated with chlorine or containing some compound which would evolve that gas was employed in the process at St. Helens, and render it quite probable that it is from that establishment that this method first emanated. I have been led to this opinion since Mr. Kustel has stated that Von Paterna and Roeszner have adopted this method. As the statement made at the Society of Arts was evidently incorrect, so far as the omission of details are concerned, and as the

\* Respecting this ore more will be said on another occasion.

results obtainable by this mode ought to have differed very much from the value per ounce of the bullion reduced, if the above ores had been acted upon separately, I was led to believe that the chairman of the Society of Arts had been in some manner misled as to the *modus operandi* adopted at St. Helens. At all events, the information so derived did not, until corroborative proof was obtained, justify me in deeming that salt water and chlorine had ever been practised to any extent for the reduction of gold and silver ores, nor does it yet appear to me that such is the best manner of proceeding in the bulk of cases, though it may be the best in some instances.]

Of the eight methods which have been previously alluded to, no less than six involve the application of artificial heat for the purpose of expediting the process, which exceptions are those of Medina and Leca. These, when combined with the Freiberg barrel process, require also the assistance of furnace work, in order to facilitate the chlorination of the silver present in the ore, and thus expedite the reduction of that metal, as compared with the lengthened period required by the Patio process. It is not intended to dwell upon Barba's method at present, as it is not likely in futuro to be adopted at places where modern science has made any progress. I shall, however, again allude to it.

Dismissing from consideration for the present the earlier modes of amalgamation, and commencing a review, thus abbreviated, with the Freiberg barrel and terminating with the system introduced by Ziervogel, one incident will be found essential to each mode, viz: the absolute necessity that exists for the employment of a furnace.

It is the more requisite that this important circumstance should become well impressed upon the minds of all who feel interested in this matter, because science points out no other means so speedy and economical of setting gold and silver free from their accompanying gangues and sulphur as by the aid of furnaces; which, to be effective, require special construction and careful management of the temperature employed. It cannot, in fact, be too often iterated that future economical improvements will most probably, chiefly, if not wholly, depend upon a better mode of construction, and management of these preliminary appliances for the reduction of gold and silver ores. In connection with the preceding, it may also be briefly mentioned, that, with the exception of the mode introduced by Ziervogel, all the furnaces now employed in silver extraction are required to be erected for chlorinating purposes, which, unless specially constructed, and managed so as to avoid the loss by volatilization formerly alluded to, a very large proportion of the advantages derivable from an improved mode of amalgamation will become neutralized, probably constitute all the difference between a possible gain being converted into a certain loss.

**MINING IN THE STATE OF MAINE.**—The *Springfield Republican* states that a tunnel of 100 feet has been made in the new-discovered silver mine on the Bennett farm at Guilford, Maine, and ore has already been obtained that yields ninety-five ounces of pure silver to the ton; also copper and gold. It is believed by the miners that seventy-five feet more will bring them to the covered vein. More than thirty varieties of minerals are found in the Mount Mica mines at Paris, Oxford county; valuable beryls and one tourmaline, valued at \$1,100, were recently taken from them.

**LONG ISLAND LANDS.**—E. F. Peck, of Brooklyn, N. Y., says that the Long Island Plains, which are said to be the only prairies west of the Rocky Mountains, are quite valuable for all kinds of crops, and particularly suitable for fruit-growing. They seem worthy of a fair examination, but there seems two obstacles—the railroad is not much inclined to carry freight, nor do the proprietors of the land care about selling.

**VINEGAR.**—S. J. Woodman, of Chicago, Ill., says that a barrel or a cask of new sweet cider, buried so as to be well covered with fresh earth, will turn to sharp, clear, delicious vinegar in three or four weeks, as good as ever sought affinity with cabbage, pickles, or table sauce, and better than is possible to make by any other process.

A BERLIN paper states that the staff of workmen engaged at present in demolishing the fortifications of Luxemburg consists of three men and a boy. This is a new way of evading compliance with treaty stipulations.

## Scientific Miscellany.

### Preserving Meat and Fruit.

A new meat preserver has recently been presented to the French Academy by M. Pasteur. It is composed of alum, benzine and water—proportions not given. It is said to cover the animal substance to be preserved, with a sort of filtering substance, which excludes the decomposing animalcules, while it admits pure air and allows free evaporation. According to Pasteur the air, under such circumstances, has no tendency to produce decay of the animal fiber. This fact is in accordance with practical experience, though not with common impression. The butcher best keeps his meat by hanging it in a *current* of pure air, where it will keep much longer than in a still atmosphere. Most California miners, and most others, well know that if they hang their meat upon the limb of a tree, forty or fifty feet from the ground, in the pure, dry atmosphere of our California summer, it will keep perfectly sweet until it is actually cured by drying; while meat hung up in the shade of the same tree and near the ground, soon becomes tainted and decomposed.

It has long been known that fruit, carefully dipped in melted wax or paraffine, will keep for a great length of time. The thin film with which the fruit is thus covered acts precisely as the substance above described—it keeps out the organic agencies of decomposition, while the pure and uncontaminated air is allowed to pass gradually through the covering, inward, and at the same time the excess of moisture passes outward, as is seen by the eventual shriveling and drying up of the fruit.

Mr. W. R. Frink, late of this city, is now giving this principle a thorough test, to determine its practical value. He recently prepared a quantity of apples, peaches, pears and grapes in this way, and took them by sailing vessel to the Sandwich Islands. We have received word that they arrived in perfect condition. A portion of them will be kept for a considerable time, or until decomposition takes place. They can probably be kept, even in that tropical climate, the greater portion, if not through the entire season. We are anxious to note the result. We have here, also, abundant evidence that pure air has no tendency to promote decay.

Putting these last mentioned facts in connection with Pasteur's discovery, there is much probability that a practical plan for the preservation of fresh meats and fruits, will soon be developed, which will prove of inestimable importance to commerce. Either of the substances used may readily be removed, by merely dipping the articles into warm water. In the case of the latter (which is probably the best and cheapest agent, for the reason that it can be readily recovered and used again, for other purposes) there will be no taste whatever to the article preserved, even though a small portion should not be removed. Paraffine is both innocuous and tasteless.

HEAT developed by the electric current in wire is partly due to molecular action. This proposition has been, to some extent, demonstrated by M. E. Edlund, who finds the elongation of a wire traversed by a current is greater than its temperature, deduced from its electrical resistance, would develop. He therefore concludes that a molecular change of some sort has occurred by which the additional increment of heat has been produced.

THE power and persistency of the Bunsen battery, it is said, may be augmented by an arrangement devised by M. Zaliwski, which consists in employing two concentric porous vessels in place of one, filling the space between with sulphuric acid, putting nitric acid in the central one, and a solution of sal-ammoniac in the outer vessel containing the zinc.

PARIS OMNIBUSES are about to give way to the street car, or rails. These cars are to be both spacious and elegant. They are being built to carry fifty passengers each.

ANOTHER SOUND WONDER.—Prof. Tyndall is both ingenious and original in his researches into the phenomena of sound. The latest item which we have seen from him is one affording a most remarkable and pleasing illustration of the properties of sound in the extinguishing of a lighted candle by pure noise. The Professor places a lighted candle on a table at the end of a tube, supported on bracket holders, resting on the table. The end of the tube near the candle is small and pointed. The other end is large and open. By clapping two books together at the large end, Prof. Tyndall extinguishes the candle at the small end. "Pooh!" says an over-intelligent reader, "that is nothing. It is simply blowing out a candle through a pipe." No such thing, super-sagacious critic, as Prof. Tyndall proceeds to prove. He burns a piece of brown paper in the tube, filling it with smoke. Now, if the candle be put out by a puff, smoke will issue from the pointed end of the tube. Again Prof. Tyndall claps the books. Again the candle goes out; but no smoke comes out of the pointed end of the tube. Whatever has put out the candle has passed through the air and smoke in the tube. The light is extinguished by a pulse, not by a puff. The candle is put out by sound—noise.

THE COLORS OF SOAP BUBBLES.—A. C. Pope communicates to the *Scientific American* the results of some experiments recently made by him confirmatory of Sir David Brewster's new theory with regard to the origin of the colors of soap bubbles, which theory was given in full in our issue of the 16th ult. Mr. P. writes as follows: "My experiments demonstrate to all appearance, this theory. A preparation of oleate of soda, carefully prepared, was put into solution, in pure water and a given percentage of pure glycerine added. Bubbles blown from this solution were very brilliant, and the colors seemed to flow over the film from the part attached to the pipe, towards the lower part of the hubble, in irregular belts and streams, beginning with the most brilliant hues and tints and shadows, and gradually fading away as the menstruum ceased flowing, into deep blue, ending with the bursting of the bubble. The belts or streamers rippled like tiny waves on the surface of a pond, and from these ripples seemed to flash out the broken rays of light, changing constantly. The thicker the medium, the more brilliant the display."

THE bronzed appearance sometimes given to cast iron, is produced by dipping the castings into a solution of sulphate of copper. The copper is thus precipitated upon the surface of the iron, as in the experiment often made by miners, in testing a mineral for copper. Pulverize the mineral finely, and subject it to a bath of sulphuric acid; if copper be present, it will be taken up in solution, and if a piece of iron, as the bright blade of a knife, be inserted in the liquid, the copper will be deposited on the part submerged, literally *plating* it with copper.

PURE STEAM, in the condition in which it enters the cylinder of an engine, is as invisible as atmospheric air. It is also said that pure steam, or steam at a high temperature, will not burn or scald, until mixed with the atmosphere. *Query:* When the bulb of a thermometer is plunged into steam of a high pressure—or pure steam—the mercury indicates a high degree of heat, proportioned to the pressure of steam; Why will not such steam scald or "burn the hand?" Will it not?

PYROTECHNICS FOR THE SAVAGES.—The Magnesium Metal Company, of London, have received an order for the manufacture of 50 pounds weight of magnesium to be used for signaling purposes in the Abyssinian expedition. The metal will be burnt as a powder and mixed with resin and lycopodium, the light being produced at will by blowing, by means of a pair of bellows, a portion of the compound through a flame.

It has been discovered that if glue or gelatine be mixed with about one-quarter of its weight of glycerine, it loses its brittleness, and becomes useful for many purposes for which it is otherwise unfit, such as dressing leather, giving elasticity to porcelain, parchment, or enameled paper, and for book-binding.

## Mechanical.

### Conveying Steam Through Long Pipes.

In conveying steam to great distances from the boiler, the chief care to be taken is to have the conveying pipe just large enough to convey a sufficient quantity of steam to do the work required. In such a case the steam passes rapidly through the pipe, and does not have the opportunity to lose much of its heat by radiation. If, however, a pipe is used much larger than is necessary, the steam moves slowly along, exposed to a much larger surface, and loses so much of its elasticity, by super-saturation from the condensation which takes place, that when it reaches the engine cylinder, it scarcely retains 75 per cent. of the power with which it left the boiler. Regulating the size of the conducting pipe is of more consequence than protecting it with non-conducting substances. Of course, felling or otherwise protecting the pipe should not be neglected.

There is often much lack of judgment in arriving at the proper dimensions of a pipe for conveying steam to a given size of cylinder with given speed of piston. What may appear to most engineers as an extreme case of diminishing the size of the conveying pipe, is given by a correspondent of the *Scientific American* as follows:

We have a steam pump working in a mine slope 1,540 feet from the boilers. The steam cylinder is 14 inches diameter, three feet stroke, and we are carrying steam the whole distance in a 2-inch wrought pipe. We had some little trouble before the pipes were covered, but now experience difficulty in working the pump up to its full speed. We also have two steam pumps in mine slopes 800 feet from the boilers; the steam cylinders being twenty-five inches diameter and four feet stroke. The steam pipe for each pump is of cast iron, 3½ inches internal diameter. These pumps are working with perfect satisfaction, without any protection whatever to the pipes.

The same correspondent illustrates the advantages of employing small pipes as follows:

Suppose we take the pump with a 14-inch cylinder, at a piston speed of 100 feet per minute; if we should use a 14-inch pipe to carry the steam it would be over fifteen minutes from the time the steam left the boiler until it arrived at the cylinder, and there would be over 6,000 square feet of surface exposed to condense the steam. Now compare the above with a 2-inch pipe. In using a 2-inch pipe the steam would remain in the pipe about twenty seconds, and there would be but a little over 900 square feet of surface exposed to condensation.

The above is a pretty good demonstration of the utility of small pipes, and the question is one which is especially worth the attention of all who desire to use steam economically, whether at a greater or less distance from the boiler where it is generated.

BROKEN CAR WHEELS.—It is estimated that about 10,000 wheels are taken from under the cars and engines, on American railroads, every year. It is singular that with such a great wear and destruction of wheels no more accidents occur from that cause. Casualties are prevented by the custom followed of ringing every wheel with a hammer, as often as once a day, while running. Such examination generally detects the most of the fractures before they become dangerous. Only four accidents from this cause were reported last year. Nearly all the wheels break in the tread, where they are chilled. Most of the American car wheels are cast iron and chilled in the tread. It is held by most English engineers that such wheels are more liable to break than wrought iron—that, in fact, the very process of chilling often involves cracking or such a high degree of tension that cracking ensues at the first severe jar. American engineers, on the other hand, claim that on our roads, at least, cast iron wheels are more reliable than wrought, on account of the rapid wear of the latter.

STEEL CRANKS.—Ramshotom says his steel cranks out of plain flat slab.

## California Academy of Natural Sciences.

REGULAR MEETING.

MONDAY EVENING, Dec. 2, 1867.

President Whitney in the chair.

Forty-three members present.

Messrs. S. W. Holliday, Henry K. Goddard, Henry K. Moore and Ferdinand Lohr, were elected resident members.

Messrs. D. C. Humphry, P. B. Cornwall and Horace D. Dunn, of this city, and Prof. W. B. Rising, of Oakland, were proposed for membership.

Prof. Silliman read a very interesting paper on the new localities of Tellurium minerals in California, and on some mineralogical features of the Mother Vein. The paper was referred to the publication committee. We shall give an abstract of it in a future issue.

R. E. C. Stearns submitted a paper upon the shells collected by the Alaska expedition, under George Davidson Esq., of which Mr. Harford was naturalist.

Mr. Bolander submitted a paper from Prof. Lesquereux, on the California ferns, found up to the present time. Referred to committee of publication, without being read.

Prof. Whitney presented a paper on the condition and progress of the geological survey of California, an abstract of which we shall give next week.

**DISEASED PORK.**—Dr. Henry Gibbons exhibited a slice of pork, which had been sent him from Mariposa, and which was supposed to contain *trichina*. The Doctor said the animalcules were not *trichinae*, but *sticerus*; Dr. Barker thought they were *distoma*. In either case, they were not positively hurtful to the human system, especially where the meat was thoroughly cooked. Large numbers of these minute animals could be seen, (many of them by the naked eye) three or four upon every superficial inch of the muscle. They resemble small, light yellow bunches (soft) about the size of, and much resembling a small pea, rendered soft by being soaked in water. The pigs, from one of which this piece of pork was taken, were raised chiefly on distillery slops.

**IMPORTANT ERROR CORRECTED.**—Mr. Robert L. Harris had recently been engaged in running a level, for railroad purposes, from the bay to Sacramento. In the performance of this work, he was surprised to learn that the elevation of Sacramento above the high-tide level of the sea had been greatly overstated. The Pacific Railroad Company, in starting their survey, had based their initial point upon the reported level of the present levee, as being 56 feet above tide water, when it is in fact, only 21 feet, as proven by the survey by Mr. Harris. The low tule grounds, just below Sacramento, which have been heretofore considered 36 or 37 feet above the sea, have, in reality, an elevation of only one foot and a half! This fact, now established by Mr. Harris, is very important, and especially valuable to the State geological survey, and the various railroads throughout the State, all of which have heretofore accepted the commonly received reports of the elevation of Sacramento as substantially correct. This error has undoubtedly arisen from the imperfection of the instruments employed in determining the elevation of that initial point. It was mentioned, in this connection, that the level of Mount Davidson has been recently reported by taking the figures of the Central Pacific Railroad, near that locality, for a starting point, the result of which was given as the only correct report of the elevation of that mountain ever published, and showing, as was thought, that the California State Geological Survey had made a considerable error in their figures. This discrepancy is now accounted for, and the accuracy of the measurement of the geological survey fully established.

**BAD POLICY IN BURNING THE TULE.**—Dr. Gibbons remarked upon the bad policy of annually burning over the tules. He said that when burnt off, the deposit of ash was scarcely perceptible, nearly the entire substance being dissipated; but when this vegetation was snuffed to fall into natural decay, the annual increase in depth of soil would be very important, say one-fourth of an inch a year. At this figure, about two feet in a century would be gained. Such a yearly increase would soon effectually redeem all the tule land in the State, and render it highly valuable for cultivation. The Doctor thought if the burning could not be stopped in any other manner, legislative action should be invoked.

**OUR NORTHWESTERN PURCHASE.**—Mr. Goodale, who has recently returned from a visit to Alaska, exhibited to the Academy some very interesting Indian curiosities which he had collected there, consisting of

horn spoons and ladles, ornamented carving, caps, pouches, etc., all the work of the natives of that region. The Doctor thought but few people were aware of the magnitude and importance of our new acquisition. It consisted of an extent of country 600 by 540 miles, with two huge arms extending, the one southwesterly along the Pacific Coast 400 miles, to British Columbia; the other extending westerly into the Pacific Ocean about the same distance, and known as the Peninsula of Alaska. The number of islands included in this purchase, exceeds 400, which will measure from 100 acres of surface, upward. Of this number, thirteen are each as large or larger than the State of Rhode Island, and seven as large as Delaware.

Previous to this purchase, the difference of time between our most eastern and western boundaries was only three hours and forty-eight minutes, now the sun rose just eight hours and eight minutes sooner to the inhabitant of Calais, in Maine, than it did to the inhabitant of our most western island possession, in the Aleutian group, so that our possessions actually extend across more than one-third of the earth's diameter. Previous to this purchase we were not the possessors of a single active volcano. We now number nineteen, mostly on the islands above mentioned. We have also added glaciers to our other curiosities—a most extensive and magnificent one being located a short distance north of Sitka. The aborigines of our new possessions are of a far higher type, both physically and mentally, than any others on the continent. Their superiority consists in their greater foresight in the construction of better dwellings and furniture for the same, superiority of skill in carving, in the manufacture of implements, etc. Perhaps the most marked evidence of their superiority consists in the better treatment of their women, who are not compelled to do servile work, as is the case in nearly every or quite all the aborigines of this continent. They make no stone implements, probably from the fact that they have no use for them. Their food consists mainly of fish, which are generally made into a kind of soup, which is eaten from large horn spoons, made by themselves, from the horns of the mountain sheep, which are softened, straightened and worked into very convenient shapes, and often elaborately carved. These horns are sometimes three feet long. Spoons made from them were exhibited which would hold two quarts of liquid. Their soup is now made in iron and copper kettles, obtained from the Russian traders. It was formerly made in baskets, similar to those used by the California Indians, and boiled by throwing into the same heated stones.

**NEW INCORPORATIONS.**—Articles of incorporation have recently been filed in the County Clerk's office in this city as follows:

**CALIFORNIA REAL ESTATE ASSOCIATION.**—San Francisco. Nov. 29th. Capital stock, \$1,000,000; 50,000 shares of \$20 each. Trustees: M. O'Neil, T. J. Broderick, Wm. Monahan, E. B. Eaton, J. T. Galvin, James Brereton, A. J. Schrader, Robert Dixon and David Landers.

**CALIFORNIA TRUST CO.**—San Francisco. Dec. 5th. Capital stock, \$1,000,000; 10,000 shares of \$100 each. Trustees: H. H. Haight, John Curry, Wm. Blanding, Henry L. Davis, John H. Baird, Wm. H. Sharp, Henry Barroilhet, Jacob C. Johnson, Walter N. Hawley, Henry J. Booth, Donald McLennan, Charles J. Deering, Samuel Crim, Hiram Rosekrans, Chas. T. McDermott, Chas. M. Plum, Andrew J. Coghill, Frederick J. Castle, De Witt C. Thompson, Thos. B. Ludlum, Moses Rosenbaum.

**WILLOWS LAND ASSOCIATION.**—San Francisco. Dec. 5th. Capital stock, \$430,000; 860 shares of \$500 each. Trustees: H. L. Davis, Edward Bosqui, J. W. Brumagin, C. H. Harrison and Henry A. Cobb.

**ELECTION OF OFFICERS.**—CALIFORNIA AGRICULTURAL AND MANUFACTURING ASSOCIATION.—San Francisco. Dec. 4th. President, Hiram Rosekrans; Vice President, E. W. O'Neil; Treasurer, Henry F. Williams; Secretary, A. S. Gould.

**CALIFORNIA REAL ESTATE ASSOCIATION.**—San Francisco. Dec. 4th. President, Robert Dixon; Vice President, M. O'Neil; Secretary, William Monahan; Treasurer, James Brereton; Directors: A. J. Schrader, Dr. E. B. Eaton, T. J. Broderick, D. Landers and J. G. Golvin.

**LOCAL POLICE PROTECTIVE AND BENEVOLENT ASSOCIATION.**—San Francisco. Dec. 4th. President, Joseph Bogle; Vice President, James McQuirk; Secretary, Armand Barbier; Treasurer, James E. Wigmore; Relief Committee, George Birdsall, A. Cook, C. F. Callundan.

## New Patents and Inventions.

Under this heading we shall mention, from week to week on occasion may demand New and Important Inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent Issues which we deem of local interest to readers on this side of the continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

## RECENT INVENTIONS.

**IMPORTANT INVENTION.**—A strong pair of boots or shoes is something that every one wishes to get when he buys them, and many of the inventions for the manufacture of these articles are calculated only to make them hold together until the wearer has proven them by a few days' wear to be utterly worthless. As long as the leather itself is worthless, the manufacturer of boots and shoes cannot be held accountable for their early dissolution, but when the weather is good there is no excuse for a poorly made boot or shoe—one that will cast its sole at the first trip or turn of the ankle. Since the advent of the French screwed boots and shoes, we have found them to stand the wear and tear of our incontinent kicks and stumblings far better than the old pegged or sewed article. Mr. Nicholas Lumsden, of this city, has invented a machine for making the French screwed boot, which is simple, performs its work readily, and, better still, can be manufactured at a comparatively low price. Heretofore the price of the machines used for that purpose have sold at such high figures that none but a well-to-do shoemaker was able to purchase them, putting them entirely out of the reach of the journeyman; but Mr. Lumsden's machine overcomes this objection, and can be manufactured at such a figure as to enable every shoemaker, journeyman or cobbler to purchase one. We predict for Mr. Lumsden's invention a success, as it is an article greatly needed, and one that will recommend itself. A patent has been applied for through the agency of the MINING AND SCIENTIFIC PRESS.

Mr. Lumsden is also the inventor of a very ingenious machine for lasting and crimping boots, which entirely obviates the slow and laborious process as commonly practiced, and prevents the leather tearing at the corners when crimping on the board. One of these machines is in daily use by the inventor, and not only crimps, but lasts boots across the joints of the foot and at the shank. We should think it was an indispensable article in a bootmaker's establishment, especially where fine work on patent leather is much used, as it operates easily, by the simple turn of the screw, and performs that part of the mechanic's labor effectually, which, it not unfrequently occurs, requires all the strength and ingenuity a man can command to accomplish. A patent has been applied for through this office.

**USEFUL MINING INVENTION.**—The Nevada Gazette says: We examined yesterday at the hydraulic diggings of Marselus & Maltman, a very useful mining appliance, the invention of J. M. Allenwood, of Smartsville. It is called a "gooseneck," and is attached to the end of the pipe and used in place of the flexible hose. It is made of heavy sheet iron, having a cast iron swivel near the neck, so that it can be turned around, and near the end is a stout hose of eighteen inches in length, to raise or lower the stream at any desired elevation. This is all the hose used, the rest of the hydraulic appliances being iron pipe. They have three of these "goosenecks" in operation at the Manzanita diggings, and intend to get two or three more. Mr. Marselus informs us that it is not only more convenient, but more economical than the hose ordinarily used. The hose costs from \$20 to \$30, and has to be often replaced; the "gooseneck" costs \$50, and will never wear out. Miners who are about rigging up hydraulic works, as well as those replacing worn out hose, would do well to examine this new appliance. We understand it is used altogether in the hydraulic claims about Smartsville, but has not been introduced into this county to any extent.

A PATENT has been granted to a Maine mechanic for an invention for running shafting at right angles, or at any angle, without the use of gearing or helting. The idea is entirely novel, and works to a charm. A slide-bar is placed in the angle, and motion transferred by the action of a double crank on each shaft.

**STEAM PLOW.**—A young California machinist, a resident of Martinez, has invented a steam plow which will not only plow forty acres daily, but at the same time plant and harrow the field. The peculiarity of the machine is such that instead of plowing in furrows the soil is pulverized. If, as he is confident it will, the plow should perform

such wonderful work it will enhance in a remarkable degree the production of agricultural crops in this State. The inventor has applied for a patent for the same through the MINING AND SCIENTIFIC PRESS.

## PATENTS RECENTLY ISSUED.

70,603.—IMPROVED ORE-SEPARATOR AND CONCENTRATOR.—Thos. N. Paine and Samuel Stephens, Grass Valley, Cal.:

We claim, 1st, A pan, constructed with the copper-lined recess, p, at its top, to save the gold or amalgam, substantially as described.

2. The adjustable distributing-spouts, constructed with the posts d, e and f, and having the adjusting-screw g, the whole operating substantially as and for the purposes described.

3. The round arms E, with the separated brushes r, r, r, for agitating the surface of the pulp, operating substantially as described.

4. The ring rising automatically, and the rod b, together with the endless screw L, and the cone-pulleys K and K, when used for raising the ring H, substantially as described.

5. The movable feed-trough G, and the reservoir M, supported by the rollers k, k, and the plate l, operating as and for the purpose described.

6. The revolving belt n, with its brushes and the perforated plate, p, when used in the feed-trough G, as described.

7. The two-part shaft, constructed with a hollow, stationary slot shaft, C, and the hollow, movable slotted shaft D, when constructed with the bells and the grooves in their ends to prevent friction, operating substantially as and for the purpose herein described.

The object of this invention is to provide an improved separator and concentrator for saving the sulphurets contained in ores or minerals, by depriving them of the sand and debris, and placing them in a form sufficiently concentrated for treatment by the usual methods employed for extracting the bullion which they may contain. This machine was fully described in our issue of June 1st, 1867, to which we would refer.

70,670.—IMPROVEMENT IN WHEEL-HUB BOXES.—Elbridge G. Woodside, San Francisco, Cal.:

I claim, 1st, Surrounding the box A with an elastic packing B, substantially as described and for the purpose set forth.

2. I also claim, in combination with the packing B, the end packings, c and d, substantially as described and for the purposes set forth.

The object of this invention is to provide a wheel-hub and box, so constructed that when passing over rough places, the wheel will become relieved from sudden strain and jar by reason of the elasticity imparted to it by means of the elastic or rubber packing, which surrounds the box and ends of the hub.

**NEW YORK METAL MARKET.**—We gather the following from *Winterhoff's New York Metal Circular*, under date Nov. 4th, 1867:

**TIN**—is entirely nominal, without large transactions. Straits, 25c.; Banca, 26½c.; English, 23c., gold.

**COPPER**—with small demands for manufactures, had declined rapidly during the month under pressure to sell. Transactions mostly kept private. Baltimore, reported, 21¼@22c.; Detroit, 22¼@23c.; Portage Lake, 22¼@22½c. On day of date, the market had improved, increased demand at the above prices, without sellers. For December delivery, 1c. more added. Last sale of Minnesota was made at 25c.; fifty tons had been shipped to Hamburg. London market dull. Little changed in position from last summer. If market does not soon advance both in New York and London, the fact will be attributed to general depression of business.

**LEAD**—is quoted at 6½c., gold, for ordinary foreign; stock, 2,700 tons, against 2,000 in March, 1866.

**SPELTER**—nominally, 6½@6½c., gold, for Silesian.

**SPLendid SALOONS.**—Dr. J. C. Jessup, the eminent dentist, has taken a suit of rooms in Tucker's new building, northwest corner of Montgomery and Sutter streets. They will be fitted up without regard to cost, and will surely be the most elegantly furnished saloons in the city. Dr. J. C. Jessup is well known as one of our most skillful dentists on this coast.—*Helena Observer.*

Weekly Stock Circular.

Of Associated Brokers of the S. F. Stock and Exchange Board.

SAN FRANCISCO, SATURDAY MORNING, December 7, 1887.

City Stocks.

City shares command a little more attention, and the sales for the past week have been very considerable. California Steam Navigation Co. shows an advance, selling at \$67 1/2 per share.

The certificate of incorporation of the California Trust Company was filed in the County Clerk's office during the past week. Amount of capital stock \$1,000,000, in 10,000 shares of \$100 each.

IMPERIAL—has been quite active, advancing from \$170 to \$180, receding to \$150, and closing at \$167 1/2. The shipment of bullion in November amounted to \$63,363; in October to \$68,874.

From the City and County Treasurer's report, for the month of November, we condense the following statement:

Table with 2 columns: Item and Amount. Includes Cash on hand October 31, 1887, Receipts in November, Paid to the State Treasurer, etc.

The cash items are embraced in the following recapitulation:

Table with 2 columns: Fund Name and Amount. Lists various funds such as General Fund, School Fund, Police Fund, etc.

It will be seen from the foregoing, that a very large amount of gold is lying wholly idle in our city treasury. Box upon box of gold coin resting for want of use, when it might be employed to the advantage of the city's interest.

The following is a carefully compiled record of the daily aggregate sales in the open and regular sessions of the San Francisco Stock and Exchange Board during the month of November:

Table with 3 columns: Date, Regular Session, Open Session. Shows daily trading volumes for November.

Making a total of \$5,351,733. These figures compare as follows with the transactions of the same months in the three preceding years, viz: 1814, \$1,681,152; 1865, \$3,018,966; 1866, \$2,653,478.

Mining Share Market.

The mining share market has been characterized by a considerable degree of activity during the period under review, and the transactions embraced a more extended list.

SAVAGE—continues in the market to a large extent, receding from \$107 seller to \$103, improving to \$109, and closing at \$109 50.

Table with 2 columns: Date and Value per Ton. Shows price fluctuations for mining shares from November 30th to October 19th.

During the week ending November 30th, the north mine,

on the seventh station, yielded 379 tons of ore, and the north mine on the third station, 798 tons; in the previous week 888 tons were taken from the last named locality of this mine.

CROWN POINT—was moderately dealt in, gradually declining from \$60 to \$610, and closing yesterday at \$625. During the week ending November 30th, the north drift on the 700-foot level, 173 feet from the switch, has been carried south some six feet, and the breast, now seven feet wide, is said to open out well.

IMPERIAL—has been quite active, advancing from \$170 to \$180, receding to \$150, and closing at \$167 1/2. The shipment of bullion in November amounted to \$63,363; in October to \$68,874.

KENTUCK—has been well maintained during the period under review, selling at \$160 1/2, then at \$161, and closing at \$168. The bullion returns for November amount, so far as advised, foot up \$49,751.56.

CHOLLAR-PODSI—opened at \$131 1/2 to \$132 1/2, declined to \$121, then sold at \$124 50, and closed at \$128. The old mine yielded 1,800 tons of ore during the week ending November 29th, against 1,700 tons extracted the previous week.

GOLD HILL QUARTZ—shows a decline, sales of a few shares being reported at \$100 per share; at the close \$120 per share is asked. The bullion product of November amounted to \$122,250; in October, \$109,984.

AMADOR—commands \$210 per share. The bullion product for November reaches \$37,300; in October the yield amounted to \$38,555. The Superintendent reports that the north stopes now show a ledge twenty-five feet wide—nearly constituting the main and sixteen feet the boulder ledge—and the south stopes an average of twelve feet.

GOULD & CURRY—sold within a range of \$327 50 to \$310, closing at \$310. The annual meeting of the stockholders of this company will be held on Monday, the 18th inst.

HALE & NORCROSS—has been in moderate request, declining from \$840 to \$810, then selling at \$815, and closing at \$830. The total liabilities of this company on the 1st instant amounted to \$38,000, and not \$130,000, as stated by a "bear" correspondent of a leading newspaper of this city.

YELLOW JACKET—declined from \$24 to \$45, and closed at \$40. The Frey says that the station timbers at the 730-foot level have been placed, and two drifts started—one east, the other south, now in from eight to seventeen feet, in clay and porphyry. The winze near the Keutuck line continues in ore, but all hoisted of late will not more than pay for working.

The aggregate sales of Stocks, Legal Tender Notes, etc., at the regular sessions of the Board since Saturday last, amounted to \$1,015,638. The sales in the open sessions amounted to \$257,031, showing a combined aggregate to date during the past week of \$1,272,669.

AMERICAN IRON.—The advantage of the American Rodman gun, over all others, is said to be owing to the superiority of the iron from which it is manufactured. It is said that the British Admiralty has procured a quantity of the Pennsylvania iron, from which the Rodman guns are made, for the purpose of experimenting with it at their own foundries.

A WISCONSIN wine-maker was overtaken last fall by cold weather, and some 5,000 lbs. of his grapes frozen up in boxes. Wine made from these grapes was "one hundred per cent, better than that made from the same quality of grapes in the fall." Important if true.

MINING SHAREHOLDERS' DIRECTORY.

[Compiled for every issue, from advertisements in the MINING AND SCIENTIFIC PRESS and other San Francisco Journals.]

Compiling the Names of Companies, District or County of Location; Amount and date of Assessment; Date of Meeting; Day of Delinquent Sale; and Amount and Time of Payment of Dividends.

Table with columns: NAME, LOCATION, AMOUNT, and DAY. Lists various mining companies and their details.

\*Those marked with an asterisk (\*) are advertised in this journal.

Terms of Subscription.

Table with 2 columns: Subscription Type and Price. Lists various subscription rates.

The Circulation of the Press, already extensive, is rapidly increasing, and substantial advertisers can profit by widely disseminating information of their business amongst the most intelligent, influential and industrial classes of the Pacific States and Territories.

DEWEY & CO., Proprietors.

Patent Agency and Job Printing Office, 505 Clay street, San Francisco. [Jan 1, 1866.]

Important to Californians.

Many inventors have lately had their claims for Patents seriously (and in some cases fatally) delayed by the unqualification of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations. These discrepancies, although arising from the inexperience of honest agents, are none the less dangerous to applicants for patents, whose safest course is to trust their business with none but active and experienced solicitors.

## Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

## CALIFORNIA.

## Alpine County.

*Miner*, Nov. 23d: From the nature of the material to be penetrated, it is thought that the shaft on the Morning Star ledge may be sunk from three to five feet per week.

Wm. Suebbert, M. E., a graduate of the Freiberg School of Mines, has been made superintendent of the Merrimac mine.

The work of hauling ore to the Silver Creek mill has been resumed.

The Pittsburg Co. are pushing their main tunnel ahead as fast as possible, and at the same time sinking upon one or more of their lodes to determine their value.

The Tarshish mine of the Schenectady Co. is now turning out ore finely. The mine is not being worked for the ore, but to prospect and open it up; yet in the north drift, in the main tunnel, in the up shaft and in the down shaft, the workmen are taking out rock which is taken to the assorting floor, and fine pocket ore is continually encountered.

## Amador County.

*Ledger*, Nov. 30th: At the Coney & Bigelow mine, just now, all is hurry. All of the machinery for the new hoisting works is on the ground, the building up, and the mechanics are putting everything in its proper place. The shaft has been newly timbered from top to bottom, so that when they "start up" again everything will go along systematically. At the mill, a new boiler, with 47 flues, is being set, and eight additional stamps added.

Last Sunday, the Oneida Co. made their semi-monthly clean-up, and the return was, as usual, good. The amalgam was melted and run into a brick by Mr. Reichling, of this place, and when cleaned was worth \$11,800.

## Calaveras County.

*Chronicle*, Nov. 30th: Staples & Co., who have purchased the first extension of the "Old Rich Gulch" lead, are actively engaged in putting up machinery on their claim for a new mill. They expect to commence crushing by the first of January.

Alexander, Seavers & Co., who have been crushing rock taken from their claim on the same ledge for the past six months, are still receiving handsome dividends.

On Sunday last, we saw the bullion extracted from 42 tons of rock taken from the "Petticoat" lead at Railroad Flat. At \$16 per oz. it was worth \$2,537.

Quartz mining at West Point and Railroad Flat is daily becoming more successful. Barnes & Casner's last run of 105 tons averaged \$51.32 per ton. Austrian John ground 13½ tons that paid \$61 per ton. The Petticoat lead at Railroad Flat is improving, the last crushing of 40 tons paid \$60 per ton.

Thomason, Scott & Co. are at work on the first north extension of the Petticoat, and are taking out very fine rock; they will have a crushing of 100 tons out soon.

Gamble & Co. are drifting. Their dump is rapidly filling up with excellent ore. Quiddell & Co. are working a strong force at their mine on Austrian ridge. They have about 70 tons now at the mine, which experts pronounce good for \$30 or \$40 per ton.

San Andreas Register, Nov. 30th: C. V. McNair brought down from Washington Dist. some of the richest gold-bearing quartz we have ever seen. It is hard, blue quartz, and the gold is fine as flour, with occasional fine threads of gold. McNair says that the miners are opening some of the finest quartz veins in the State, and are beginning to take up water privileges for arastras.

## Inyo County.

Virginia Enterprise, Nov. 30th: Dr. Jas. Delevan, in Cerro Gordo, Inyo Co., Cal., writes as follows: I have been examining the mines since my arrival and find them more extensive and richer than I had anticipated. They consist of silver and lead mines, and the ores generally are of a character that require smelting, and the lead is just what is needed in smelting out the bullion. There is also a large amount of milling ore in some of the ledges. This is one of the richest mineral countries that I have ever seen, and is destined to give employment to a large population. There are a number of smelting furnaces here, put up and run by Mexicans, who are producing considerable bullion. I am in charge of the Cerro Gordo Co's affairs here. They have many good mines. I am about to erect a furnace for smelting ores, and a basso for refining the bullion. This company have ore that will produce an immense amount of bullion. I cannot say what the ore will produce per ton in these mines, but the

estimate of others who have been longer here is from \$150 to \$600 per ton.

## Kern County.

Havilah Courier, Nov. 23d: The New York and Clear Creek Co. are now crushing richer rock than ever before. The old firm of Marsh & Kennedy, whose business has been suspended for some weeks, will resume work on Monday.

Nov. 30th: The property of the Mammoth Co. was sold on the 18th inst. at sheriff's sale to Geo. D. Roberts. Work on the mine will be resumed.

We have seen some rock of unusual richness taken from three different claims in Sageland Dist.: the St. John, Dockweiler & Co's and Hurd's. Some of the rock yields as high as \$500 to the ton. There is an abundance of rich rock in this district, and the prospects generally are encouraging.

The Delphi mine, in the upper end of this town, is turning out better rock than ever before found.

The New York and Clear Creek Co. have recently struck a large new vein of surpassing richness.

Rand's mine is also doing better, and will commence crushing again.

## Mariposa County.

Gazette, Nov. 30th: Parties have leased the ditch conveying water from Stockton Creek to the small ravines emptying into the Mariposa Creek, and are making arrangements for sluicing the hillside below the Mariposa Co's vein.

Mail, Nov. 30th: Adam Volk, proprietor of the hotel at Colorado, while working in his claim, recently, picked a nugget weighing 29½ oz.

## Mono County.

Esmeralda Union, Nov. 23d: Castle Peak, in Mono Co., Cal., has been attracting considerable attention of late, and several parties interested there have sold parts of their interests for very fair figures. The main ledge is being well prospected. Ore from this ledge has been worked by mill process both here and in Virginia, giving to the owners satisfactory returns. Interested parties have told us that these mines will be worked vigorously while the weather is favorable.

## Nevada County.

Gazette, Nov. 28th: Marselus & Maltman, owners of the Menzanita diggings, commenced the work of hydraulicizing a week or two ago, having everything prepared as soon as they could procure water. At present, they take water of the ditch company, and are using about 450 inches; but they have a ditch of their own which will supply nearly all they require when the ground becomes thoroughly saturated.

Nov. 30th: We were shown yesterday, by S. N. Strahan, superintendent of the Chalk Bluff Blue Gravel Co., some fine gold specimens taken from the company's claims near the Cascades. One nugget, picked up on the bed-rock, near the rim of the basin, weighs about 2½ ozs. Several other lumps, which were also picked up on the bed-rock, or washed out in pans, weighing from a quarter to half an ounce.

Dec. 3d: The New York Hill Co. took out of their mine, during the month of November, 540 loads of quartz. This has been crushed at the Massachusetts Hill mill, but not yet cleaned-up. The yield of the mine for the month of October was 500 loads of quartz, producing some \$20,000. The rock crushed in November, it is believed, will yield at about the same rate as that worked in October. The company have lately purchased the mill of the Cambridge Co. on Howard Hill, and let a contract to Seth Mansav to remove it to New York Hill, and put it in running order.

Grass Valley National, Nov. 26th: A massive 9-flue boiler, 21 ft. in length and 5 in diameter, passed through town this morning on its way to the North Star mine, French Lead.

Nov. 30th: Work will be commenced on the gravel claims recently discovered by Messrs. Hamilton and Harrison as soon as water can be brought in. Their gravel prospects well.

Work has been resumed upon the Inkerman ledge by Ambrose Powning & Co. This ledge is situated on Weimar Hill, near French Lead. It is being worked on shares at present, and the company working are down 65 ft. on the ledge, and the prospect at that depth is flattering.

Quite a number of specimens are being taken from all parts of the Dromedary mine. The company have out 100 loads, which will average \$50 to the ton.

The Gold Hill mill is engaged in crushing float quartz. A lot from Woodpecker Ravine has been crushed, and is now being cleaned-up, and the mill is now at work on another lot from some other section.

Dec. 2d: A large amount of gold is expected to be taken out of Gold Run this season. The ditches are at present affording

a large supply of water, and the miners are pitching in merrily.

Transcript, Nov. 27th: A quartz ledge, which shows fine croppings, was discovered a few days since near the Starr mine in Eureka township, by Michels & Co. The parties are now engaged in opening the ledge for the purpose of testing its value.

Nov. 28th: A contract has been given to parties to take out a large quantity of rock from the upper level of the Union mine, owned by the New York Co.

The Birchville mine at Eureka is a paying institution. It has been opened from the surface and worked continuously for several months, every ton of rock yielding good pay. A fine mill has been erected upon the claim, and all this has been accomplished without a dollar of assessments.

Nov. 30th: A new 30-horse engine is being built at the Nevada Foundry for the Star Spangled Banner mine, which is to be used entirely for hoisting. The fine 30-horse engine now used for pumping and hoisting will be used only to raise water from the mine. The Banner is now worked constantly and keeps two mills running day and night, paying its owners good returns.

Dec. 1st: The sulphurets from the McLellan mine assay \$1,400 per ton.

Grass Valley Union, Nov. 26th: Some time since the company working on Jones Bar, South Yuba River, struck a bed of cement exceedingly rich in gold. They took out about eight tons of the cement before the rise in the river drove them out. There is supposed to be a larger quantity left in the claim, and probably running out of the river into the hill. The cement is very hard, and, to use our informant's expressive words, "is lousy with heavy river gold."

EXCELSIOR. — Virginia Enterprise, Nov. 28th: The Enterprise Co., Meadow Lake, during the summer have built a new mill, 40 by 80 ft., and now have 5 stamps in operation, with room to add 15 more as soon as the emergencies require it. They have also put up a new shaft-house, 30 by 40 ft., over their new shaft, which is now 100 ft. deep and shows excellent ore all the way down. The ledge is 20 ft. thick, and shows free gold in almost every part. The company have erected a furnace 30 ft. in height, and capable of roasting 30 tons of ore at one time.

## Placer County.

Dutch Flat Enquirer, Nov. 30th: The Iowa Hill correspondent says: The miners are all busily engaged. The Morning Star Co. are running their mill day and night, and are also running a new tunnel lower than the old one. They expect to strike through during the winter, in which event they will put up a new mill in the spring. The Lebanon Co., on Prospect Hill, started their mill on Saturday last, and will run it day and night as long as the water holds out, and as soon as it fails they intend to procure an engine and run with steam. The old North Star has commenced operation by running a sluice-tunnel. Belthe & Brother have opened a new hydraulic claim on Prospect Hill which promises remunerative returns. Hornem & Co., on Wisconsin Hill, are washing with two pipes day and night. Wm. Miller of the Jamison claim at this place is at work and will make the old diggings "talk" shortly.

Auburn Stars and Stripes, Nov. 28th: The recent ratifol rains have filled the water ditches and made the hearts of the waiting miners glad.

At Gold Run, the Yuba and Bradley ditches are furnishing fine supplies.

H. Robards, who it was reported had struck a fissure that yielded 813 ozs. in 36 hours, writes to the Stars and Stripes, stating that he only got 428 ozs. He thinks his luck was good enough without stretching it.

## Plumas County.

Quincy National, Nov. 23d: The mines at Cariboo are still paying well. Messrs. Vanderpool, Reed & Co. have commenced two drifts on the pay streak in their claim, and large returns may be looked for. Joseph Hickman's claim, which has paid well during the season, still meets with the approbation of its owner. Thos. P. W. Orton's claim is paying good wages.

The claims of Barker, McNulty & Co. on Mill Creek are paying good wages, yielding from \$5 to \$11 per day to the hand.

The Bamboo river claim is still paying well.

On Saturday last Messrs. Hallsted & Sparks, cleaned up their mill in Granite Basin, after crushing 100 tons of quartz, and took out \$2,000—an average of about \$20 per ton.

Oroville Record, Nov. 30th: Owing to the fact that Messrs. Halstead & Sparks' ledge is not yet prepared for mining, they have leased their mill to the owners of the Jenny ledge for the winter. The latter company will immediately set the mill at

work on their ledge. A new shaft is to be sunk on the Helstead and Sparks ledge.

Since the recent rains, the hydraulic claims of Cowley & Gavel, Gard and Orr, and William McClelland, at La Porte, have resumed piling.

Good quartz rock has been struck on the Pennsylvania ledge, in Indian Valley, Plumas county, and it is being hauled to the mill to be crushed.

## Sierra County.

Downville Messenger, Nov. 30th: The owners of the Chips quartz ledge are busily at work putting up an 8-stamp mill, which they intend to have in running order in a few weeks. Their rock pays remarkably well.

The result of the recent run of the Phoenix mill, above Sierra City, was \$600 per ton from the upper or smaller ledge, and \$25 per ton from the lower. The company has placed everything in order for the winter, and will do no more work until spring.

## Siidyoun County.

Yreka Union, Nov. 23d: A company is engaged in running a tunnel into one of the banks of Rancheria Creek near Cottonwood. The bed of the gulch above the point where the tunnel is being run has been very rich, and it is the opinion of the gentlemen interested in the tunnel that the lead has left the present bed of the gulch and is to be found back in the bank or hill. At the edge of the bank there is high bedrock, but it is thought there is a channel further back, which was the original bed of the stream. The tunnel is being run with the expectation of finding this channel, which if found, it is supposed, will be rich in gold, as the bed of the stream above that point has been.

## Tuolumne County.

Stockton Gazette, Nov. 30th: A gravel cement mill at Jeffersonville, Tuolumne county, crushes 35 tons of ordinary gravel in 12 hours, and 80 tons in 24 hours, if the gravel is not very hard.

## ARIZONA.

Miner, Nov. 16th: Mr. McCrackin, who has just arrived from Lynx Creek, says that before he left the creek, he and others cleaned up the proceeds of 20 tons of rock from the Deadwood, Pointer, Tie-Tie and other lodes, and that all of the rock crushed averaged \$50 to the ton.

Work upon the recently discovered Chance silver lode is progressing finely. It contains plenty of free gold and native silver. It is the intention of the owners of the mine to work their rock in arastras as soon as water comes. The silver amalgamates as freely as the purest gold, and they look for no difficulty in seeing it according to the old Mexican style.

A party of Coloradans who have prospected a portion of Lynx Creek, and found pay dirt, intend to work the claims and give them a fair trial.

The parties at work on the Dividend continue to find excellent pay rock as they progress with the shaft which they are sinking upon the lode.

The Wickenburg correspondent says that everything about the Vulture mine and mill is as usual prosperous.

## BRITISH COLUMBIA.

Cariboo Sentinel, Oct. 14th: A company of Chinamen who have been engaged for some time past in working over old ground on the Grier and Point claims, below Richfield, struck a small crevice, week before last, from which they obtained \$10,000.

A recent assay of silver ore from the Harrison Lake lode, gave a return of seven ozs. of silver and a few pennyweights of gold to the ton.

Oct. 21st: The frost during the past week was so severe that it put a complete stop to all open air mining.

The Draper and Sharp Co. on Cunningham Creek, who own the Kentucky claim, have commenced cleaning their ground sluice, and are making from \$60 to \$70 per day to the hand.

Oct. 28th: The mining season is about closed. A few companies are still at work cleaning up, although the frosty weather is a great drawback to their operations. The publication of the Sentinel will be suspended until next spring.

## COLORADO.

Times, Nov. 12th: Oil has been found on Cherry Creek. A large number of claims have been staked off and recorded.

The Live Yankee furnace seems to have proven a failure. There were furnished to them two tons of ore from the celebrated Young America lode, assaying \$133 per ton. It was hauled in such a wretched way that the bullion obtained was only .230 fine. One bar, weighing 131¼ ozs. troy, was refined by cupellation, and yielded 26 ozs. of fine silver. A little more than 50 per cent. of the silver was obtained. Next a lot of rich ore from the White lode was tried. It

was manipulated in the same way as the Young America ore. It was found desirable to melt the bullion down, together with a small bar, obtained by Garrott, Martine & Co., from another lot of White ore; said bar marked 23, weighed 103.75 ozs., coin value, \$112, fineness .835; yet even this desirable increase and the expenditure of a large amount of horn and niter would not produce silver of a greater fineness than .600. A gold retort obtained at the same establishment was reported to have contained 2 1/2 per cent. of gold.

Assays made by Mr. Johnson of ore from the Gen. Marion lode shows an average yield of \$154.35 per ton.

A mass of silver weighing 130 lbs. and valued at \$2,300 coin, was sent East on Thursday by the proprietors of the Equator lode. This was obtained from a portion of six tons of ore now being treated at the Georgetown Smelting Works, and is the largest button that has been sent out of this country.

Garrott, Martine & Co. are now engaged in reducing 12 tons of Equator.

The exports for the two weeks ending Nov. 12th are as follows: G. T. Clark & Co., \$20,000; Warren Hnssey & Co., \$11,000; Rocky Mountain National Bank, \$20,000.

Georgetown *Miner*, Nov. 14th: Some very large, beautiful ores from the celebrated Baker lode, West Argentine, are on exhibition in front of the Brown Co's office.

The Wm. Penn lode, on Democrat mountain, is showing up finely, under the active development now being pushed forward by its owners.

A solid vein of the richest argentiferous galena in the known world, has been struck in the Terrible lode, recently, at the depth of 46 ft. The crevice is 61 in. in width, between solid, smooth walls. The ore vein consists of five in. of argentiferous galena, fine cubes, somewhat of a fractured steel appearance, that assays \$3,195.75 per ton; even in. of galena and zinc blende, that assays over \$200 per ton. The balance of the crevice is gangue, filled with seams of zinc blende and galena.

Prof. Burlingame made an assay of ore from the Rainbow lode, Brown Mountain, last week. The yield was \$530 silver per ton.

An assay of ore from the Flora McLain lode on Brown Mountain, made by Mr. Foster, gave \$1,777.75 silver per ton.

More recent assays of ore from the Terrible lode, gave \$3,572.72 per ton.

Central City *Register*, Nov. 19th: An assay of ore, taken from the bottom of the shaft gave \$3,185.75 per ton.

Six tons of ore from the Equator lode, worked at the Georgetown Smelting Works, assayed after crushing, \$800 per ton.

Five hundred lbs. of ore has been taken from the Anglo-Saxon lode at a cost of \$55, contains silver at the rate of \$3,000 per ton. One hundred tons assorted, yielded 167 ozs. per ton.

The following is the result of assays lately made at Georgetown: Ore from the Baxter yielded \$437.77 per ton, from the Edwena, \$396.98 per ton, and from the Lilly \$754.26 per ton.

A hutton of silver worth \$2,300 was yesterday taken from Equator ore by the Georgetown Smelting Works.

**IDAHO.**

Boise *World*, Nov. 16th: The clean up at Classen's 25-stamp Pioneer mill last Saturday, gave a product of 2,300 ozs. of amalgam. The mill is now at work again, working every stamp, and gangs of men are incessantly employed, day and night, both in the tunnel and the mill. The ore is developing richer and richer as the ledge is penetrated.

The Granite Creek correspondent writes: There is not much mining going on here now, but a few of the creek and bar claims are still being worked with generally very profitable results. John Noon & Co, cleaned up 400 ozs. of amalgam from their bar claim, after a run of three weeks.

Owyhee *Avalanche*, Nov. 23d: The ledge in the Golden Chariot mine has been struck. We were shown some ore, with coarse particles of gold diffused throughout, that was taken from the ledge in the tunnel. It is not known how wide the ledge is, as the workmen have not got through it yet.

The Iowa mill has worked several tons of ore from the Rising Star mine which paid from \$80 to \$100 per ton. The Iowa and Idaho Co. have now a sufficient quantity of ore on the dump of the Rising Star to turn out \$100,000.

**NEVADA.**

Esmeralda. The once familiar face of the Esmeralda Union, greeted us this week after an absence of some five months. From it we learn that a great change has taken place in mining operations, and it adds, from every

camp in the country we hear the most cheering news.

The same paper says: Thirty-three men are employed on the Silver Circle ledge. Three shafts have been sunk; one 125 ft., one 90 ft., and one 60 ft., from all of which good ore has been taken. As high as \$60 per ton has been taken from the mine by mill process.

The Salt Basin & Silver Peak Co. at Silver Peak, are driving ahead as though they meant business. They are making ready to erect a fine mill.

At Pine Grove there is one mill in operation and another in course of construction, besides several arastras. The ore they are working is paying well. At Washington one mill has been completed, and the machinery for another is on the way. Ore from this camp has been worked at Dall's mill and yielded well.

Dr. Dozier has made several successful tests of ore at Hot Springs. He is now completing some large furnaces, which are all efficient will leave the precious metals.

**Humboldt.**

Unionville *Register*, Nov. 23d: The excitement over the developments in Fall & Co's mine is unbounded. The tunnel in the mine is now in about 70 ft. The ledge is considerably decomposed, and is well charged from wall to wall with ore that will pay from \$100 to \$1,000 per ton, mill process. These figures are not conjectural and founded on fact, but are the result of actual workings in the mill, which is kept constantly running day and night on this ore. The company intend to erect a 20-stamp mill at an early day.

Preparations are being made to resume work on the mine of the Rochester Co. at an early day.

Mr. Negus passed through town, a few days ago, with several hundred pounds of silver bullion from the Goleonda mine, the result of his first run. This mine has proved to be better in every respect than the most sanguine expected. The supply of ore is apparently inexhaustible, yielding upon an average \$60 to the ton. The entire cost of mining and milling does not exceed \$10 per ton.

Several cords of silver bricks are corded up at the Oreana furnaces, and still the superintendent is satisfied with the capacity of his works, is making extensive additions thereto, among which are four new calcining furnaces.

Immense quantities of exceedingly rich gold ore are now on the dump at the Monroe mine, and still it comes from the lower level by the tons. Arrangements have been made to supply Holt's mill with ore. Mr. Holt has a faculty of turning out from \$300 to \$500 per ton from this ore.

Fall & Co. shipped this week 1,200 ozs. fine bullion.

Negotiations are being made to supply the French mill at Winnemucca, with ore from the Cumberland mine.

**Pahranaagat.**

Silver Bend *Reporter*, Nov. 23d: The Hiko correspondent writes: There is considerable excitement here about gold mines discovered within one mile of town. I saw some of the quartz; had free gold pointed out to me; saw room enough for it, but not having my microscopic glasses at hand, couldn't see the gold. However, a meeting of miners is called to form a new district. The Indiana ledge is looking better than ever, and owners of silver mines here are feeling gay. Ostram's mill is progressing slowly.

The editor adds: Since the above was written we have seen a gentleman from there and learn that several ledges of quartz, showing gold, have been found 2 1/2 miles east of Hiko, and that considerable excitement prevailed. Our informant panned out a little dirt—debris from these lodes—amounting to several handfuls only, and obtained about a dozen flakes of gold.

**Reese River.**

Reveille, Nov. 26th: Very fine ore is now produced by the Chase mine, and that a lot of it will be shortly sent to mill for reduction. Pieces were picked from the ore dump which showed both ruby and metallic silver, the latter occurring in threads and flakes. The present developments of the mine are represented to be very encouraging.

Nov. 25th: Persons who have arrived here within the last few days from the Newark Dist., speak in flattering terms of its prospects. The fine 20-stamp mill of the Centenary Co., with its complement of roasting furnaces, was opened on the 18th inst., with every indication of complete success. There was a plentiful supply of good ore waiting reduction. The Chihuahua ledge—the principal mine of the company in the district—is among the most promising in Lander county. In the deepest excavations the vein is broad, compact, and carry-

ing a large proportion of valuable ore; and our informant believes it can be soon put in a condition to furnish a full supply of ore for the mill.

Nov. 27th: We were shown yesterday by Capt. Monroe samples from the outcropping of two ledges in the district of Hot Creek, both handsome and rich looking, and their fine indications entitle them to development. One of the ledges is named the New Cumberland, and the other, of the width of four ft., is named the Vinton.

There may be seen at the First National Bank a fine sample of ore from Leon & Co's claim on the El Dorado ledge, Silver Bend Dist. It was selected from a lot of ore thrown out by a blast. The handsome ore might readily be taken for a specimen from the Highbridge or Transylvania, even by a person familiar with the appearance and quality of their mineral.

On Monday 2,200 lbs. of ore from the Garrison claim, a new discovery in the Cortez Dist., were carried to the California mill for reduction, where it gave a yield of \$812 per ton.

Nov. 29th: Yesterday 3,000 ozs. of crude bullion were brought into the city from Coover's mill at Bunker Hill Dist.

Silver Bend *Reporter*, Nov. 23d: The Murphy mine, in Ophir Cañon, belonging to the Twin River Co., will this month produce bullion of the value of \$75,000 coin.

Two hundred and forty-seven pounds of crude bullion were brought here last Monday from the O'd Dominion Co's mill, and forwarded to Austin.

The incline in the El Dorado South is progressing finely and the ledge constantly increasing in richness. Selected specimens of the ore assay up into the thousands—one giving the handsome sum of \$2,863.32 to the ton. Upon the locations made south of this—recent discoveries—work is continued energetically and has been attended with the most encouraging results.

Nine tons of ore were recently taken to Hot Creek for reduction from a newly discovered deposit near the Crescent, in Reville Dist. A ton and a half being selected was crushed and gave a pulp assay of a little over \$900 per ton, while the remaining 7 1/2 tons yielded over \$300 per ton.

The new 20-stamp mill of the Centenary Co. started up on the 18th inst., with a plentiful supply of good ore ready for reduction. Roasting furnaces have been erected and there is nothing now in the way of success.

**Washoe.**

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

Virginia *Enterprise*, Nov. 28th: The new hoisting of the Empire and Imperial Cos. will start up next Saturday. The works are among the largest and most complete in the State.

Dec. 1st: Mr. Jones—late candidate for Lieutenant Governor on the Union ticket in California—has been appointed Superintendent of the Kentek mine, in Gold Hill. Also, James Rule, Esq., foreman of the Yellow Jacket north mine, has been appointed Superintendent of the Hale & Norcross mine in Virginia. This company (the Hale & Norcross) is about raising its capital stock from \$400,000, divided into 800 shares of \$500 each, to \$1,200,000, to be divided into 800 shares of \$1,500. Work will be commenced in the north shaft of the Yellow Jacket to-morrow.

Trespass, Nov. 30th: The Bowers mill, in Crown Point Ravine, Gold Hill, under the energetic supervision of L. S. Bowers, Esq., is being thoroughly repaired. The engine, pans, agitators, vats, and other machinery, are being overhauled and put in working shape, and next week the mill will commence crushing ore from the Bowers mine, several hundred tons having accumulated, while more is being mined daily.

**UTAH.**

Salt Lake *Vedette*, Nov. 22d: Messrs. Eddy and Staples who have just returned from the Sweetwater mines near South Pass, state that the weather had been pleasant, new placer claims discovered, and the miners generally well in high spirits. A saw mill has been erected on Mill Creek, and is turning out an abundance of good timber for building and mining purposes.

Reese River *Reveille*, Nov. 29th: Maj. P. A. Gallagher lately arrived from the Sweetwater mines, speaks highly of the ledges, several of which develop finely. He brought a number of specimens of the quartz exhibiting free gold, and one large piece, which may be seen at the office of Wells, Fargo & Co. has its faces well studded with the yellow metal. Maj. Gallagher thinks that 300 men will winter in the district.

**OREGON.**

Alhany *State Journal*, Nov. 16th: An assay of ore from the rich gold bearing ledge

of quartz, recently discovered by Moses and Miller has been made, and paid \$2.13 1/2 per lb. The lodge has been opened in two places, one tunnel run in about 100 ft. below where they first opened, and shows full as rich quartz as at the top. They will commence with an arastra at first, and as the lodge opens they will make such improvements as are necessary. Some of the selected rock assayed as high as \$6,000 per ton.

## Canvassing Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. Jan. 11, 1867.

Mr. C. T. Roney is our duly authorized agent for Sacramento County. Nov. 23, 1867.

Dr. L. G. Yates is our duly authorized traveling agent. July 6, 1867.

Mr. A. B. Butler is a duly authorized traveling agent for this paper. July 15, 1867.

Mr. H. C. Northrop, is our duly authorized agent for Oregon, Washington, Idaho, and Montana. Aug. 17.

## San Francisco:

Saturday Morning, Dec. 7, 1867.

## Notices to Correspondents.

QUID NUNC.—The saying to which you refer, viz: "That he was the wisest amongst the rich, and the richest amongst the wise," was applied to Henry Cavendish, the discoverer of the compound character of water, and the first philosopher "who weighed the world," also the most distinguished of English chemists. Although the grandson of two dukes, viz: Devonshire and Kent, notwithstanding this high descent, being the son of a younger son, his earlier years were passed in what has not inappropriately been termed respectable penury. From this circumstance it is supposed that, combined with settled, studious habits, arose that exercise of personal economy which was his great characteristic, and which, doubtless, was the immediate cause of such a great accumulation of wealth of which he was found to be possessed at the time of his death, amounting, probably, to not less than ten millions of dollars, if his real estates are included in the estimate. With the exception of some comparatively trifling legacies, this large sum was bequeathed to the younger brother of the then duke of Devonshire, who, however, was the father of the present duke. Perhaps no descendant of a feudal aristocracy possesses so thoroughly noble a descent as the marquis of Hartington, the heir of Chatsworth, combining as he does the blood of Boyle, the great promoter of pneumatic science, with that of Cavendish, and by his mother remotely allied to Howard, the inventor of the vacuum pan. Such a genealogy any one may be proud of. It is gratifying to know that the Cavendishes have invariably been found among the foremost advocates for liberal institutions.

MANIPULATOR, Reese River.—Lead readily amalgamates with mercury in the cold, perhaps more readily than silver; this is chiefly due to its porosity. A bar of lead, immersed for ten days in cold mercury, becomes thoroughly penetrated by the latter metal. A bar of lead, bent in the form of a siphon, and dipping into mercury by the shorter end, if formed of unhammered lead, will be found in a short time with drops of mercury at the longer or lower end, and will permit the mercury to flow out until the vessel is emptied. If the bar is made of non-hammered lead, the first drops of mercury will appear in about twenty-four hours; but, if the lead has been hammered, it does not appear until ten days have elapsed. The mercury does not pass along the bar, but through its pores, thus evidencing the porous character of the metal.

BOHEMIAN.—The singular decrepitating salt to which you allude, is obtained from the rock-salt mines of Wieliczka. The phenomena is attributed to the fact, that in this peculiar rock-salt certain gases are retained in a compressed state within the crystals of the salt, which, when in the act of dissolving, the gases are set free, thus occasioning slight reports. By H. Rose these gases are said to be a mixture of hydrogen, carbonic acid and marsh gas.

THE GATTLING GUN.—The Berlin journals state that the Prussian government has determined on trying a certain number of revolver cannons on Gatling's system. Several of these guns have recently been sent to the plains to be used against the Indians. This American invention attracted considerable attention at the Paris Exposition.

## A New Quicksilver Furnace.

While at the Miners' Foundry a few days since, our attention was called to a new furnace for extracting quicksilver from its ores. It is made entirely of boiler iron, and to the casual observer would be taken for a steam boiler, simply. It in fact combines the two. While roasting the ores of mercury, it is at the same time making steam, which may be used either for propelling machinery or for creating its own draught, to which latter purpose the steam produced by the furnace just constructed at the Miners' Foundry, is to be exclusively applied. This furnace is the invention of Mr. J. C. Coult, of this city. The one herein described, is the first one constructed and will be erected upon one of the mines recently opened near the head of Pope's Valley, Napa county, about forty miles northerly from Napa City.

The furnace is divided into five compartments, consisting of two fire chambers, which are on the outside of the furnace, two ore chambers adjoining, and one vapor chamber in the center. The partitions dividing the compartments are all water-lined, having tubes passing through the linings, of sufficient size and number to admit freely the heat of the fire to pass through the cross section of the ore, in the two ore chambers; the heat and vapor of mercury passing together into the center or vapor chamber, and from thence down into a pipe, through which it is carried off into the condensing chambers erected for that purpose. These chambers are all surrounded by water, that is constantly being changed to keep the condensing chamber cool, and have forty feet of cooling or condensing to one of heating or fire surface. The furnace is also provided with large steam room capacity, sufficient to make ample steam to produce the required draught for the furnaces. Mr. Coult has obtained two patents, covering the mechanical principles involved in the construction of his furnace.

FOUNDRY WORK.—In addition to the quicksilver furnace, elsewhere described, as just having been built at the Miners' Foundry, that establishment has just completed two large boilers for the new Oakland ferry boat, now on the ways at the further end of Long Bridge. These boilers are each 28 feet long by 8 feet in diameter of shell. There are four furnaces and twenty-two flues to each boiler; the flues varying from 9 to 13 inches in diameter. These boilers are made of the best charcoal branded iron, five-sixteenths thick, and double riveted on bottom of shell and throughout one-third of circumference. They are constructed to sit side by side, one smoke-stack serving for both. They are now being hauled on trucks to the foot of Fourth street, from whence they will be taken in lighters to where the boat is being constructed.

We also noticed, in course of construction, a large number of sections of a lift-pump, which, we were informed, was intended for the Imperial and Empire united shaft. Four hundred and fifty feet of pipe are being constructed, with which the company intend to lengthen their pumps, several of which are in operation, and pumping water at the present time, from a depth of about 1,000 feet. The irons for a heavy balance bob are also being made for the same parties, at the Miners' foundry.

PROF. E. W. BLAKE, JR., has been invited to fill the chair of Physics in Columbia College, New York, to supply the place of Prof. Rood, who is prevented by illness from discharging his duties, and is at present recruiting in Europe. We understand that after the return of Prof. R., Prof. Blake will permanently occupy a Chair in Cornell University, at Ithaca, New York. He is a native of New Haven. After taking his degree at Yale College, and the Sheffield Scientific School, he completed his studies at Heidelberg, Germany.

## Meeting of the Legislature.

Both branches of the Legislature assembled at the Capitol at 12 M. on Monday last. Every Senator except Knox (deceased) was in his place, and all the newly elected Senators were duly sworn in. Of the House, all but four were present and were sworn in.

The Senate was organized on Tuesday by the election of L. D. Misner as President *pro tem*: John White, Secretary; W. F. Heustis, Assistant Secretary; F. S. Lardner, Sergeant at Arms; C. E. Barnes, Minute Clerk; John E. Dent, Journal Clerk; W. H. Frink, Engrossing Clerk; W. L. Hawkins, Enrolling Clerk; and A. W. Perley and D. S. Marston, Copying Clerks.

The Assembly was organized on Wednesday as follows: C. T. Ryland, Speaker; John A. Eagan, Chief Clerk; J. K. Luttrell, Sergeant-at-Arms; Wm. S. Byrne, Assistant Clerk; N. Benedict, Minute Clerk; D. F. Beveridge, Enrolling Clerk; R. M. Clarken, Engrossing Clerk, and H. G. Sieberts, Journal Clerk.

The inaugural ceremonies took place on Thursday, with more than usual ceremony. Both Houses adjourned over on Friday, to Monday next. The inauguration hall, on Thursday evening, is said to have been a grand affair, and everything was done which could add to the enjoyment of the guests.

We append the names of the members of both Houses, with the districts which they represent:

## SENATE.

BRADY, E. L.—Placer.  
BELDEN, DAVID—Nevada.  
BANNING, PHINEAS—Los Angeles.  
BEACH, HORACE—Yuba and Sutter.  
CONN, WILLIAM A.—San Diego and San Bernardino.

WILLET, STEPHEN—El Dorado.  
WARFIELD, J. B.—Sonoma.  
WAND, THOMAS N.—San Francisco.

THE OAKLAND COTTON FACTORY has proved a pecuniary success, as is sufficiently shown by the enlargement of the capital stock, and the erection of new and additional buildings, to accommodate the increase of machinery and business. The company has recently made arrangements to go extensively into the manufacture of grain bags, which they say they can make and sell cheaper than the imported article, on which our farmers have heretofore chiefly depended. It requires about \$100,000 per annum to pay for the sacks required for the California grain crop. The chief part of this purchase has hitherto been made in England. The stoppage of this outgo of coin will prove a most important item to the State.

EVERY'S PATENT PUMP.—This new description of pump, which digs its own wells, and which may be put down to water in an almost incredibly short space of time, and set to work at once, appears to be meeting with universal favor all over the world. It has lately been introduced into England and France, where it was looked upon as a most important and valuable invention. If we are not mistaken, a well can be dug, 50 feet of tubing put down, and the pump furnished and put in working order for \$50. We shall soon give an illustrated description of the manner in which this work is so effectually and so cheaply done. This pump is rapidly coming into use in this city and vicinity. It is adapted to almost any locality, where it is not necessary to penetrate into hard, rocky strata for water. S. P. Roberts is agent for California and Nevada.

THE GOLDEN CITY.—A new paper appeared upon our desk this week, bearing the name of *The Golden City*. The paper is published and edited by Foad, Dismore & Co., and presents a fine appearance. It is designed for a first class family paper, and judging from the first issue, we would pronounce it all that it claims.

MINERALS IN SOUTH AFRICA.—Very important copper discoveries are reported in South Africa, within seven miles of the mouth of a navigable river and nearly on the sea level. A township has been laid off and quite a mining excitement has grown up. Rumors of the discovery of silver and other important minerals are also current.

CONTINENTAL Life Insurance Company, 302 Montgomery street, corner of Pine.

**THE LATE EXPLOSION AT THE HOOSAC TUNNEL.**—Much mystery is attached, according to the papers, to the late explosion in the Hoosac Tunnel; and an Eastern correspondent has sent us a slip from the Springfield Republican, giving a full account of the disaster, and asking an explanation of the mystery. To us there does not appear any mystery at all. From the slip sent, and from other accounts at hand, we learn that the explosion occurred on the 19th of October, at the month of the shaft which is being sunk about midway on the line of the tunnel, for ventilation and also to allow workmen to drift each way from the shaft, in order to hasten the completion of this great work. The shaft is now down about 700 feet, with 350 feet further to go to reach the level of the tunnel. Around the mouth of this shaft a series of buildings has been constructed, for office, machine shops, saw-mill for getting out timber, etc.

Previous to the advent of the present contractors, several iron tanks had been placed in a portion of this structure for the purpose of holding naphtha, from which gas was manufactured for lighting the workmen in the shaft. The gas was abandoned by the present contractors, and kerosene substituted. The day before the explosion took place, however, the tanks had again been filled and the gas once more introduced. One account before us says that at the time of the explosion a lighted candle was burning about 20 feet distant from the tanks. Other accounts make no mention of that or any similar fact.

According to the report in the Springfield Republican, just prior to the explosion, R. Peet, the clerk, who has been at the shaft for three years, formerly in the employ of the State and latterly retained by the contractors, and who is thoroughly conversant with the gas and its working, went with another man to examine the meter. When the door of the casing was opened, the gasoline, for some unknown reason, flashed into an explosion, and the two men barely had time to escape.

We are not advised whether the tanks were perfectly closed or not. Whatever might have been the intent, however, there is no doubt but there was an escape of vapor from somewhere, and that vapor was drifted in a current of air into contact with the flame of the candle above referred to, or some other flame; hence the explosion. Such explosions have been quite frequent in this city, proceeding both from common illuminating gas and from the gases thrown off from coal oil on storage.

Naphtha, or the vapor of naphtha, in a close vessel, and apart from the heat requisite for its inflammation, will never explode spontaneously. Woolen, cotton, or any other equally inflammable substance, when saturated with animal or vegetable oils, will often absorb oxygen with sufficient rapidity to produce spontaneous combustion; but such substances, saturated with coal oil or its products, will not explode spontaneously; from the fact that the latter oil is a preservative of such substances, utterly precluding their absorption of oxygen. The oils and gases themselves will unite rapidly with oxygen, and burn violently when they are raised to a proper degree of heat—yet they will never generate sufficient heat to produce combustion.

**THE IRREPRESSIBLE CONFLICT** is the name of a toy recently invented by a young lady of San Francisco, and is a very amusing representation of a "rough and tumble" fight, between a Caucasian and genuine African. Messrs. Jellinck & Hardenburgh, scroll sawyers, California Street, have the contract for making them. Traver Bros., 32 Merchants' Exchange, are the agents for their sale. Several toys have made fortunes for the inventors. As this is in every respect a home production, and a favorite among the young folks, it will doubtless be well patronized. A patent has been applied for through this office.

**ELLERY'S PATENT INDIA-RUBBER PAINT.**—We would call attention to the advertisement of the paint sold by Eppes & E. H. R. Ellery, under the above title. This paint is coming into very general use on this coast as a marine paint and for public buildings, dwellings, etc. It is said to be both cheaper and better than the ordinary lead paint. Abundant reference of its use is given in the advertisement above referred to.

"You may talk to me of Baltimore and Philadelphia and New York, and their railroads and the trade of the Atlantic—let me tell you that the Pacific Coast is already beginning to revolutionize the world."—Speech of Hon. Wm. H. Secard to the people of Annapolis, Maryland, June, 1861.

**ADDRESS**

To the Permanent Citizens of the Pacific States and Territories.

**Citizens.**—We enjoy the finest country that the sun shines on, the most varied and fertile soil, the most extensive seaboard, and the greatest breadth of land having the richest metallic deposits possessed by any one nation of the earth, a land affording all the most varied material for manufactures, wool, hides, cotton, silk, metals, coal, fiber, gums, wool, and, above all, abundance of every kind of food.

We are only a million of people, and yet have more land and sea than Russia with sixty millions—more land than France and Germany, with their hundred millions of people. In the face of these vast resources, there are towns crumbling to decay, men seeking without finding employment. Something wrong here, or this would not be happening. Let us consider.

The instructed mind of the population is mostly devoted to political office-seeking. Their ambition is misdirected. The rising youth is trained to idleness. This mode of thinking and training must be reversed if we would hold this magnificent country against the incoming barbarian.

We must teach our youth the glories of manufactures, of commerce, of industry. We must nourish every effort, however rude, at manufacturing what we require. By devoting some of our capital and our young people to manufactures and general industries we shall soon become busy, get rich, bring more and more people into the country, create new wants, build up new factories and new villages around them; cultivate more land, build more ships, generate more commerce, and thereby create profitable employment for all who want work.

Now, fellow citizens, some money capital is required to help on this industrial movement. Where shall we get it? There is a considerable fund which we may divert from its present bed and channel, viz: the Insurance Fund.

Consider. The people of the Pacific States pay two hundred thousand dollars a month to the Insurance Companies for assuring them against losses from fire and shipwreck.

There are some fifteen of these Insurance offices in this city, each fishing for its share of this large fund. Each office pays a heavy rent, a half dozen officers and clerks, besides printing and advertising; the lowest cost is a thousand dollars a month on each office, and with some it is double that. There are too many persons employed in the business; too much dozing over newspapers; too much red tape and circumlocution; too high salaries and too little work. Think of two hundred thousand dollars a month! two millions and a half a year!! paid to those sleepy gentlemen for what little they do. This must be reformed. Three or four Insurance offices are quite enough for the million of scattered inhabitants of the Pacific States. A dozen of them may be abolished with great benefit to the community; some one or two have already withdrawn. This change would liberate some fifty men of education, whose business capacity would be of much greater service to the community in other branches of industry, such as manufactures, agriculture, commerce, the fisheries, the forests and the mines. This change would also divert a million or two of dollars to other and more useful industries, whereby a thousand fold more of national capital and employment would be generated than by the present drowsy system.

The managers of the Builders' Insurance propose, with the co-operation of the people, that this vast monthly stream of wealth shall be arrested and diverted to the aid of home manufactures, to effect a great reform and remove from the people's shoulders the expense of supporting a small army of insurance clerks and agents. The Builders' Insurance Company has passed through its first year (the most trying) with singular success. It has gathered a hundred thousand dollars, paid promptly all its losses, and established a business income of fully twenty thousand dollars a month! This has been done while we were yet but an experiment, and enjoying the confidence of only a portion of the public. We now appeal to the entire people. We ask them to send their insurance business to us on the following conditions, and soon we shall have an income of ONE HUNDRED THOUSAND DOLLARS A MONTH, and here is what we shall do with the money.

First, we calculate, from our past experience, that we shall lose by fire and marine disasters half our monthly income (on our first year's experience our losses were but one-third of our income).

Suppose, then, that our income shall be worked up to one hundred thousand dollars a month, and suppose that we shall pay out losses to the extent of fifty thousand dollars a month, we shall still have fifty thousand dollars a month to bank up, (or half a million a year.) We propose to make two parts of this sum—one part (a quarter of a million a year) to be invested in City Bonds, to protect the assured, and one part (about a quarter of a million a year) we propose to convert into a

**MANUFACTURERS' LOAN FUND,**

Which shall be lent exclusively to manufacturers on mortgage of their premises and machinery, at as low rate of interest and on as long time as is generally current on real estate.

By the aid of this fund the budding industries of the Pacific States may be nourished into active life; more and varied employments can be originated for the people; immigration may be welcomed and not feared; the farmer will have got a market at his own door for the produce of his land; the manufacturer will find a lively home demand from the farmer for the products of his machines.

All this, good people, can be achieved, by your own votes at your own freights, without the aid of Congress or the Legis-

lature—it is simply to vote that your insurance shall go to the Builders, by which vote you shall enable us to plant factories all over the country. You shall fill the rivers and harbors with busy ships; you shall send out upon the distant waves fishing expeditions that will bring back wealth to your cities; you shall form a nursery of seamen around your own shores—the ova of a future commerce and a protective navy; you will create the hum of busy workmen in every desirable locality on the Pacific Coast; you will bring from neglected fields produce of the utmost value; all of which will most certainly multiply a thousand fold the wealth of the country in which your lot is cast, making a worthy home for yourself and a future country for your offspring.

People of the Pacific States and Territories! We pledge ourselves to you to effect, with your co-operation, some of those things. We have kept all our pledges so far, and have uttered nothing that was not true. Already have we helped to move the shuttle and the loom, which others, with more means, have passed by and neglected. Already have we helped to build and rig ships in our own dock-yards, and sent them over the wide waves in search of riches for the city. Already have we given many liberal bounties and donations to the deserving institutions of the city. Give your vote to the Builders, and we shall share its profits with every useful charity and every honest industry, and help along every enterprise that promises benefit to the people.

We call for the yeas and nays.

THOMAS MOONEY, President.

EDWARD MACCANN,

WM. B. COOKE,

W. O. WEIR,

J. D. CONNELL,

J. W. MCCORMICK,

C. A. JENKE,

HERMAN SCHWARZE,

J. W. MCKENZIE,

H. V. HERBERT, Secretary.

13v15-1am4t

**MARKET STREET HOMESTEAD ASSOCIATION.**—J. S. LUTY, Secretary. Office, 305 Montgomery street, corner of Pine, San Francisco. 2v15

**BUSINESS NOTICE.**—Mr. A. T. Dewey, of this journal, contemplates a visit of several months in the Atlantic States, a portion of which time he will spend in Washington, New York and Boston. Any of our Eastern friends who wish to communicate with him, for business or other purposes, will address their letters to "Westfield, Mass."

**JACOB SHAW, Pioneer Photographer,** 612 Clay street, north side, four doors above Montgomery, (late 315 Montgomery street,) takes all kinds of Photographs in the best style of the Art. He would invite special attention to the new "Cabinet Photographs," which he is taking to perfection. 10v14t

**SECRETARYSHIP FOR MINING COMPANIES.**—A gentleman of education, ability and experience, is desirous of procuring a position as Secretary, or Assistant Secretary, in some good Mining Company. Has many unexceptionable references. Address "SECRETARY," at this office. 6v15t

**CO-OPERATIVE UNION STORE.**—This is becoming one of the most useful institutions in the city, and the Mechanic and Laboring Man fully appreciate it. They are now enabled to buy their Groceries and Provisions twenty per cent. cheaper than ever before, and the very best articles in market. The store is located at 115 Sutter street, Lick House Block. 2v15t

**Save Your Teeth.**—Do not have them extracted without first consulting a good Dentist. The loss is irreparable, and, in many instances, unnecessary. DR. BEERS, corner of Pine and Kearny streets, makes a specialty of filling the fangs of dead Teeth, and building up broken crowns with PURE GOLD—thus restoring them to their original usefulness and beauty.

Call and examine the work. Finest quality of artificial work also manufactured. 16v14-4f

**Perry Davis' Vegetable Pain Killer.**

The Pain Killer, so justly celebrated, was introduced to the public many years ago, and now enjoys a popularity unequalled by any other medicine. For the cure of diphtheria, dysentery, cholera morbus, rheumatism, coughs and colds, scalds, burns, etc., it is without an equal. Sold by all the principal druggists.—Cleveland (Ohio) Platibdealer.

**PERRY DAVIS' VEGETABLE PAIN KILLER** possesses virtues which not alone removes pain instantly, but regulates the stomach, gives strength, tone and vigor to the system. It is one of those medicines which is worth more than gold.

Prices, 25 cents, 50 cents, and \$1 per bottle. Sold by all Druggists, Grocers and Medicine Dealers everywhere. novim

**TO SOLICITORS OF PATENTS.**

**HASELTINE, LAKE & CO.,**

**Foundry for Sale.**

A One-half Interest in the **UNION IRON WORKS,** SACRAMENTO, Owned by William R. Williams, is offered for sale on the most favorable terms.

**A Good Bargain**

May be bad, as the proprietor is going home to Europe. It is seldom that so good an opportunity is offered for a sure and permanent investment. The business of the establishment is exceedingly flourishing, as can be shown. The Shop is of brick, new and well built. The lot is 85 feet front by 163 feet in depth, in a good location for this business, on Front street, between N and O streets. Inquire at the office of the Foundry, or address **WILLIAM R. WILLIAMS,** Sacramento, Cal. 26v13t9-16

**Oakland College School.**

The PATRONS of this Institution have the choice of several distinct Departments. The SENIOR CLASSICAL is designed as preparatory to the College of California.

The SENIOR ENGLISH affords a complete course of instruction in the English branches, in Theoretical and Practical Business, Science and Art.

The JUNIOR is especially qualified to meet the wants of young boys, for whom separate apartments and Teachers are provided.

Throughout all the various departments, great attention is given to the study of the Modern Languages.

For further information, or Catalogues, address, **I. H. BRAYTON, Principal.** OAKLAND, California. 5v15n9p.

**ROOT'S**

**Patent Force Blast Blower.**

Adapted for Smelting, Foundry, Mining and Steamships.

Requires 50 per cent less power than any Blower now in use. For further particulars, address **KEEP, BLAKE & CO.,** Stockton; or Wm. T. Garrett, corner Mission and Fremont streets, San Francisco. 5v15t13p

**ELECTROTYPE CUTS, ENGRAVINGS, Etc.**—Our Job Printing Office is abundantly supplied with elegant engravings, or name-plates, and other embellishments to suit the various branches of industry in this State.

**Rates of Postage on Printed Matter to Europe and Asia.**

The Post Office Department has made arrangements by which a number of European and Asiatic countries, hitherto beyond the reach of our mail communication except by letter, are brought within the range of delivery of all, or nearly all, United States mail matter. It is a singular fact, unknown probably to most persons who have not occasion to learn it by unpleasant experience, that there was a considerable region in the civilized world where an American traveler might not receive a newspaper directly from home.

Under the arrangement now completed, prepayment of postage (sometimes at high rates), is made necessary in all cases. The following official statement gives a full list of the countries—with some of which there has been regular communication—that are now included in the delivery by way of Hamburg and Bremen:

- NEWSPAPERS—MARKED AS FOLLOWS:**  
Bremen, by Bremen mail—2 cents each.  
Hamburg, by Hamburg mail—2 cents each.  
Prussia, Austria and German States, by Bremen and Hamburg mail—3 cents each.  
Lunenburg, by Bremen mail—3 cents each.  
Lunenburg, by Hamburg mail—3 cents each and 1 cent per 1/2 ounce.  
Schleswig-Holstein and Denmark, by Bremen or Hamburg mail—3 cents each and 1 cent per 1/2 ounce.  
Sweden, by Bremen or Hamburg—3 cents each, and 1/2 cent per 1/2 ounce.  
Norway, by Bremen or Hamburg—3 cents each, and 3/4 cent per 1/2 ounce.  
Holland, by Bremen or Hamburg—3 cents each, and 1 cent per 1/2 ounce.  
Russia, by Bremen or Hamburg—3 cents each, and 1 cent per 1/2 ounce.  
Switzerland, by Bremen or Hamburg—4 cents each.  
Italy, by Bremen or Hamburg—5 cents each.  
Turkey, by Bremen or Hamburg—3 cents each, and 5/8 cent per 1/2 ounce.  
Greece, by Bremen or Hamburg—3 cents each, and 5/8 cent per 1/2 ounce.  
Gibraltar, Spain and Portugal, by Bremen or Hamburg—3 cents each, and 2/3 cent per 1/2 ounce.  
Austria, India and China, by Bremen or Hamburg mail via Marseilles—3 cents each, and 9 cents per 1/2 ounce.  
Austria, India and China, by Bremen and Hamburg mails, via Trieste—3 cents each, and 2 cents per 1/2 ounce.

- PERIODICALS, ETC.**  
Bremen, by Bremen mail—1 cent per ounce.  
Hamburg, by Hamburg mail—1 cent per ounce.  
Prussia, Austria and German States, by Bremen or Hamburg—1/2 cent per ounce.  
Lunenburg, by Bremen mail—1/2 cent per ounce.  
Lunenburg, by Hamburg mail—1/2 cent per ounce, and 1/2 cent per 1/2 ounce.  
Schleswig-Holstein and Denmark, by Bremen or Hamburg—1/2 cent per ounce and 1/2 cent per 1/2 ounce.  
Sweden, by Bremen or Hamburg—1/2 cent per ounce, and 2 cents per 1/2 ounce.  
Norway, by Bremen or Hamburg—1/2 cent per ounce, and 4 cents per 1/2 ounce.  
Holland, by Bremen or Hamburg—1/2 cent per ounce, and 1/2 cent per 1/2 ounce.  
Russia, by Bremen or Hamburg—1/2 cent per ounce, and 1/2 cent per 1/2 ounce.  
Switzerland, by Bremen or Hamburg—1/2 cent per ounce, and 1 cent per 1/2 ounce.  
Italy, by Bremen or Hamburg—1/2 cent per ounce, and 2 cents per 1/2 ounce.  
Turkey, by Bremen or Hamburg—1/2 cent per ounce, and 5/8 cent per 1/2 ounce.  
Greece, by Bremen or Hamburg—1/2 cent per ounce, and 5/8 cent per 1/2 ounce.  
Gibraltar, Spain and Portugal, by Bremen or Hamburg—1/2 cent per ounce, and 2/3 cent per 1/2 ounce.  
Austria, India and China, by Bremen or Hamburg mail, by way of Marseilles—1/2 cent per ounce, and 9 cents per 1/2 ounce.  
Austria, India and China, by Bremen or Hamburg mail, by way of Trieste—1/2 cent per ounce, and 2 cents per 1/2 ounce.

**To REMOVE STUMPS.**—Mr. John Barnes, of Baltimore, removed a troublesome stump from near his house in the following manner: Last fall, with an inch augur, he bored a hole in the center of a stump, ten inches deep, and into it put about half a pound of the oil of vitriol, and corked the hole up tight. This spring the whole stump and roots, extending all through its ramifications, were so rotten they were easily eradicated. If true, the above would be a cheap method of removing stumps. The sulphuric acid could be bought for about five cents a pound.

**THE NORWAY RAT,** which has so effectively exterminated the native rats and mice in this State, has done the same thing in New Zealand. The English housefly is also extirpating the native blue-bottle fly of that island. The latter, being found much more troublesome than the former, is carried to distant localities, carefully caged in boxes, to destroy the native fly.

**HORSE STEAKS.**—It is said that two new shops have been recently opened in Paris for the sale of horse meat. These establishments in the "Emporium of Fashion" are now said to number eighteen.

**J. WRIGHT.** H. KRONE.  
**CALIFORNIA**  
**TOOL AND FILE FACTORY.**  
Blacksmith and Machine Shop.  
No. 17 Fremont street, between Market and Mission, S. F.

**STEAM ENGINES,**  
Flour and Sawmills, and MACHINERY of all descriptions made and repaired at shortest notice.  
Particular attention paid to repairing Reynold's Cut-off 5v10-9

All About Sending Money by Mail.

RATES OF COMMISSION.—The following are the rates charged (in currency) for transmitting money to any part of the United States:

On Orders not exceeding \$20.....10 cents.  
Over \$20 and not exceeding \$50.....25 cents.  
No fractions of cents to be introduced in an Order. United States Treasury Notes, or National Bank Notes only received or paid.  
To send over \$50, additional Orders must be obtained.  
Post offices where Money Orders may be obtained will furnish blanks as follows, which the applicants will fill out:  
No. .... Amount .... Date, 189 .....

MONEY ORDER.

Required for the sum of \$.... Payable at ....., State of ....., Payable to ....., Residing at ....., State of ....., sent by ....., Resulting at ....., State of .....

ENTRUSTED TO REGISTER: ....., Postmaster.  
The applicant must, in all cases, write his own given name and surname in full, and when the given name of the payee is known, it should be so stated; otherwise initials may be used. The given name of married women must be stated, and not those of their husbands. For example: Mrs. Mary Brown must not be described as Mrs. William Brown.  
Names of parties and places, and the sums, to be written in the plainest possible manner.  
As there are several places of the same name in the United States, applicants must be careful to indicate which of them they mean; and the Postmaster will satisfy himself, before writing out the order, that the place indicated is the one intended.

The North Devon Herald (Eng.) states that a poor man was sent to jail from near Barnstable for 21 days because he allowed two of his children to go on the parish. On inquiry, it was stated that his wages were only four shillings, or \$1 a week, and out of this he was paying 70 cents for keeping one child. He was doing the best he could.

THE GOLDEN ERA.

Founded in 1852, it is the oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent.

THE GOLDEN ERA

Is the most universally popular of all the Weekly Journals. It presents forty-eight columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected matter. It is a welcome guest in Cottage and Cabin; the favorite at the fireside in city and country; the most useful, agreeable and altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe and elsewhere. Every household in the mountains and valleys, the cities, towns and mining camps of California, and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor. Inspired with the genius of the age, it is progressive, and aims not so much at distinction as a newspaper, as at honorable success in its capacity of a great Moralizing and Improving Influence. Exercising a positive power for good, and wielding a permanent influence, many able and eminent writers choose its columns as a means of communicating with the public. No effort will be spared to make it a thoroughly California newspaper, and worthy of the support of all classes of our citizens.

Assays of Gold, Silver, Copper and Lead Ores.

SPECIAL ATTENTION GIVEN TO THE ANALYSIS OF Ores, Minerals, Clays, Waters, and General Commercial Products of all kinds. Tests of Gold, Silver, Copper and Lead Ores, by Smelting, in quantities of fifty pounds to five, ten or fifty tons. Consignments of ores solicited. Refining of Bullion at usual rates.

Our Patent Agency. THE PATENT AGENCY OF THE MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the Press, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

MINING AND SCIENTIFIC PRESS.—This valuable journal has closed its fourteenth volume and entered upon its fifteenth. It is a publication that should have a wide circulation among our mining and mechanical population. It publishes, in addition to the most complete summary of mining news, a vast amount of information on the application of science to mining and the mechanic arts. It contains notices and descriptions of all new mining processes, and all machines intended to facilitate the extraction of the precious metal from ore and rock with which it is blended. It also chronicles all new inventions, and, in most instances, contains drawings to illustrate them. To miners and mechanics it is a paper of incalculable value, and should be in the hands of all who desire to keep themselves posted in the progress being made in these departments.—Tribune Union. Postage.—The postage on the MINING AND SCIENTIFIC PRESS to any portion of the United States is twenty cents per annum, or five cents per quarter, payable in advance at the Post Office delivering the paper. Postage free in the city and county. Foreign postage (with few exceptions) two cents per copy, prepaid. To Bremen and the German States (marked via Bremen and Hamburg line), three cents per copy, prepaid. Single copies to any address in the United States, two cents.

Professional Cards.

SHERMAN DAY, Mining Engineer, No. 114 Montgomery Block, Saa Francisco. Will examine, survey and report upon mines, and consult and advise concerning investments in mining property, or of the machinery management and expenditures of mines.

When you want Printing done cheap, send to TRUESDELL, DEWEY & CO., Who do all kinds of Printing at the lowest rates.

FOUNDRIES

Will save money by having their printing done by TRUESDELL, DEWEY & CO., Who have put prices down to the lowest rates.

TRUESDELL, DEWEY & CO.

BOOK AND JOB PRINTERS, MINING & SCIENTIFIC PRESS OFFICE 505 CLAY STREET, SAN FRANCISCO.

AN INSTRUCTIVE BOOK!

Prof. LAYRES'

ELEMENTS OF COMPOSITION, BELLES-LETTRES AND ORATORY

For Scholars, Teachers, Lawyers all Professional Persons, and those of Common Education, who would improve the Eloquence and Effectiveness of their Composition and Manners of Address.

Price, postage paid, \$1.10

This is a new publication, and in style and treatment of this important subject, is original, simple, plain and comprehensive. The author, Prof. LAYRES (a meritorious Teacher of good standing in California, and a sound thinker and reasoner), in his preface says: "The method pursued by the Author in developing the subject of Composition, is both the synthetical and analytical. The former is necessary to teach the theory, the latter the practice of the art; and as these are both indispensable to the scholar, so are also the two methods, as the sequel will show."

The Work has lately been approved and authorized by the State Board of Education for use in the Public Schools. To further illustrate the varied and popular endorsement the book has so rapidly received, we quote the following

RECOMMENDATIONS:

It is simple, concise, and well arranged. It seems to be a work of great value.—John Stead.

I am prepared to concur in the recommendation of the Honorable Superintendent of Public Instruction.—J. C. Pelton.

After as careful and thorough perusal of the same as it was in my power to give, I came to the conclusion that, for conciseness, correctness, and precision of definition, as well as for completeness and variety of style, it was, and would be, without a rival. I regard your work as the best of its kind. I know of but few men in any profession who would not be benefited by its careful study.—Wm. H. Hill.

I regard it as one of the best treatises upon these important branches—perhaps the only one obtainable possessing equal advantages—combining comprehensiveness with conciseness, and of such simplicity in its arrangements as to be readily understood by the advanced pupil.—E. W. Hatch.

It is admirably arranged to develop the correct idea of the analysis in the choice of language, and the application of ideas into sentences and periods. The style is clear, terse and pleasing. I do not hesitate to recommend it as a great acquisition to our text books.—James Denman.

I am happy to express my conviction of the value of the whole treatise. It would give me much gratification to see so thorough and excellent a treatise emanate from young California.—Martin Kellogg.

I recommend it to all those who wish to obtain a book that will give them definite ideas on this subject, and teach them to express their thoughts and feelings in a clear, simple, and forcible manner.—Caroline L. Atwood.

I regard the book about to be published as far superior to any work extant upon that subject.—Wm. S. Hunt, A. M.

I believe the work will be a valuable and much needed addition to our school text-books.—Herman Perry.

You have brought the results of a profound analysis, and made them available, in a practical form.—I. H. Brayton.

I can recommend it particularly to my young friends of the legal profession, as a source from which they may be able to learn much of value as special pleaders and as advocates at the forum.—John Curry.

The subjects upon which you treat have heretofore been too much neglected in the education of young men in America. \* \* \* Exactly calculated to interest. \* \* \* It will soon become a necessity in every lawyer's library.—Charles A. Tuttle.

Its clearness and comprehensiveness make it easy.—G. W. Boies.

A gentleman of varied learning and ripe culture, who has half a dozen languages at his tongue's end. He seeks to teach the student not only how to take sentences apart, but how to construct them. His system has the merit of originality. We know of no work in which can be obtained so lucid an exposition of the elements of composition, and such valuable assistance in learning how to put his ideas into language. Prof. Layres has done the cause of popular education good service.—S. F. Bulletin.

This is a San Francisco book by a San Francisco author. It contains 166 pages, and is altogether creditable to San Francisco. It meets a public want, and meets it in a form and size cheap and convenient, and in reach of the humblest.—Alta California.

The writer, the lawyer, the minister, or the statesman, may study its rules and definitions with profit. Nothing conduces more to the purity of a national literary taste than a general and thorough knowledge of the rules by which the construction of language is governed.—S. F. Times

Prof. Layres plunges at once "in medias res." He seizes a sentence (which is the unit in composition, whether written or spoken), holds it up before you; tears it to pieces before your eyes—if rather, we should say, neatly and skilfully dissects it—displays one by one its several parts; makes you thoroughly acquainted with each, in its entirety; and then shows you how to put them together again. A series of such experiments, increasing in complexity so gradually that you do not feel the difficulty, and the thing is done; you are master of the subject.—Mining and Scientific Press.

Its design is to show that ideas can be so arranged as to increase their power; in short, to teach the mechanism of composition, eloquence and oratory. A desideratum long felt is supplied.—S. F. Examiner.

This is an ace in which the occasions are rapidly multiplying, when educated men, and women, too, are called upon to express their views in writing, either for public or private inspection and criticism.—Stockton Independent.

The most eminent educators in California give it their hearty approval, and we concur.—Marysville Appeal.

Not only one of the best of its kind, but what is still better, one of the briefest. It contains 166 pages.—Virginia Enterprise.

Price, \$1.10. Sent by mail, postage paid, without extra charge. Liberal reductions made to the Trade, Teachers and Schools, ordering by wholesale. Orders received by our Traveling Agents.

Address DEWEY & CO., Mining and Scientific Press, San Francisco.

National Mineral Land Law, Instructions, Blanks, Etc.

Copies of the Act of Congress, approved July 26th, 1866, relating to the Location of Mineral Lands, together with the instructions to the "United States Registers and Receivers and Surveyors General," from the Commissioner of the General Land Office Department of the Interior, dated at Washington, Jan. 14th, 1867, can be had at this office. Also a full set of blanks for making applications, advertising, etc. Address DEWEY & CO., office Mining and Scientific Press, San Francisco.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-third day of November, 1867, an assessment of two dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, 318 California street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the twenty-sixth day of December, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the eleventh day of January, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees. T. B. WINGARD, Secretary. Office, 408 California street, San Francisco. no30

North Star Gold and Silver Mining Company, Reese River Mining District, Lander County, Nevada. Notice.—There are delinquent upon the following described stock, on account of assessment levied on the nineteenth day of September, 1867, the several amounts set opposite the names of the respective shareholders, as follows:

Table with 4 columns: Names, No. Certificate, No. Shares, Amount. Includes Oliver Ames, Cyrus Lathrop, Jerome W. Tyler, J. C. Tyler, Dan Blaisdell, John S. Keyes, J. Z. Goodrich, Thos. Dalby, Wendell Phillips, Clark C. Walworth, J. H. Tuttle, M. S. Scudder, Geo. Seodood, G. W. Warron, Geo. B. Neal, W. T. Reynolds, Geo. H. Faulkner, John H. Tuttle, Curtis B. Raymond, Jacob Hertz, Geo. H. Vincent.

And in accordance with law, and an order of the Board of Trustees, made on the nineteenth day of September, 1867, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the Company, No. 423 Front street, San Francisco, California, on Saturday, the seventh day of December, 1867, at the hour of 2 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale. GEORGE H. FAULKNER, Secretary. Office, 423 Front street, San Francisco, Cal. no23

POSTPONEMENT.—The above sale is hereby postponed until Thursday, the second day of January, 1868, at the same hour and place. By order of the Board of Trustees. GEO. H. FAULKNER, Secretary. de7

Oxford Beta Tunnel and Milling Company, Esmeralda District and County, State of Nevada. Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the eighteenth day of November, 1867, an assessment (No. 25) of fifty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, or to the Superintendent at the mine.

Any stock upon which said assessment shall remain unpaid on the twenty-sixth day of December, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the thirteenth day of January, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees. GEO. H. PECK, Secretary. Office, 212 Clay street, San Francisco. no23

Seaton Mining Company—Location of Works: Drytown Mining District, Amador County, State of California. Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-first day of November, 1867, an assessment of one hundred and fifty cents per share was levied upon the capital stock of said Company, payable on the twentieth day of December, 1867, in United States gold coin, to the Secretary, at the office of the Company, No. 60 Exchange Building, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the twenty-eighth day of December, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on the eighth day of January, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees. JOEL F. LIGHTNER, Secretary. Office, No. 60 Exchange Building, N. W. corner Washington and Montgomery streets, San Francisco, Cal. no23

Whitino Gold and Silver Mining Company, Location of Works: Indian Springs District, Lyon County, Nevada. Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the thirty-first day of October, 1867, an assessment of one dollar and fifty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, (room No. 10, 2d floor) No. 405 Montgomery street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the second day of December, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-third day of December, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees. T. W. COLBURN, Secretary. Office, room No. 10, 2d floor, No. 405 Montgomery street, San Francisco, Cal. no2

POSTPONEMENT.—The day for deeming stock delinquent on the above assessment is hereby postponed until Wednesday, the first day of January, 1868, and the sale thereof until Wednesday, the twenty-second day of January, 1868. By order of the Board of Trustees. T. W. COLBURN, Secretary. San Francisco, Nov. 27, 1867. no30

OLNEY & CO., Auctioneers and Real Estate Agents, attend promptly to all business entrusted to their care in San Francisco and Oakland. Mining and other corporations will find Col. Olney well posted and thorough in transacting sales of delinquent stock. Office, on Broadway, Oakland, and No. 313 Montgomery street, San Francisco. no10

Machinery.

VARNEY'S PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the PACIFIC FOUNDRY, San Francisco.

Hunt's Double-Action Pump

Is cheap, durable, strong, and not liable to get out of order. Built and on hand at No. 23 Second street, and 108 Jessie street. 12v15tr E. O. HUNT, Prop'r.

E. T. STEEN,

Commission Agent for the purchase and sale of

Engines, Boilers, Castings,

AND ALL KINDS OF MACHINERY.

No. 537 Washington, and 532 Merchant st., San Francisco HAS FOR SALE

- One Engine, 5-Horse Power, \$100
One Engine with Boiler, 7-Horse, 600
One Engine, Link for Hoisting, 15-Horse, 800
Two Engines, Boilers, Port., 14-Horse, 1,200
One Engine, 40-Horse, 1,200
One 30-Horse Boiler, 300

Also, a great variety of

Boilers and Machinery,

CASTINGS OF ALL KINDS,

AT LESS THAN MARKET RATES.

Parties wishing to purchase or sell Machinery, of any kind, can do so to advantage through this agency. 12v15qr

Steam Pumps,

FOR DRAINING MINES OR ELEVATING WATER TO ANY HEIGHT.

PICKERING'S GOVERNORS

For Steam Engines.

Giffard's Injectors,

For Feeding Boilers.

STODDART'S IRON WORKS,

Beale Street, San Francisco. 23v12 3m

PATTINSON'S

HURDY-GURDY WATER-WHEEL.

The inventor of this Wheel having, after much delay, finally obtained the patent for the same, is prepared to sell rights therefor to such as may be desirous of putting them up, or continuing those already in use. This is well known among miners as the "hurdy-gurdy wheel," and is considered the most economical Water-Wheel now in use.

Notice is hereby given, that the subscriber is the inventor and holds the patent right for the construction and use of the same; and that no person has a right to manufacture or use them without his permit. 7v16-qy THOMAS PATTINSON.

Brodie's Patented Improvements

FOR THE TREATMENT OF

Gold and Silver Ores.

BRODIE'S PATENT IMPROVED QUARTZ CRUSHER.

The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Smashing Quartz, or other rocks, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms: No. 1—Or 10-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price, \$600

No. 2—Or 16-inch Crusher, capable of similarly reducing through five to six tons per hour, price, \$850
No. 3—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour, price, \$1,200

EXPLANATION OF THE ABOVE ENGRAVING: The frame is made of cast iron, bound with heavy wrought iron bands, making it very strong, and at the same time light and portable. The crusher is bolted to a wood frame of sufficient height to clear the fly-wheel, and allow the crushed quartz to pass off. The dotted lines show the movable and stationary jaws. Letter A represents the eccentric shaft by which the power is applied direct to the movable jaw. B represents the movable jaw, and C the fixed jaw. D represents the link or radius bar. E represents the bolts for regulating the opening, F, which can be regulated at pleasure, so as to graduate to the size to which it is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designated.

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, D, gives the movable jaw, B, a forward and downward motion at the same time, and which makes the hardest rock yield and separate into fragments of any desired size.

The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Rawhide Ranch, Tuolumne county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Fulton Foundry, First street, San Francisco.

The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Rawhide Ranch" Mine, in Tuolumne county: RAWHIDE RANCH, Tuolumne Co., Sept. 23, 1866.

JAMES BRODIE, Esq., San Francisco.—My Dear Sir: It gives me pleasure to inform you that I have for the past three months had one of your latest sized Rock Crushers in use, at the Rawhide Ranch Mining Company's Mill, which has entirely met my expectations; and I have no hesitation in recommending it to all who are in need of a machine for rapidly, cheaply and properly preparing quartz for the stamps. Yours truly, R. P. JOHNSON, Supt. Rawhide Ranch Quartz Mill.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.

For the present it is not intended to grant licenses for the use of the improved German Barrel, for a longer term than twelve months. All persons desirous of compromise, without having recourse to legal proceedings, for past improvements, or of your interest in the use of this Barrel, in the limited period named, are requested to address as below. A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 25th, 1866.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—This Dry Crusher has been found the most economical and effective mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1866.

JAMES BRODIE, Fulton Foundry, or CHAS. E. RAY, Esq., Agents, Express Building, 402 Montgomery street, San Francisco. 12v13tr

E. O. HUNT,

Manufacturer of

Windmills, Horse-Powers, Pumps, Pumping Frames and Gearing.

HUNT'S ADJUSTABLE WIND MILLS to have all the sails arranged as turn edgeways to the wind when the mill is stopped. The sails can be set at any angle to suit the force of the wind, while the mill is running, by means of the brake lever at the foot of the mill, by any person.

HUNT'S SELF-REGULATING MILL is strong, durable and cheap. It is provided with means for stopping, in the most violent winds. This mill is well known throughout the State.

Tread Horse-Powers, Swap Horse-Powers, Pumps in great variety, Single and Double-Acting, Frames and Gearing for running pumps, from steam or other power, constantly on hand and built to order. Water Tanks built to order. No. 23 Second St., and 108 and 110 Jessie St. 2v15qr San Francisco.

DR. BEERS' PATENT WIRE GAUZE AMALGAMATOR.

THE ATTENTION OF QUARTZ, HYDRAULIC AND Placer Miners, is called to this new invention for saving Fine Gold. It is designed to furnish the miner with a cheap and simple apparatus by which the finest free-gold can be saved without loss, requiring little attention, no machinery to drive it, and will positively collect every particle of amalgam, or of waste mercury that may have escaped from mill or sluice, and as these particles are always charged with more or less gold, this item alone, in many instances, will more than pay the cost of this Amalgamator every month. For Circulars, and further particulars, address Dr. J. B. BEERS, San Francisco. 11v16 6m Per Wells, Fargo & Co's Express.

NELSON & DOBLE,

AGENTS FOR

Thomas Firth & Sons' Cast Steel, Files, Etc., Shear, Spring, German, Plow, Blister and Toe Calk Steel; manufacturers of

DEWEY & CO.,

Patent Agents, Publishers and Job Printers, 505 Clay st.

[Written for the Mining and Scientific Press.] Notes of Travel.

BENTON, Nov. 20, 1867.

The investigator of geological science, the tourist, or casual observer of nature, on passing from the western to the eastern slope of the Sierra will find new, and, in some respects, dissimilar phenomena at every step of his progress. A marked feature, everywhere apparent, leads to the conclusion that the period of volcanic action was continued to a much later period on the eastern than on the western slope. On the eastern side there is a marked similarity in geological features and unmistakable evidence of the very recent action of volcanic and igneous forces.

Descending from the high, precipitous, granite mountains, bounding Lake Tahoe on the north and east, into the Valley of the Washoe, with its little lake, without an outlet, narrowed by constantly encroaching sands to the size of a mill-pond, you are at no loss to understand why the Valley of the Washoe has its little pond of dead water, its wide sand plain, and its narrow margin of vegetation; for, in passing over the high, abrupt granite wall dividing Lake Tahoe from Washoe Valley, you encounter at every step loose sand from three to six inches in depth, and in some places even deeper—showing that the disintegrating forces are greater than the force of the mountain currents in sweeping the sands to the levels below. The wonder really is, that there is any lake at all, or any vegetation possible. May not the existence of Lake Tahoe—a grand and most beautiful sheet of water—be, to a large extent, accounted for from the non-disintegration of the rocks forming the narrow slope of the mountain wall encircling it? On the northeast, the granite sands have already encroached far out on the ancient domain of its waters. Otherwise, the Valley of Tahoe might have become a dreary sand plain.

From Washoe Valley, in a southerly direction, you enter Eagle Valley—where extends Carson City—an elongated sand plain, with a narrow strip of arable land. Here the same features present themselves as in Washoe Valley. Continuing south, you enter the great Carson Valley, or basin, having the same general features. The waters filling these valleys at some former period had an outlet to the south, in which direction you take your way, with low mountain ranges on either side. Crossing west and east Walker river, you enter Desert Valley, presenting the same features—an elongated valley, ten miles in length from north to south by five in width; the mountain stream sinking in its sands, and leaving, as it were, a hand's breadth of vegetable green to relieve the monotonous perspective.

Continuing southerly, you descend into Adobe Meadow Valley, twenty miles in length by ten in width. Reaching its southern extremity, along a granite wall encircling it on the east, but here growing narrower and dipping towards the plain, you find it pierced with outlets, and at length find an easy passage through, and down a long sand slope to the Valley of the Hot Springs, along the margin of whose waters reposes the town of Benton.

We shall here suggest what may interest some of your readers, that the valleys above mentioned, including Mono Lake Valley—an extended sand plain, along whose margin we passed—are evidently the craters of extinct volcanoes, which, upon their fires becoming extinct, filled with water, forming lakes; which, in their turn, have yielded their domain to the constantly encroaching alluvial formation of sand, pumice, tufa and scoria, which by disintegration, denudation and attrition, the mountain currents have carried down, filling up these craters to great depths, drinking up their waters, and forming over nearly all their extended surface vast sand plains. The axial line of the igneous force being uniformly nearly due north and south. As the length of the valleys, north and south, in proportion to their width, being as two to one, would seem to indicate. Low mountain ranges, strewn with the various forms of volcanic debris, encircle these valleys on every side; while to your right, in going south, rises in the distance the Sierra, with its sharp or rounded lofty summits and deep gorges, draped in its soft, wide-flowing robe of beautiful, many-colored light.

In my next, I will give you an account of mining about Benton and its vicinity. F.

A MILL FOR REDUCING CEMENT.—The Oroville Record says: Capt. Darrach and several other gentlemen have erected a mill for the purpose of working the cement, thousands of acres of which is found in this vicinity.

THE MANUFACTURE OF GOLD-BEATER'S SKIN is said to be a secret which only five men in the world now know. The art of preparing it has brought a fortune to the manufacturers.

The Chinese is the simplest of all languages, being easily traced to the roots with two letters. Egyptian comes next, having African roots, also of great simplicity.

BEAN'S HISTORY AND DIRECTORY OF NEVADA COUNTY, CALIFORNIA. Containing a complete History of the County, with Sketches of the various Towns and Mining Camps, the Names and Occupation of Residents; also, full Statistics of Mining and all other Industrial Resources.

FAIRBANK'S PATENT PLATFORM SCALES! Also, large Scales for weighing loaded wagons of Ore, Hay, etc., from 5,000 to 40,000 pounds capacity. Manufacturers' Branch House, FAIRBANKS & HUTCHINSON, 120 California street, San Francisco. Send for a Catalogue. 241400w6m

Pratt's Abolition Oil. FOR ABOLISHING PAIN—THE BEST REMEDY IN existence for Rheumatism, Neuralgia, Paralysis, Headache, Toothache, Sore Throat, Diphtheria, Weak, Swollen and Stiff Joints, Contracted Cords and Muscles, Cramps, Colic, Quinza, Cholera, Pains in the Breast, Lamé Back, and all aches and pains. It is the poor man's friend, and the best family physician. Full directions accompany each bottle. Price 50 cents and \$1 per bottle. For sale by all dealers in medicines. Sole Proprietors, A. McBOYLE & CO., Druggists and Chemists, 524 Sacramento street, opposite What Cheer House, San Francisco. 10y13-1y

Assayer and Chemist. A GENTLEMAN WELL VERSED IN ASSAYING AND Analytical Chemistry, is desirous of securing a position in some assaying establishment, or would take charge of the assaying and amalgamating department of either a gold or silver mine. Steady employment, rather than high wages, is desirable. The advertiser would take his own laboratory to the mine if desired. Proper references given inquire at this office. 3v15tr

Quartz Mill Construction and Superintendence. THE UNDERSIGNED IS AT PRESENT OPEN FOR AN engagement as a working Superintendant in the construction or operation of a quartz Mill. Has had five years steady and successful experience in working ores in Washoe, and is practiced in saving sulphurets and the treatment of rebellious ores. Is prepared to furnish references for all the necessary qualifications of an intelligent, faithful and reliable quartz operator. Address, F. M. SHAW, San Francisco, care Mining and Scientific Press. 20v143m

It is a Fact. That BOWMAN'S AMERICAN WASHING COMPOUND is the best article for Washing and Cleaning yet discovered. It is acknowledged to be a saving both in money and labor, as the compound softens the dirt, the clothes require not more than one-half the rubbing necessary in washing by the old method; besides all who give a trial acknowledge that their clothes are whiter in washing with this Compound than they were ever known to be by using any other preparation. For washing woolen goods and linens, it cannot be equalled. Garments that cannot be washed with soap without fading are washed in the water used for holding white clothes. This Compound has been used in the Eastern States for the past three years, with perfect success. WARRANTED NOT TO INJURE THE CLOTHES. For sale by all Grocers. LEVY & PARSONS, Agents, 15v15-3m 222 Jackson street, near Battery.

Copperas! Copperas! 75,000 LBS. IMPORTED COPPERAS-SULPHATE of Iron—for sale in lots to suit, by BENJ. BRADY, 103 California street, S. W. corner Davis, vs18tr. Economy in Advertising.—The MINING AND SCIENTIFIC PRESS is the best and most economical mining advertising medium in this city. Our terms are less than ONE HALF the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The Press contains, proportionally, a larger amount of mining ad. vertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

HAYWARD & COLEMAN, IMPORTERS AND REFINERS. Illuminating, Lubricating, and PAINT OILS! CONSISTING OF KEROSENE, LARD, SPERM, ELEPHANT, POLAR, TANNERS', MEATFOOT, ROILEO AND RAW LINSSEED, CASTOR AND QUINA TUT. SPIRITS OF TURPENTINE & ALCOHOL. Note.—We would specially call the attention of Mill owners and Engineers to our superior PARAFFINE OIL, which we manufacture from the California Petroleum. This Oil will not gum. Machinery thoroughly cleaned and lubricated with it will not heat, and after remaining at rest, can be started without cleaning oil. A sample can of our Paraffine Oil will be forwarded on application to us, as we desire a fair and impartial trial. Lamps and Lamp Stock! An elegant and complete assortment on hand. 19v13-3m 414 Front street, San Francisco.

NEW YORK PRICES. C. E. COLLINS, No. 603 Montgomery street, San Francisco. EXCLUSIVE AGENT FOR THE AMERICAN WATCH FACTORY. BELDUKE & CO., OF CONCORD, N. H., Long employed at the celebrated firm of Downing & Son, have opened a manufactory of Concord Wagons, Of all descriptions, at No. 820 and 822 Folsom street, between Fourth and Fifth streets, San Francisco. Orders received for Buggies, Expresses, and Light and Heavy Through-bags. Carriage Springs made to order. 18v15-1am-6m Mechanical Drawings. Persons wishing Mechanical Drawings can obtain the services of competent draughtsmen, by applying to this office.

Machinery. STEWART'S CELEBRATED HINGED Grinder and Amalgamator. Fig. 1, Fig. 2, Fig. 3. The Cheapest and Quickest Pan now used. It is flat-bottomed, loses far less power in throwing the pulp, and circulates the same under the miller to better advantage than any other Pan in use, while the steam, owing to the thinness of the cone, has a more direct effect of heating the pulp. It is the roller plate; F the Grinding Shoe, attached by an adjustable hinge joint, in the middle in the same—the bottom wearing down even with the dies. Mr. J. H. STEWART, the inventor, has had ten years of experience in mechanical operations, and may be addressed at San Francisco, or called on at the Miners' Foundry, First street, where his Pan is manufactured, and is to be seen at any time in operation. 14v15-1amtr

NOTICE TO MERCHANTS AND MANUFACTURERS. Moore's Patent Friction Hoist. Now in successful operation in the principal stores in San Francisco, possesses many advantages over the common Hoist—viz: Greater strength; less danger in working, as goods require no slinging or lading, consequently make fewer breakages; requires one man less to operate it; stops with the load at any point, without any lashing or attention from the operator. The undersigned take this opportunity to notify all whom it may concern that they have secured, by letters patent, the application of a friction pawl, or stop, to hoisting machines, and that they will prosecute any party making or using any machine infringing upon the same. VULCAN IRON WORKS CO. By JOSEPH MOORE, President. 21v15-1f JOSEPH MOORE.

BLAKE'S PATENT QUARTZ CRUSHER. CAUTION! The owners of the Patent for this valuable machine, in order to facilitate the protection of their rights against numerous infringers, procured, some time since, a reissue of the Patent, bearing date January 9th, 1866. This Patent secures the exclusive right to employ in Stone-Breaking Machines Upright Convergent Drives, actuated by a Revolving Shaft. All persons who are violating the Patent by the unauthorized making, selling or using machines in which quartz other material is crushed between upright convergent awa, actuated by a revolving shaft, are hereby warned that they are appropriating the property of others, and they will be held responsible in law and in damages. Several infringing machines are made and offered for in this city, upon which Patents have been obtained. Manufacturers, purchasers and users, are notified that such Patents do not authorize the use of the original invention, and that such machines cannot be used without incurring liability for damages. BLAKE & TYLER, 14v14tr Agents for the Pacific Coast.

Notice to Miners, Well-Borers and Water Companies. M. FRAC IS NOW PREPARED TO MANUFACTURE Hydraulic and Artesian Well Pipes in the best workmanlike manner, and at the lowest market rates. Having made large additions to my stock of machinery for that branch of business, I am prepared to fill all orders with dispatch, and guarantee entire satisfaction. I also manufacture Mississippi Stoves, of the latest improved pattern, for vessels of all classes. Also, Ship Plumbing done in the best manner. M. FRAG, 8v13-1y Stove Store, No. 125 Clay street, below Davis.

A FULL ASSORTMENT OF MACHINE SCREWS AND TAPS, Constantly on hand and for sale by CHAS OTTO & CO., 312 Bush street. 2v15-3m

A FULL ASSORTMENT OF TWIST DRILLS, At low prices, being sole Agents for the manufacturers, (the Manhattan Firearms Company) CHAS OTTO & CO., 312 Bush street, San Francisco. 2v15-3m

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the Mining and Scientific Press, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

THE SAN FRANCISCO DIRECTORY for 1867-8, compiled and published by H. G. Langley, Esq., is a complete work of the kind, containing a large amount of information respecting the city and county, which is not only interesting at the present moment, but will be valuable for future reference. Besides being a full directory of residents, as also of business houses and of streets, with a map of the city, lists of societies and organizations, of Municipal, State and Federal officers, of periodicals, public means of conveyance and transportation, incorporated companies, etc., etc.,—it gives a chapter on the progress of the city, with tables showing its population for 1860, 1861 and 1867, the assessment and rates of taxation from 1850 to 1867, the municipal expenditures for the past two years, and the bonded debt of the city up to July last. The city improvements made during the past year, and now in progress, and all new buildings of importance, with the cost of each, are noticed in detail. The recorded sales of real estate for each month, with the figures, are given, showing the amount to have been nearly fifteen and a half millions of dollars for the year ending July 31st. A general review is also given of public schools, private educational institutions, religious and benevolent societies, hospitals, literary associations, banks, water companies, libraries and manufactures, with such particulars as are important in the history of each from its beginning. A chronological history of the principal events of the year is given. The Consolidation Act, with its amendments, and several laws relating to the municipal government, are included in the appendix. The whole furnishes a complete picture of the city at the present time; and impresses one most forcibly with a belief in the future glory of this Pacific metropolis. A city of seventeen years' growth, with a population of one hundred and thirty-two thousand, and an annual property assessment of ninety-six millions,—where real estate to the amount of a million and a quarter changes hands every month—a "city of homesteads"—more favorably situated for expansive growth than New York, and bound to be linked with that city within two years, by the iron thoroughfare which is rapidly and surely stretching itself in long strides across the continent, she is destined at no distant day, to take rank with her Atlantic rival, as of equal importance among the great centers of the world's trade.

**How to CHOOSE MEAT.**—Good meat has a mottled appearance, from its inter-cellular fat; it is neither pinkish nor of purple tint; it is never wet. The fat of good meat is somewhat elastic and hardly moistens the finger. Diseased meat is soft and watery, and moistens the finger freely. Good meat loses but little in cooking; bad meat shrivels up and discharges, in frying, broiling or boiling, a large amount of water. Good meat, as above described, looks bright, and shows a clear and well defined fiber, under the microscope, free from infusorial animalcules; while poor and diseased meat looks sodden and cadaverous, as if it had been soaked in water, while the fiber is indistinct, and almost always shows infusorial animalcules under the microscope.

**PAPER BONNETS** are coming into use again, made, however, on an entirely different plan from the original "Navarino," which were simply paper stamped so as to appear like straw. The material is now being made from Manila pulp, molded on a block, then spread with dissolved shellac and covered with woolen flock or clothiers' waste, and pressed till it has a velvet appearance. These may be of any color. At present the demand is great; but they can be made at less cost than by any other process, not exceeding ten cents. Material produced in manner above described, is susceptible of being made to appear very beautiful and quite susceptible.

**CHALLENGE FOR TWO THOUSAND DOLLARS,**

—AND THE—

"GOLD MEDAL."

**THE EXCELSIOR PUMP COMPANY**

Hereby challenge Mr. THOMAS HANSBROW in the above amount, to a Mechanical Trial between his "Challenge Pump" and the "Excelsior Pump," the trial to take place in San Francisco, before a

**COMMITTEE OF MECHANICS,**

Each Pump to be constructed in accordance with its patent, and to be tested from their least to their greatest capacity, together with the power required by each Pump. A meeting for settling arrangements for the trial may be had at the office of the MINING AND SCIENTIFIC PRESS. This Challenge open for sixty days.

**The "Excelsior Pump"**

Was NOT entered for the GOLD MEDAL, at the recent State Fair, as it was verbally agreed, by Mr. Hansbrow and Mr. Hooker, that they would not enter their Pumps for the Medal, as no means were provided for testing machinery, and believing that

**Policy, not Merit of Machines,**

Was to govern the award of prizes. The inference is clear—hence the above Challenge.

OF THE

**American Journal of Mining**

Volume III, Commencing March 3.

In consequence of the remarkable success that has attended this Journal, the proprietors feel warranted in increasing its size to

**Twenty Pages,**

Thus making it the LARGEST and most COMPREHENSIVE Mining Journal on this continent, representing the Gold, Silver, Copper, Iron, Lead, Coal, Slate, Oil, and in fact all the Mineral interests of America, containing beautiful engravings, illustrating the latest improvements in mining, mining and metallurgical machinery.

The Journal has won the encomiums of the press of the entire country and Europe, and numbers amongst its contributors more eminent scientific men than any other weekly publication in America.

The reports of the markets in stocks, metals, minerals and ores, carefully corrected weekly, are an important feature of the Journal.

Subscriptions: \$4 per year; for six months, \$2.25—in advance; single copies, 10 cents. Specimen copies sent free. Address, WESTERN & COMPANY, Publishers, 37 Park Row, N. Y.

**Life Insurance--The Money Drift.**

**ERRORS ALTA**—Sirs.—I read in your issue of the 11th, a very important statistical paper, compiled by you from the Federal revenue returns, which proves the astounding fact that the distant Life Insurance Companies plying in California through "Agents," draw away nearly one million dollars per annum.

The drain under this head, as you state it, amounts to—  
Year ending 1st August, 1866.....\$496,239  
Year ending 1st August, 1867..... 877,264

And as we write the drain increases and must be now near a million a year—to be a million and a half next year, and so on.

And you naturally ask with surprise why this matter has not been taken in hand by some of our enterprising insurance men, so as to arrest the flight of a moiety at least of this enormous drain.

I think, sirs, your question is well put, and though my hands are full, I am yet willing to step forward and assume some of the responsibility and bear some of the preliminary expenses of forming such a Company.

When you reflect, sirs, that this million dollars a year is carried over land and sea, thousands upon thousands of miles, to places where it is lent out by distant Managers and Directors to their manufacturing and commercial friends around them, at five per cent. per annum, while our merchants and manufacturers, who are to compete with these, have to pay fifteen per cent. per annum for money [we supply them with the golden weapons to beat us] you will then conceive the magnitude of the injuries effected by the sapping and mining operations of those distant Insurance Companies. The money which must drain away, day by day, steamer after steamer, from our people, will, if not stopped, impoverish this country quite as much as if it were conquered by a foreign power and held in perpetual tribute. A million a year, by compound interest, will be ten millions in five years, twenty millions in ten years, forty millions in fifteen years, eighty millions in twenty years, one hundred and sixty millions in twenty-five years, three hundred and twenty millions in thirty years! I will admit that the ordinary percentage of deaths on a business of thirty years will effect a drawback of one-third of the income, which in thirty years we will put at one hundred millions. Notwithstanding this, if we go on at our present mode of drawing, we shall in thirty years lose by the insurance operation two hundred millions of dollars! But our drain, if we don't stop it, will not stand at one million a year; it will increase year after year from one million a year to two millions a year, which, by my foregoing computation, would in thirty years foot up to four hundred millions! What it would amount to in sixty years I leave to other calculators. In round numbers, I should guess it would come to the full number of dollars equaling the national debt of the United States!

Now, sirs, I care not what may be said of me by critics or jealous opponents, some of whom cannot see farther than their own noses. I announce myself as ready to make an effort to stop this drain, and I hold every man who co-operates with me in benefactor of his adopted country.

Let the capital of a Local Life and Health Insurance Company be one hundred thousand dollars to begin, in shares of one hundred dollars each. I shall cheerfully take the names of co-operators in a book opened this day, in the office of the California Building and Savings Bank, California street, for that purpose.

I remain, your obedient servant,

THOMAS MOONEY,  
Building and Savings Bank, California street,

**Patent India Rubber Paint and Cement**

Is composed of India-rubber and other gums, dissolved in pure linseed oil, mixed with the various coloring matters, and ground in any color. We paint Wood, Brick, Metal, Cloth, etc. It is a superior Marine Paint. Will not rot, peel, blister or crack in any climate. Fifteen hundred Fishing Vessels at Gloucester, Mass., use it as superior to other paints. We refer to Steamers America, Senator, Paul Fry, Julia, etc., and W. E. Van Allen, S. C. Bugbee & Son, Tubla & Co., C. W. Thomas, Sidney Johnson, Dr. Heuston, Gen. Connor, Stockton, H. L. Davis, Jas. Lick, J. P. Pierce, Esq., and others. Filbert Street School House, two coats on redwood, equal to three coats lead. One hundred pounds paint equal in bulk to two hundred pounds lead. Cementing and painting new or old Tin or Metal Roof. We first cement around fire walls and skylights all holes and cracks, then apply a good coat of paint. A good, clean, tight roof is certain. Price, from one to three cents per square foot, according to size and condition of roof.

**New Cloth Roofs** put on, saturated with liquid rubber; then painted at nine cents per square foot. We use none but the best materials and pure linseed oil. No lead turpentine; neither asphaltum or coal tar.

Also, for sale, "Sunmarine Rubber Varnish," \$5 per gallon; any color. We will apply to Vessels' Bottoms, or furnish at \$5 per gallon. 23v15tf

## Dunbar's Steam Piston Packing.

One of the main essentials to the economical working of a steam engine, is a proper piston packing—one that shall not wear unequally upon the surface of the cylinder, but which, at the same time, shall fit so easily and closely as to be perfectly steam tight. Connected with these conditions is also the requirement that the packing must be readily adjustable, and work with the least possible friction. So far as we have been able to learn, nothing has ever been offered to the public which more fully meets the requirements of such service, than that which is known as "Dunbar's Steam Piston

Several who have used this packing have assured us that it saves each season many times its cost in friction, time and power. It can easily be fitted to old or new pistons. It is but little liable to get out of order, and offers no chance for an unskillful engineer to tamper with it to the injury of his cylinder.

In order that such of our readers as are unacquainted with it, may form an idea of the principle of its construction, we give herewith a full illustration of it, both in parts and as a whole:

Fig. 1 represents a piston with rod complete.  
 Fig. 2 represents a plain packing ring cut once each side of a T shaped or solid ring.

DUNBAR'S STEAM PISTON-PACKING RINGS.

Packing." This packing was first patented August 14th, 1860, and re-issued 1865. A patent was also granted Oct. 31, 1865, on his single ring packing. This packing is in very general use at the East on railroad, stationary and marine engines, and is in use on about four hundred engines on this coast.

Perhaps in no part of the steam engine have greater improvements been made during the past century than in the packing of the piston. Those who recollect the way in which the old hemp packing was wound and pressed into a groove around the old-fashioned piston head, can fully appreciate the modern improvements in this direction. Then the engineer had to repack his piston almost every day, and use a large amount of oil at that. Now a piston will often run a full year without repacking. The introduction of babbit metal, which followed the use of hemp, was but a slight improvement, and both involved a large amount of friction. The springs and set-screws connected with the earlier use of rings was a source of much trouble, especially in the hands of hungling or careless engineers. Indeed, their most careful use is necessarily attended with most unequal wearing of the cylinder, in consequence of the inequality of beating given by the screws.

In the use of Dunbar's rings all necessity for springs or screws is avoided; the packing is always tight, without excessive friction, and it never gets slack or leaky.

Fig. 3 represents a plain packing ring cut into four segments each side of a T ring.

Fig. 4 represents a spiral spring placed in one joint of Fig. 3, to hold the other three joints firmly together and out to the cylinder.

Fig. 6. Letters *a d* and *c* show a continual view of view of tongue piece to break the joint of rings Fig. 2. Letters *A* and *B* show the tongue piece in the edge of the rings, doweled into the flange of T ring, to keep the rings from revolving.

Fig. 7. Letters *d c* and *d f* is an angle piece to cover the joint of Fig. 3, at the spiral spring.

Henry S. Smith, of the *Ætna* Iron Works in this city, has the agency for this packing for the Pacific coast.

PATENTS RECEIVED.—The following patents were received at the MINING AND SCIENTIFIC PRESS PATENT AGENCY by the steamer of Friday:

- John D'Arcy, San Francisco—Loaf Bread Machine.
- Dr. W. C. Kellum, San Francisco—Improvements in escapements for time-pieces.
- John Synnot, San Francisco—Writing apparatus for the blind.
- Charles Colby, San Francisco—Improvement in churns.
- Walter Pierce, Onion Valley, Cal.—Improved Rock Drilling Machines.
- Alfred Horn, Virginia City, Nev.—Improvement in amalgamators.
- Henry Goulding, Silver City, Nev.—Improvement in furnace for roasting ores.
- Wm. B. Lamb, of this city—Improved watch escapement.

## The California Geological Survey.

We condense the following from a paper read by Prof. Whitney, on the 2d inst., before the California Academy of Natural Sciences, on the condition and progress of the State Geological Survey:

The Geological Survey has now been going on seven years. The plan of the Survey, as gradually developed during the work, is divided into three principal departments, each of which is sub-divided into subordinate branches, as follows:

- A.—TOPOGRAPHY—1. Topographical Maps. 2. Physical Geography.
- B.—GEOLOGY—1. General Geology. 2. Paleontology. 3. Economic Geology, including Mining and Metallurgy.
- C.—NATURAL HISTORY—1. Botany. 2. Zoology.

To the above must be added the collection of a museum of Geology and Natural History, to illustrate the geological structure and resources of the State and Pacific Territories.

The following scheme shows the lowest and highest number of volumes contemplated in each department, according to the thoroughness with which the work is completed, and that completeness depending on the liberality of the State in her appropriations:

	Lowest.	Highest.
Physical Geology .....	1	1
General Geology .....	1	2
Economic Geology .....	1	3
Paleontology .....	2	2
Botany .....	1	2
Zoology .....	3	4
Maps .....	1	1
	11	15

Quite a full resume of the work of the Survey to the close of 1865 having been given in the preface to the volume of Geology already issued, the Professor confined himself in the paper read chiefly to the work which has been accomplished within the past two years.

### FIELD WORK OF 1866.

Messrs. W. M. Gabb and F. E. Brown commenced January 4th, 1866, a geological exploration of the Southern Coast Ranges, with the special purpose of obtaining materials for the paleontology of the tertiary rocks, and to determine the geological position and economic value of the bituminous materials found in Los Angeles, Santa Barbara, and San Louis Obispo counties. Mr. Hoffman joined the party in April, to take charge of the topographical work, and the work was prosecuted northwardly to and including the Mount Diablo range, till June, when Mr. Gabb, assisted by Mr. F. Coffey, passed to the northward of San Francisco, to continue his geological researches into Sonoma, Mendocino and Humboldt counties.

Another party, consisting of Messrs. G. King, J. T. Gardner, H. N. Bolander and C. R. Brinley, commenced the geological and topographical survey of the Yo-Semite Valley, the first week in June, the principal object of which was the preparation of the map and Yo-Semite Guide Book, authorized by the last Legislature.

During the early part of the season Prof. Whitney was with one or the other parties mentioned; but in August he repaired

ART SCHOOLS.—It is reported that a University of Art is to be established in the United States. There are no less than ninety schools of art in Great Britain. A large amount of money is annually appropriated by the Government for the support of these institutions. The object is especially the cultivation of taste in design, in order to give British manufactures the same advantages for which those of France have been so long noted. These schools are organized into one department, under the management of a Board of Inspectors. An institution upon a somewhat similar plan, at least so far as regards the Governmental aid, would, without doubt be a success in this country. If, at the same time, arrangements could be made by which deserving pupils could be personally aided, and gratuitously taught, it would be well. It would, for instance, enable many women of culture and refinement, who have been thrown by the events of the past few years upon their own resources, to secure for themselves congenial employment. The attention of writers and lecturers has of late been turned toward the pointing out of some means whereby such women can gain an honest independence without a resort to the needle with starvation. Here now is the very thing.

THE NATIONAL AMERICAN.—The "American Industrial League" has issued the first number of a new monthly, in quarto form, under the above title. The Secretary of the League, John Williams, known as the editor of the *Iron Age*, and Dr. William Elder, late Chief of the Bureau of Statistics, will belong to the editorial corps. No subject is, to an American, of greater importance, and none should be of greater interest, than that of political economy. This publication, therefore, promises to fill a place in our periodical literature which has been void. The first number contains letters from Peter Cooper, and E. B. Ward, and the address of Horace Greeley, at the opening of the American Institute. Regular contributions from other men of note, who have given industrial questions special attention, are promised.

QUICK TIME.—The steamship Rising Star arrived in New York on the 8th inst., with passengers from San Francisco, Nov. 19th—the passage having been made in the short time of 19 days and 21 hours!

to Plumas county, to make a geological and geographical survey of the same. The Professor was assisted by Mr. Wackenreuder, and at short intervals by Messrs. A. Hartwig and A. W. Keddle. This party remained in the field as long as the season would admit, including a part of Sierra in their work. Considerable other detached field work was done during the same time by a portion of the parties mentioned, and others, particularly in Kern county.

Mr. S. F. Peckham made a special detailed examination of all the important oil bearing localities in the State, for the purpose of collecting samples for chemical examination, and to obtain information in regard to the economical value of the bituminous substances in those regions. The examination of these productions was carried on by Mr. Peckham, during the ensuing winter, at Boston and Providence, and the results obtained will be embodied in the volume of economical geology.

#### THE FIELD WORK FOR 1867,

Comprised within its scope geological and topographical surveys of the foot-hills between the Chowchilla and King's rivers, and the elevated region about the head of the Merced and upper portion of the Tuolumne rivers, including the interesting valley, called by the Indians Hetch-Hetchy, an almost exact counterpart of the famous Yo-Semite Valley. The topographical work in Kern, Tulare and Inyo counties has also been continued. This portion of the survey has been plotted on a scale of two miles to the inch, and embraces an area of 100 miles north and south, by 50 in breadth, and includes all the settled portion of Kern county, half of Tulare, and the western part of Inyo, embracing the whole of the Sierra Nevada from Walker's Pass to the parallel along the lower end of Owen's Lake. Mr. Wackenreuder has also been engaged during the entire season in the central portion of the Sierra Nevada. He has made several trips along the Sierra, between Alpine and Plumas counties, completing the high part of Alpine, Calaveras, Amador, El Dorado and Sierra counties. Three months additional work will enable him to plot the whole of the Sierra Nevada, on the largest scale required, from Walker's Pass to Lassen's Peak—about 400 miles in a direct line. An extensive reconnaissance has also been made at the joint expense of the General Government and Prof. Whitney in Southwestern Nevada, including the White Mountain range and the Pahranaigat country as far east as the 116th meridian, when the season compelled the party to leave the field. This expedition was conducted under the supervision of Mr. W. M. Gabb, assisted by Messrs. Loehr, Wilson and Poston, and was undertaken for the purpose of making the necessary surveys to complete the southeastern portion of the Central California map. The State was charged only with that portion of this reconnaissance which was made within the territory of the State of California.

The area of the region surveyed during the past four years, including only the extremely difficult work in the "High Sierras," is about 20,000 square miles, or 50 miles in breadth by 400 miles in length. The counties in which the work is deficient are Tuolumne, Nevada and Placer.

During the past two years the State Geologist has been actively engaged within the State, attending to the necessary work of the survey in all its various departments, with the exception of two short periods—one of four weeks in Oregon and Washington Territory, and the other of two weeks in Nevada. Each of these excursions were made for the purpose of settling important geological and geographical questions intimately connected with the State Survey.

[Prof. Whitney states in connection with his notice of these trips, that no charge whatever was made to the State either for his salary or expenses thus incurred. We trust,

however, that the Legislature, in view of the importance to his work within the State of such trips, will not suffer such necessary expenses to come from the private means of the State Geologist.]

#### PROGRESS IN THE SEVERAL DEPARTMENTS.

Having thus taken a general survey of the field work for the past two years, the Geologist proceeded to summarize the progress made in the separate departments. We propose to follow him with a very brief synopsis:

1st. *Topography and Maps.*—By far the largest amount of expenditure, during the past two years, has been devoted to this department of the survey. The reasons given for this, were two-fold. First—Because the resignation of Prof. Brewer, (who left to take a Professor's chair in Yale College,) and the decease of Mr. A. Remond, deprived the Chief of the Survey of his principal geological assistants; and the appropriation was too small to enable him to engage other parties, without dismissing a portion of his topographical staff, who had already a large amount of work on hand, and in such a condition that it could be made of but little future value if discontinued at the time, especially with the necessity which appeared of its finally going into other hands, if resumed at all. Second—The want of any, even approximately correct maps, of any part of the State made it entirely impossible for the detailed geology to be worked out, without first forming such maps. With the imperfect maps at hand, the Geologist could neither lay down the placer or quartz mines, nor indicate the different strata cropping out at the surface, or make a description of the geological structure of the country intelligible in any other than a general way. An accurate geographical map must be the basis of any geological work, which is to be of any economical advantage to the people of the State.

The general plan of the topographical maps of the survey, embraces maps on four different scales—the first and largest is that of a mile to two inches. This will be adopted only for the most important mining districts, where the special illustration of the occurrence of veins or mineral deposits makes a large scale necessary. The second is two miles to the inch; this will be adopted for the Bay map, and for the several county maps. The third is six miles to the inch, and will be adopted for a map representing the central portion of the State, embracing only one-third of its area, but ninety-five per cent of its population. The fourth is a scale of ten miles to the inch, which will be adopted for the general map of the State.

#### WHAT HAS BEEN ACCOMPLISHED IN THE PREPARATION OF THESE MAPS.

*A Mile to two inches.*—On this scale a map of Mt. Diablo and vicinity has been completed, and is now ready for the engraver. This map is two and a half by three feet in size, covering an area of one hundred and seventy square miles, and embracing all the most important coal deposits yet discovered in the State. The map of the Yo-Semite Valley, fifteen by twenty-four inches, is also on this scale.

*Two Miles to the inch.*—A map of the Bay of San Francisco and vicinity, has been drawn and engraved to this scale. It covers an area of 4,248 square miles—a territory equal to the State of Connecticut—of the most densely settled portion of the State, embracing the heart of our agricultural and commercial interests, and over one-third of our population. Copies of this map are on the way from New York.

Three other maps of the central counties of the State, along the Sierra Nevada, and including our principal mining districts, have also been projected on this scale. Of these, the northern embraces all of Plumas and Sierra, parts of Yuba and Butte counties; the central, all of Nevada, Placer, El Dorado, Amador and Calaveras, portions of Sutter, Sacramento and San Joaquin; the southern, part of Calaveras, all of Tuolumne and Mariposa, and parts of Stanislaus, Merced and Fresno counties. These maps are intended to show the minute details of the topography, the position of all towns, villages and mining camps, ranches, roads, mines, mills and ditches. The field work for Plumas and Sierra is nearly completed; that for the central and southern counties is about one-third completed. A map of that portion of the Sierra Nevada, adjacent to the Yo-Semite, embracing from 2,000 to 3,000 square miles, the roughest and most picturesque region

of the State, is completed and in the hands of the engraver. This map is intended to accompany the Yo-Semite Guide-Book, ordered by the Legislature, and will be the first accurate map of any high mountain region ever prepared in the United States. Much other territory, not enumerated above, has been plotted to this scale for future use in a general map of the State.

*Six miles to the inch.*—This is the scale adopted for the Central California Map, which will embrace an area of about 80,000 square miles. It will be printed on four sheets, each 24 inches square, to be put together for use as a wall map. It will require two years to complete this work, and when finished will be the largest inland work of topography yet undertaken in the United States. A large portion of the territory embraced is very mountainous, and includes the highest and roughest in the country, and probably on the North American continent.

Enough has already been done to give a very good idea of the western and central portion of the State, and to make the worthlessness of all other maps heretofore compiled appear perfectly evident. The region of country embraced by this map is twice as large as that of Ohio.

A map of the coast region, south of Monterey, has been commenced on this scale, the field work of which might be completed in six months. This map will be 3 by 2½ feet in size, and embrace 16,000 square miles.

*Ten miles to the inch.* will probably be the scale adopted for a general map of the whole State, which would have to be about 5 feet square, and would necessarily embrace a large portion of Nevada, unless that State should be left blank. A large portion of the material for this map has of course been collected in the preparation of those already noticed. The principal part of the work which yet remains to be done is in the southeastern and northwestern portions of the State, which are thinly inhabited, and in which the work cannot now be done except with the presence of a military escort. Before this map can be completed, a system of carefully conducted astronomical observations should be made to fix the positions of a considerable number of points on the sheets already prepared. Until this is done we can never have even a tolerably correct map of the State, as there are errors and discrepancies in the work of the U. S. Land Office, which can be cleared up only by such a series of observations.

#### PHYSICAL GEOGRAPHY.

The collection of materials in this department have gone on uninterruptedly. The number of barometrical observations to determine the heights of important points has been greatly increased during the past two years. The important investigations of Col. R. S. Williamson in regard to the fluctuations of the barometer on this coast, are now in process of publication. As soon as that volume is published a revision of barometrical observations already made by the Survey will be commenced, and the corrected results will be tabulated, and a close approximation to the heights of from one to two thousand points will be given. These results will be of great practical as well as scientific value.

The investigation of other subjects connected with the physical geography of the State have been continued, and among them the nature and distribution of the forest trees has been found of peculiar interest. A beginning has been made in the construction of a map which will show the boundaries and areas occupied by the principal groups of trees.

#### GENERAL GEOLOGY.

For reasons already stated, much less progress has been made in the strictly geological, than in the topographical department. Still, as has already been shown, a very large amount of work has been done, and a large amount of material has been collected for the second volume of Geology. This volume, however, will be the last one published of the series, as it will be designed as a complete resumé of all the geological and paleontological work. It will also be accompanied by all the necessary sections, showing the structure of the mountain ranges, and with a geological map of the State, and probably of all the Pacific States and territories.

#### PALEONTOLOGY.

But little exclusively paleontological work has been done during the past two years, as Mr. Gabb has been employed in the field during most of the time when in the service of the Survey, as will be observed by the synopsis of the field work already given. Most of the work performed has been in the way of arranging the collections already

made, and selecting such as were needed for description. Of this, more will appear under head of "Progress in the Publication Department."

#### ECONOMICAL GEOLOGY.

It is proposed in this department to prepare first that part of the report which includes the non-metalliferous minerals—such as coal, all bituminous substances, petroleum, asphaltum, building materials, mineral paints, fire-clays, etc.

No plans, however, can be made for embracing the metalliferous mines of the State, unless more liberal appropriations are made, such as will enable the State Geologist to secure competent assistants, by the aid of whom that work can be thoroughly done. If properly executed it cannot fail to be of the greatest value to the State. Superficial investigations will be of no advantage.

#### BOTANY.

The collection of materials for the botanical report has been continued during the past two years in such a manner as to be but a trifling expense to the State. Mr. Bolander, who has had charge of this department, has made extensive additions to the material previously collected. Indeed, so many new discoveries have been made that the working up of the material at the East will occupy a longer time than was anticipated. Mr. B. was in the field about five months in 1866. He also made two extended excursions in 1867. Prof. Brewer thinks that the volume under his charge will be ready for delivery during the coming year.

#### THE COLLECTIONS OF THE SURVEY

Still continue where there is no probability of their being of any very great practical importance to the State. They are large and valuable. Some work, however, has been done towards getting this mass of material in order. A part of the minerals are laid out upon shelves. The fossils are arranged in drawers and partially named. The shells of living species have also been arranged, named and labeled. These collections can thus be examined and studied, and are, to some extent, by those interested.

The plants have been placed in cases, arranged in families and genera, so far as known, and specific names are added as fast as received from the various authorities engaged in working them up. The cones of all the pines, firs and spruces, with seeds, fruit, etc., have been arranged in drawers, and the cryptogamic vegetation, also, so far as worked out.

#### PUBLICATIONS.

Progress has been made in this department, since the last session of the Legislature, as follows:

*Paleontology, Vol. II, Sec. I, Part I*, comprising the first installment of the Tertiary Invertebrate fossils, by Mr. Gabb, with their ten plates, is nearly ready for delivery. The text has been stereotyped. It is expected that the whole of this volume will be required for the remainder of the Cretaceous and Tertiary invertebrate fossils. A third volume will be required for the Secondary and Paleozoic fossils, the plants, vertebrate remains, and microscopic fossils. The materials for the same are already in the hands of eminent authorities in the East.

*A Geographic Catalogue* of the mollusca, found west of the Rocky Mountains, prepared by Dr. Cooper, has been printed. It contains the names and localities of eight hundred and twenty-five species.

*Mining Statistics, No. 1*, containing a list of quartz mines and mills, between the Merced and Stanislaus rivers, etc., etc., prepared by A. Remond, and printed.

*In the Zoological Series*, the drawings and engraving for the volumes of birds and fishes has been going on steadily. The former is nearly ready for the press. Arrangements have been made for editing a volume of conchology, and a beginning made in the mammals. The progress on the several maps has already been briefly referred to in our abstract under the head of "Topography and Maps."

The accounts of the Survey, and a complete statement of all the expenditures of the different departments will be submitted to the Legislature at an early date. The following statement was given in the paper as read:

STATEMENT OF EXPENDITURES OF GEOLOGICAL SURVEY.	
To Dec. 31, 1865, as per account rendered.....	\$39,008 71
January 1, to December 1, 1866.....	22,617 66
January 1, to September 30, 1867.....	15,853 40
Estimate for October 1, to December 31, 1867.....	5,600 00
Total amount of Appropriations.....	\$134,069 77
Deficiency at the end of 1867.....	\$8,496 77

An appropriation of \$15,000 is asked for the continuance of the Survey through the present fiscal year, and if this is not granted, the Survey will be stopped at once.

## Mechanical.

## Steel Boilers.

We notice an advertisement by Nelson & Doble, of a quantity of steel plate, recently received from the manufactory of Firth & Co., (of whom they are the agents), suitable for making steel boilers. The introduction of steel boilers is a subject of great importance to California, and we have no doubt that before long this will form another of the advances in machinery made in this State.

It is strange that in this country, where transportation forms so important an item, and where high pressure steam is used, perhaps more than in any other part of the world; and where, in many places, fuel is very expensive, so little has been done in introducing steel plate, instead of iron.

The United States government has made certain laws to govern the thickness of plates, diameter of boilers, and pressure of steam allowed to be carried in steamboat boilers; but no such law exists in relation to boilers used on land. The consequence is, that while the steamboat boilers have to be made in conformity to such laws, and to the approval of the United States Inspector, the land boilers are made oftener after the whims of men who may be able to stop, start or run an engine; but who are utterly unfit to plan a boiler, or say under what pressure or thickness of plates it will work. The objects to be kept in view in proportioning a steam boiler are, cheapness, safety and economy of fuel:—Cheapness, in the ordinary class of boilers, by making them large, in order to make one boiler answer instead of two; safety, by having them properly braced, and by having the sheets as thick as possible; economy of fuel, by having the plates as thin as possible; other things, such as circulation, etc., not dependent on the quality of material, being equal.

The United States law, already referred to, sets the limits of CH No. 1 American iron at 9,240 pounds tensile strain to the square inch, and objects to give a certificate, even to that strain, with plates over  $\frac{1}{2}$ -in. thick; but makes no objection to 5-16 and  $\frac{1}{4}$ -in. iron—not distinguishing between single and double riveted seams. Now, it has been proved by very careful experiments, that the thinner the iron, the more readily heat is transmitted to water; and that with steel plates instead of iron, more water can be evaporated with a pound of coal. From the greater strength of steel, thinner plates can be used, thereby accomplishing the object of larger boilers, with the same thickness of plate; or thinner plate with the same diameter of boiler, and consequently a saving of fuel. Steel shows less liability to rust, or waste with bad water—another valuable property.

We believe there has only been two steel boilers made in California up to the present time. These were made for the Almaden Quicksilver mine, in the year 1861, by Mr. Sargent, of the Vulcan Iron Works Co., and were 36 inches diameter, and made of 3-16 steel plate. After being used with a pressure of from 70 to 90 pounds of steam for three years, they, by accident were fired up without having any water in them, and before the fires were drawn the sheets were at a red heat. Yet, with this severe usage, they have, after being caulked up, again been used, and have continued in constant use, nearly night and day, up to the present time, and show a fair promise of lasting many years longer.

Since the times when those boilers were made, great improvements have been introduced in the manufacture of steel. Indeed, no branch so important in engineering or metallurgy has made such progress. From recent investigations, made in England to satisfy engineers how far steel plates could be relied upon, it was shown that plates could be made of any tensile strain, adapted

to special purposes, according to its hardness. So far, about thirty-five tons to the square inch is about the limit for steel boiler plate; though plates have been made to stand twice as much, but were too hard to stand punching. Even this, however, may be remedied by drilling, instead of punching the holes. But what is most astonishing, is that steel plates, capable of sustaining thirty-five tons to the square inch, and as thick as  $\frac{1}{4}$  and  $\frac{3}{8}$  of an inch, will bend when cold—flat, even—without cracking; which test few brands of soft boiler iron will stand.

The brand upon the steel sold by Nelson & Doble is sufficient guaranty of its quality, and we hope to hear soon of its extensive introduction in steam boilers. If ever we have the good fortune to have a boiler insurance company in San Francisco, (which would be another step in the right direction) we have no doubt that a steel boiler would be (as in England) insured at enough less rate to warrant the first increased outlay.

We are not prepared to give the comparative cost between steel and iron, though we do not think, when everything is taken into consideration, that there is much difference.

We propose at an early day to say more upon this boiler question, which is one of the greatest importance to California, and the Pacific Coast generally.

**IRON ROOFS.**—Iron is now being largely used, in many places, as a material for the construction of large roofs. Among the most noted instances of this class of construction, we may mention the following: The main arched roofs of the Dublin Exhibition Building—one of which is 218 feet long by 50 feet span, and the other 353 feet long by 50 feet span. The arched roof of the Derby Market Hill is 192 feet long by 86 feet span. The main roof of the London Crystal Palace is 120 feet span. The Amsterdam Crystal Palace is 329 feet long by 64 feet span. The largest single span is that now being built at St. Pancras Station, on the Midland Railway, England, which, when completed, will be 690 feet long, with a clear span of *two hundred and forty feet!* This roof will be a little wider than the roof of the Moscow Riding School, the largest single span heretofore constructed.

**USEFUL DATA.**—A cubic foot of water weighs 62 $\frac{1}{2}$  pounds, and contains 6 $\frac{1}{4}$  imperial gallons; hence one imperial gallon may be taken to weigh ten pounds.

A pipe one inch in diameter and one yard in length, contains 20.26 cubic inches, or nearly a pound of water; hence the following practical rule is generally used to find the quantity of water in a pipe of any given diameter:

Square the diameter of the pipe in inches, the result is the weight of water in pounds, per yard of the pipe's length; shift the decimal point one place to the left for the quantity of water in gallons per yard.

For practical purposes, water may be regarded as incompressible, inasmuch as when completely deprived of air and subjected to a pressure of 22 atmospheres, its bulk is reduced only to the extent of one 890th.

Water expands in bulk and decreases in density from a temperature of 39° F. up to 212°, when it boils and evaporates into steam. Below 39° it again expands and decreases in density down to 32°, when it crystallizes into ice. In assuming the form of ice the bulk is increased in proportion of 9 to 8, and the force with which it expands is so great that scarcely any thing can resist it.

**PROTECTION AGAINST LIGHTNING.**—It has been stated by an especial French scientific commission, that if a copper cylinder two centimeters in diameter, by twenty or twenty-five inches in length, be used instead of the ordinary gold, platinum or copper, on the top of lightning rods, there can be no danger from electricity, as the copper so used cannot melt on account of its great conducting power.

## Scientific Miscellany.

## Interesting Paper on Aluminum.

At the last meeting of the New York Lyceum of Natural History, Professor Henry Wurtz, well known as the discoverer of the peculiar value of sodium amalgam for amalgamating gold ores, read a very interesting paper on some newly discovered properties of the metal aluminum, an abstract of which we find in the *American Journal of Mining* as follows:

The author's numerous experiments upon metals with sodium amalgam have revealed to him new and surprising properties of aluminum, the most abundant metal (as he says) upon the earth; and promising to be the most valuable. These new phenomena, once discovered, may, however, be readily reproduced without the aid of sodium, and they were exhibited to the Lyceum by Prof. Wurtz, repeatedly, and in various forms. He first pointed out the wonderfully exceptional nature of aluminum, never found native, and so hard to detach from oxygen; yet, when detached, manifesting no more disposition to recombine therewith than gold. His new discoveries solve this paradox perfectly. He first proved that the surface of the metal is passive to quicksilver, as he has before shown in *native gold, iron, etc.*, but that, wholly contrary to common belief, the internal parts of a piece of aluminum *absorb pure quicksilver* with avidity; so that a piece of rolled sheet is thus quickly split into component laminae. The internal surfaces thus enfilmed with quicksilver, he then proved to possess most surprising new properties. On exposure to air, they at once *take fire spontaneously, and burn with evolution of heat*; a coating of hydrate of alumina, as a bulky, feathery or filamentary mass, being formed, with a growth so rapid as to be *visible to the eye*, and under the lens wonderful to behold. To condense the discoveries of Prof. Wurtz we give his new theory of aluminum, slightly altering the phraseology for the sake of brevity.

1. Normal aluminum is in the electro-negative or *passive* state, corresponding to "passive iron," for example.

2. Quicksilver induces an abnormal, *active* or electropositive state, precisely corresponding to normal sodium and potassium.

His experiments have shown, as he has maintained in a previous paper, that no amalgam of aluminum is formed; and this newly discovered absorption of quicksilver beneath the outer crust of the metal, he believes to be perfectly analogous to the phenomenon of Prof. Joseph Henry's celebrated lead syphon experiment, in which a solid amalgamated lead syphon conducted quicksilver indefinitely through its internal pores from an upper to a lower vessel. Prof. Wurtz's deductions from his own theory are of high interest and importance. For instance, he holds the idea, that we may confidently hope, as one of the results of investigations in this new field, to obtain a permanently passive form of iron; a discovery which, if ever made, will be surpassed in practical value by few others; and he asks, why we should not now regard as possible the discovery of sodium and potassium in their passive forms, corresponding to ordinary aluminum—in which case, these metals could be handled with impunity, and become articles of general commerce. Mr. W. announces that his paper will probably appear in full in the next number of the *American Journal of Science*.

**SULPHURIC ACID IN LIVING MOLUSCA.**

At the last meeting of the Academy of Sciences, M. Dumas communicated a curious note by which M. de Luca determined, in the liquid contained in a living molusca the presence of a thirtieth part, or about three per cent. of pure sulphuric acid; and stated furthermore, that the same molusca, plunged in water, disengages a considerable quantity of carbonic acid.

**A NEW LUBRICANT.**—From specimens of the Chinese tallow tree transplanted into Northern India, Dr. Jameson has made several hundred weight of grease, and has forwarded on trial a portion of it to the Punjab railway to have its qualities tested as a lubricant. The grease thus obtained forms an excellent tallow, and burns with a clear, brilliant, and white light, emitting no unpleasant odor or smoke.

**COPPER** deposited by galvanic action is rendered *tough*, according to M. Bouillet, if a mere trace of gelatine be added to the solution of sulphate used in its preparation.

**ORGANIC STRUCTURES FROM INORGANIC ELEMENTS.**—We have several times of late alluded to laboratory experiments, in which various organic structures have been produced from inorganic elements. The experiments of Berthelot for obtaining brandy from coal were detailed at some length in our issue of July 20th, 1867. Further experiments were detailed June 29th, 1867, in which the same distinguished chemist, assisted by Daubré, had succeeded in producing artificial combinations of carbon and hydrogen, devised from purely mineral substances, without the intervention of either animal or vegetable life. These same carbides of hydrogen, so formed, were also further built up by the addition of oxygen so as to form alcohol, oxalic acid, and other similar products composed of C, H and O. It may not be generally known that *artificial oil of bitter almonds* is now manufactured from ordinary benzene. The process is described as follows: A fine stream of benzene and another of smoking nitric acid, are allowed to run together in a worm kept cooled. The liquids react on each other on coming in contact, heat is disengaged, and the artificial oil collected at the end of the worm is first washed with water, then with a solution of carbonate of soda, and lastly, again with water.

**MUSHROOMS IN THE EAR.**—Dr. C. Robin, in a paper addressed to the French Academy of Sciences, described two new kinds of mushrooms of the *Aspergillus* genus, growing on the membrane of the tympanum. This parasitical vegetation he had observed in ten patients, four of whom had it in both ears; and in all cases it existed independently of any other morbid affection. Each of these auricular mushrooms presents the chief botanical characteristics of *aspergillus glaucus*, but they differ in the color of their organs of fructification. They form a pseudo membrane, covering that of the tympanum, so that if the former be extracted entire, it will be found to have the exact shape of the latter. Dr. Robin wished to see whether these aspergilli could exist elsewhere than on the human body; he therefore tried several kinds fruit, and found that they took to the lemon and orange very readily, but on the transfer they lost the color exhibited while on animal soil. The growth of these parasites in the human ear is an obstinate malady, for which Dr. Robin prescribes highly diluted solutions of hydrochloride of lime or of arsenite of potash, which at once destroys the cells of the aspergillus. Phenylie tannic acids do not destroy the cells, but mummify the pseudo-membrane in a remarkable manner.

**BLACK CURRANT LEAVES.**—The *Journal des Connaissances Medicales* contains an article on the virtues of the leaves of the black currant (*Ribes nigrum*). These leaves, when green, are much used by the country people for tea in cases of difficult digestion. With sugar, this beverage is agreeable, aromatic, and possessed of exciting properties. M. Blucher has distilled these leaves in the same way as those of peppermint, balm, etc., the operation being stopped when the liquid obtained is equal in weight to the substance employed. The leaves should be handled as little as possible, in order not to crush their odoriferous glands. This medicated water is a good vehicle for all stomachic potions, and will keep without change for two years.

**CHEMICAL OR MECHANICAL.**—Some rails of one of the New York city railroads were taken up a short time since, and on their lower surface was a perfect representation, or reproduction of the grain of the sleepers on which they rested, with all the knots and the curvatures of the wood, as neatly done as if by the painter's art. On applying the fingers to aid the sight, these lines were found to be really engraved or indented into the iron so much as to be readily detected by the sense of feeling. Whether produced by chemical action or by mechanical force is a question.

**FEELING SOUND.**—Dr. Peet has discovered a very curious fact—that deaf persons can feel a drum when beaten. They feel the reverberation as if striking the soles of their feet and passing up to the regions of the heart. He has made a curious application of the discovery, having an alphabet which he beats on the drum, and the mutes, with their backs turned, write the word spelled in that way.

## New Patents and Inventions.

Under this heading we shall mention, from week to week as occasion may demand, New and Important Inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent Issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

## PATENTS RECENTLY ISSUED.

70,724.—IMPROVEMENT IN WATCH ESCAPEMENT.—William H. Lamb, San Francisco, Cal.

I claim 1st, The construction of an escapement for time-pieces, in such a manner as to pass the teeth upon opposite sides of the balance staff, thereby giving an impulse on both the right and left vibration, substantially as herein described.

2d, Unlocking pin, *g*, from the teeth, *n*, of the escape wheel, by the liberating pin, *i*, on the balance-staff coming in contact with the end of the detent lever, *d*, substantially as described.

3d, The combination of the wheels D and E, operating on each side of the balance-shaft by means of the notched rollers, *b* and *c*, or their equivalent, and the liberating pin, *i*, operating on the detent-lever, *d*, and the pin, *g*, the whole operating as and for the purposes herein specified and described.

This invention relates to the escapements used for time-pieces, and its object is to provide an improvement of such a nature that an impulse is given to the balance-wheel at each vibration, by passing the teeth of the escape wheel on each side of the balance-shaft; it also consists in unlocking the teeth of the escape-wheel, by means of a pin on the balance-shaft coming in contact with the end of the detent-lever, the whole forming a perfectly free escapement. To effect the first, I attach two wheels to the same staff, one being much smaller and placed higher up than the other. The smaller one has its escape teeth on the outer circumference of the rim, while the larger one has them on the inner circumference. The staff of the balance-wheel passes up between these two sets of teeth, and carries two notched rollers, so constructed that the smaller wheel acts upon one side of one roller, on one vibration, while the other one acts upon the opposite side of the other roller for the reverse motion. A small pin, also attached to the balance-shaft, comes in contact with the end of a detent-lever at each vibration, and moves it back. This lever carries a pin, which is thus thrown out of contact with the detent teeth, on the outside of the larger wheel, thus allowing the wheel to rotate.

70,971.—IMPROVED LOAF-BREAD MACHINE. John D'Arcy, San Francisco, Cal. I claim the combination and arrangement of the kneading rollers, C, C', endless apron, *a*, carried by the rollers, D and D', and the rotating knife, F, all as set forth.

The design of this invention is to provide an improved machine for rolling and cutting dough into the desired size for loaf-bread, and consists in constructing a machine with rollers or cylinders placed transversely across a platform operated by toothed wheels. An endless belt or apron revolves beneath the rollers, and a revolving knife in front of the rollers cuts a portion of the dough into the desired size at every revolution, and the endless belt carries it to the end of the machine, from whence it is taken and folded in such a manner that the gases are retained until the dough is ready for the oven. A full description of this machine and process, with the advantages which it presents over the ordinary hand process, has already been given in our columns.

70,973.—IMPROVED BOTTLE WASHER.—Henry B. Davidson, San Francisco, Cal. I claim a hench or supports, provided with a series of holes, B, B, to hold the bottles, in combination with a series of jet pipes, D, D, extending into the nozzles of the bottles, and conducting water to wash them, substantially as described.

The design of this invention is to provide a box of any desirable shape, and of a size sufficient to accommodate any number of bottles. At the bottom of this box is a pipe, which is connected with the tank or source from which the water is derived; considerable pressure being necessary to render it effectual. A number of jet tubes is attached to the upper side of this pipe, and holes are made in the top of the box, corresponding with those tubes, into which the neck of the bottles are inserted, and the water then turned on. As fast the bottles are washed they are removed, and others take their places.

71,019.—IMPROVEMENT IN ESCAPEMENT FOR TIME-PIECES.—William C. Kellum, San Francisco, Cal.

I claim, in combination with the escape wheel, *o*, the arrangement of the detent-lever, H, springs, J and K, lock-lever, *n*, and adjusting screw, I, substantially as and for the purposes set forth.

The design of this invention is to provide an improvement in escapements used in time-pieces, and which consists, first, in attaching a return spring to the detent-lever by a pivot, in such a manner that the two may be kept in adjustment by one spring. The detent-lever may be locked upon the escape wheel by gravitation, when used in an upright or pendant time-piece. Also my return spring may be kept in its adjustment upon the point of the detent by gravitation, whether attached at any point of the detent by pivots, or to any other part of the time-piece. A lock lever is attached to the detent lever, so that in case more than one tooth passes at once, this lever will catch the escape-wheel, and force it to lock upon the detent-lever.

The invention also relates to an arrangement for banking, by which the balance-wheel is allowed to vibrate to a certain point in either direction, but not far enough to pass more than one tooth. This is affected, first, by means of a light spring, so placed that as the hair-spring uncoils, it forces it out so as to catch the banking-pin or the rim of the wheel; and secondly, by means of a lever, so placed as to be moved out and in by expansion and contraction of the hair-spring, and which shall catch the banking-pin at a certain point.

[We have at hand four other California patents, which reached us by yesterday's steamer, the titles of which are given elsewhere; but the usual notices of which are necessarily deferred till next week.

## RECENT INVENTIONS.

ANOTHER NEW PLOW.—The Stockton Independent says that Mr. Geo. H. Dahl, of that city, has constructed an improved plow, the advantages claimed for which are: First, the general design; second, the shape of the mold-board; third, the manner of attaching the mold-board; fourth, the land-side, and manner of attaching the same; fifth, a pivot-wheel; sixth, novel scrapers to keep the wheels clear of earth; seventh, the shape and strength of the standard. The gang consists of four ten-inch plows, which are longer than most others in use, and so set in the beam as to produce less resistance to the draught than those set more squarely to the land. The improvement has been thoroughly tested in different soils and found to work well in all cases.

NEW GATE HOOK.—Dr. F. G. Hearn and Dr. Wm. Bisbee, of Yreka, have invented a new spring hook and bolt, which the Journal of that place says will hook a door or gate, so as to render it impossible to be opened from the outside, and the spring of the hook is so arranged as to allow sufficient room for shrinkage. For steamboats, railroad cars, houses, stores, gates, etc., they are said to be superior to anything now in use, and will undoubtedly be in great demand when offered to the public.

IMPROVED DUMP CART.—Mr. Munger recently exhibited to the New York Institute, an improved dump cart or rather wagon, as it is placed upon four instead of two wheels. The main device consists of rollers on the forward and hind bolsters; hooks hold the wagon bed in place, but when unhooked, and the horse backs, the reach, having a hinge in the middle, rises, the wheels approach each other, and the wagon box is turned the same as a cart body. When the horse starts up the wagon returns to a natural position. The Committee of the Institute appointed to examine and report upon it, were decidedly of the opinion that it is a simple and important improvement, useful on any farm. The cost of such attachment is \$10.

GALVANISM IN ORGAN PLAYING.—By a recent invention galvanism and magnetism are made to do the work of opening and closing the valves in playing the organ, thus doing away with the necessity of a great physical exertion when "playing full organ."

STEEL RAILROAD IRON DIRECT FROM THE FURNACE.—Lorenzo Sibert, of Augusta county, Va., has recently devised a process for making steel railroad bars, and other steel, direct from a blast furnace, at comparatively little expense. If such a process is successful it is one of the most important discoveries of the age.

## TO INVENTORS

ON THE  
Pacific Coast.

Messrs. DEWEY & CO.

Take occasion to call your attention to the following rules, regulations and suggestions relative to the obtaining of LETTERS PATENT of the United States:

## Self-Evident Facts.

Having had large experience, and gratifying success with the great variety of cases emanating on this coast, we feel confident of our abilities to assist inventors in patenting their inventions, saving them from vexatious delays, and from receiving worthless papers by reason of imperfect preparation of their claims before being sent to the Patent Office.

The branch of Patent Law is of itself a SPECIALTY of legal jurisprudence; or, as Mr. Phillips, an eminent Patent lawyer, justly remarked: "The metaphysics of the law."

In early days but little preparation was needed, or but ordinary skill required to obtain a patent; but now, by reason of the multiplicity of inventions, and the numerous acts of Congress, found necessary to protect the inventor while the patent lasts, and to do justice to the people after it expires, the utmost care and skill are requisite in managing cases and obtaining a patent that will be of real value to the Patentee, and stand the test of passing through the legal ordeal of an infringement suit.

The general practice of the Patent office regarding the examination or issue of Letters Patent for inventions has not been materially changed for many years, yet there have been amendments added to the laws of 1861, 1863 and 1866, and which it is necessary for all parties managing an application to be conversant with. Old inventors invariably advise the employment of none but agents of responsibility and experience. As agents with such qualifications, we solicit your patronage.

## Advantages to Patrons of Our Agency.

Some of the advantages to be obtained by patronizing us, may be enumerated as follows:

1. Inventors on this Coast having their applications for patents made out through our agency can sign their papers at once, and thus secure their rights at least three months sooner than by trusting the same to distant agencies, situated at New York or Washington.

2. As many of the inventions conceived here are especially adapted to the Pacific Coast, they should be properly brought out here, which can be accomplished (if the invention is a meritorious one) by illustrating the subject, with a careful description, in the columns of the "Mining and Scientific Press," free of charge; the inventor paying simply for the engraving, which will be executed at a moderate charge. The same cuts can be subsequently used for books, letters, or circulars. In a word, we are determined to make it of decided interest for every inventor on this Coast to patronize home talent and enterprise.

3. Most inventions on this Coast are for objects and purposes but little understood by parties at Washington or other parts of the East. Our mining machinery, processes and operations are best understood by those familiar with their use; and a personal, verbal explanation is oftentimes of important service, and enables us to be more successful than agents generally.

4. Remittances of money made by individual inventors to the Government sometimes miscarry, and it has frequently happened that applicants have not only lost their money, but their inventions, also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency. By sending duplicate correspondence to our Washington agent we avoid hazardous delays.

## Confidential Advice.

Those who have made inventions and desire to consult with us respecting the same, are cordially invited to do so. We shall be happy to see them in person at our office, or to advise them by mail, or through the MINING AND SCIENTIFIC PRESS. In all cases they may expect from us an honest opinion. For these consultations, opinion and advice we make no charge. A pen-and-ink sketch and description of the invention should be sent together with a stamp for return postage. Write plain, do not use pencil or blue ink; be brief.

Remember all business committed to our care, and all consultations, are kept by us secret and strictly confidential. Our permanent business interests demand, as it were, a sacred compliance with our obligations as solicitors, and in reference to our strict fidelity in this respect we refer to one and all of the hundreds of inventors and patentees on this coast who have patronized us.

## Letters Patent.

A patent is an open letter, embodying all the language of an inventor or his agent, contained in the specification, without alteration, and is granted to citizens of the United States, or those who have declared their intention of becoming such, and is signed by the Secretary of the Interior and the Commissioner of Patents, with the seal of the Patent Office affixed. Its jurisdiction is for the whole United States, for the term of seventeen years.

A patent right is personal property, and is assignable, but cannot be seized and sold on execution.

## What Claims can be Patented?

A knowledge of Ancient and Modern Mechanics and familiarity with American and Foreign

patent issues and rejections, enables us to determine in a measure in all cases what can be patented, and how much can be claimed as new and novel, and be covered by Letters Patent. This is one of the most difficult questions encountered by both old and new inventors—one in which an experienced counsel is of great service—and yet it can never be positively determined except by presenting a formal application for a patent to the Government, embracing a petition, specification, model, duplicate drawings and payment of the first government fees.

## Caveats.

A caveat is a description of the invention designed to be patented, lodged in the Patent Office before the patent is applied for, and while the inventor is perfecting his design. When properly made, it operates as a bar to applications respecting the same invention from any other quarter; but when improperly done, it is inoperative by reason of such defect. The Patent Office always returns a receipt for caveat papers with a copy of the laws governing the same, but does not seek to point out its incorrectness, unless there be some glaring defect. If worth filing at all, these cases should be prepared with very great care and caution.

One inventor on this Coast, who had filed a caveat by an attorney, was, sometime afterward, surprised to find that his invention, which was a very important one, had been patented and was being brought out by an eastern company with a capital of more than a million of dollars. Upon inquiring at the Patent Office, he was informed that his caveat was inoperative by reason of imperfections and his not having complied with the law in that case as made and provided.

Our fee for the service varies from \$10 to \$20. The Government fee, under the new law, is reduced to ten dollars. This latter sum does not now apply, as heretofore, as part of the fee on presenting an application for a patent.

Inventors will oftentimes find it very important to take advantage of the caveat system—the expense under the law being comparatively small.

To enable us to prepare caveat papers, we only require a sketch and description of the invention; no model being necessary.

If an inventor publicly uses and sells his invention, prior to making application for a patent, he cannot, afterward, prevent others from doing the same thing; and should any party put the invention into use, before such application for a patent is made, they could continue to use the specific machine or composition of matter after the patent is issued to another. Filing a caveat does not give the right to affix the words, "Patented," or "Patent applied for."

## Re-issues.

When, through "inadvertence, accident, or mis take," an insufficient or defective patent has been issued, the defects in the Specification and Claims can be cured by a re-issue. In order to obtain this, the inventor, or the holders of the patent, must surrender the patent, and file an amended specification and drawings, and a statement specifying the ground for asking for a re-issue. Re-issues are generally applied for after it has been found that the patent could not withstand litigation. It is, therefore, especially desirable that the new Specification and Claims should be prepared with great care and skill. Terms liberal in these cases.

## Expense of Applying for Patent.

The Government fee, on filing an application for a patent in the United States, is fifteen dollars; and if the patent is allowed, twenty dollars additional is required. If rejected, the first fee of fifteen dollars is all that is demanded. English, French, Austrian, Prussian, Spanish, and inventors of every nationality, may now obtain patents in the United States upon the same terms as our citizens. The only discrimination made is against subjects of governments that discriminate against the inhabitants of the United States.

To the foregoing official fees must be added fees for preparing the various documents and expense of drawings. Our charge for preparing a case, presenting it to the Government, and attending to all business connected with it, varies from \$20 to \$40.

Following is the list of Government fees:

On every caveat.....	\$10
On every application for a patent, for seventeen years.....	15
On every application for a design, for 3 yrs and 6 mos.....	10
On every application for a design, for seven years.....	15
On every application for a design, for fourteen years.....	30
On issuing each original patent.....	20
On filing a disclaimer.....	10
On every application for a re-issue.....	50
On every additional patent granted on a re-issue.....	30
On every application for an extension.....	50
On the grant of every extension.....	50
On appeal to the Examiners-in-Chief.....	10
On appeal to the Commissioner from Examiners-in-Chief.....	20
On every appeal to the Judges of Circuit Court, D. C.....	25

## Illustrate your Inventions!

Too many ingenious inventors lose the value of their genius and labor by not bringing their improvements conspicuously or plainly enough before the public—the general reading public.

One of the best means—and the cheapest, too—for eliciting attention to a new invention, is that of illustrating and describing it in the columns of the Mining and Scientific Press. To do this in the case of a meritorious improvement (and none other will be accepted), will cost our patrons no more than the price of a first class engraving.

With a cheap representation we will have nothing to do, as it would be calculated to injure both the inventor and ourselves.

We also take especial pains in furnishing engravings and electrotypes of superior merit, of all kinds, at fair rates, and tender our patrons the benefit of our practice and experience, by advice and assistance in getting up their circulars, advertisements, etc.

DEWEY & CO.,

Patent Solicitors, Mining and Scientific Press Office,  
505 Clay Street, San Francisco.

Weekly Stock Circular.

Of Associated Brokers of the S. F. Stock and Exchange Board.

SAN FRANCISCO, SATURDAY MORNING, December 14, 1887.

City Stocks.

City Stocks, for the most part, are well maintained. California Steam Navigation is in the market at an advance, selling at 80 1/2 @ 81 per cent; the usual monthly dividend will be disbursed on Monday, the 16th instant.

The Bank of California has declared the usual monthly dividend of one per cent, amounting to \$50,000, payable on and after Monday next.

We give below the Marine Premiums received by seven different local Insurance Companies for the two last quarters, ending July 31, and October 31, 1887, to wit:

Table of Marine Premiums for various companies like Pacific, National, Merchants, Union, California, Home Mutual, and Fireman's Fund.

Mining Share Market.

The mining share market has been quite active and firm during the past week, obtaining increased activity at the close, owing to the somewhat rapid advance of several prominent claims, and on this account the stock arena is more excited than usual.

The assessments of Comstock claims have been quite large during the present month, and compare as follows with the dividends:

Table comparing Dividends and Assessments for various mines like Savage, Kentucky, Gold Hill Quartz, Chollar-Potosi, etc.

SAVAGE—has been well maintained under greatly increased sales, opening at \$110 75, improving to \$111 50 ex-dividend of \$7 50 per share, receding to \$104, then selling at \$110, and closing at \$109.

CHOLLAR-POTOSI—has been sold to a large extent, over 3,000 shares changing hands at improved rates, rising from \$55 to \$69, falling to \$50, improving to \$65, and closing at \$62.

IMPERIAL—has been less active than last week, declining from \$169 to \$158, advancing to \$167, and closing yesterday at \$169.

principal portion coming from the incline of the 154 level, and is said to yield an increased percentage of gold. The 210 level does not look so promising as formerly.

HALE & NORCROSS—was inquired for at the close, advancing to \$1050, and closing at \$1000, seller 60. Owing to the heavy expense of raising ore from the winzes, work was stopped in them on the 10th instant.

YELLOW JACKET—declined from \$490 to \$475, rapidly rose to \$600, and closed at \$615. We are informed that the drift from the 750 level toward the Kentuck line "struck" it handsomely.

KENTUCK—is in good request, and during the past week sold at \$175 @ 165, then rapidly rose to \$200, and closed at \$183.

Considering all difficulties encountered, these shipments are remarkable, and the amount received from the eastern mines is refreshing, evincing the richness of their ledges.

CHOLLAR-POTOSI—rose to \$135 seller 3, then sold at \$122 @ 128, and closed yesterday at \$130. We have no material change to note in the condition of the mine since our previous report.

CROWN POINT—advanced from \$630 to \$605 under limited sales, and closed at \$670. We have nothing of especial interest from this mine. In the north drift, 700 level, ore is found eight feet wide, and sixty-one feet below the 600 level the ground is opening well, showing some good ore.

EMPIRE—was in the market at \$165. The receipts of bullion in November aggregate \$18,763 78, against \$20,579 48 in October. This decrease is owing to the stoppage of the mill for some time early in November.

OVERMAN—has been sold to a large extent, over 3,000 shares changing hands at improved rates, rising from \$55 to \$69, falling to \$50, improving to \$65, and closing at \$62.

OPHIR—was in the market at \$115. Annual meeting at Virginia on the 16th instant.

SIERRA NEVADA—sold at \$3 @ 4 50. An assessment of \$4 per share was levied on the 11th instant.

The aggregate sales of Stocks, Legal Tender Notes, etc., at the regular sessions of the Board since Saturday last, amounted to \$1,025,355. The sales in the open sessions amounted to \$250,834, showing a combined aggregate to date during the past week of \$1,276,189.

MINING SHAREHOLDERS' DIRECTORY.

(Compiled for every issue, from advertisements in the MINING AND SCIENTIFIC PRESS and other San Francisco Journals.)

Comprising the Names of Pompano, District or County of Location; Amount and date of Assessment; Date of Meeting; Day of Delinquent Sale; and Amount and Time of Payment of Dividends.

Large table listing mining shareholders with columns for Name, Location, Amount, Day, and Date of Assessment.

\* Those marked with an asterisk (\*) are advertised in this journal.

Latest Stock Prices Bid and Asked.

Table of stock prices for various companies like United States, California State, San Francisco City, etc.

GAS COMPANIES.

Table of gas companies like San Francisco Gas Co., Sacramento Gas Co.

RAILROADS.

Table of railroads like Sacramento Valley Railroad, San Francisco and San Jose Railroad, etc.

BANKING INSTITUTIONS.

Table of banking institutions like California Loan and Savings Society, etc.

INSURANCE COMPANIES.

Table of insurance companies like Fireman's Fund Insurance Co., Pacific Insurance Co., etc.

MINING STOCKS—WASHOE DISTRICT.

Table of mining stocks in the Washoe district like Alpha, Baltimore American, Bolcher, etc.

San Francisco Market Rates.

Table of market rates for various commodities like Flour, Corn Meal, Oats, Barley, etc.

GROCERIES, ETC.

Table of grocery prices for items like Sugar, Coffee, Tea, etc.

Retail Prices.

Table of retail prices for items like Butter, Cheese, Eggs, etc.

San Francisco Metal Market.

PRICES FOR INVOICES.

Jobbing prices rule from ten to fifteen per cent. higher than the following quotations.

Table of metal market prices for items like Iron, Steel, Copper, etc.

ESTABLISHED [MAR, 1860.]

VOLUME SIXTEEN

Mining and Scientific Press,

COMMENCING JANUARY, 1868.

DEWEY & CO., Publishers.

Issued every SATURDAY, at our Book and Job Printing Office, 505 Clay street, corner of Sansome, SAN FRANCISCO.

DEWEY & CO., Proprietors.

Mining and Scientific Press Patent Agency, Newspaper, Book and Job Printing Office, 505 Clay street, San Francisco.

MINING AND SCIENTIFIC PRESS.

Terms of Advertising and Subscription.

Miscellaneous Advertisements. One month, per square, five cents; three months, per square, 15 cents; six months, per square, 30 cents.

Mining Advertisements.

Notices of Meetings, per square, three weeks, \$3 50; five copies, one year, in all, in advance, 6 00.

Terms of Subscription.

One copy, one year, by mail, in advance, \$5 00; one copy, six months, by mail, in advance, 3 00.

THE CIRCULATION OF THE PRESS, already extensive, is rapidly increasing, and substantial traders who can profit by widely disseminating information of their business among the most intelligent industrial and commercial classes of the Pacific States and Territories will find no more effective or economical medium.

DEWEY & CO., Proprietors.

Patent Agency and Job Printing Office, 505 Clay street, San Francisco. (Name) July 1, 1868.

American and Foreign Patents.—Letters Patent

for Inventions can be secured in the United States and foreign countries through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts.

## Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

OWING to the non-appearance of our exchanges, caused perhaps by the non-arrival of the mails, our Mining Summary this week is not so voluminous as usual.

## CALIFORNIA.

## Alpine County.

*Miner*, Nov. 30th: The Morning Star mine is again turning out black ore as of old. We have seen as fine ore this week as any taken out in the palmiest days of the old strike.

Orders have been received to start up on the old Alpine tunnel.

In the stomach of a cow, killed at Silver Mountain lately, was found gold dust to the value of over \$10, after panning out. The cow has run for the last two years on Wolf Creek.

## Amador County.

*Ledger*, Dec. 7th; Last Monday Coney & Bigelow sent to San Francisco a gold brick, the product of 50 days' run of their chlorination works, weighing 418 ozs.; fineness, 994; value, \$20.54 per ounce, the whole amounting to \$8,588.15.

The Tubbs mill is crushing rock from the Kennedy mine. A good clean up is anticipated.

The Oneida mine is supplying more ore than their 40 stamps can crush. They will add 20 additional stamps and another boiler to the mill.

The ore in the shaft of the Union mine is as good if not better than any found above.

The new steam hoisting works at the Coney & Bigelow mine is now in operation, and works admirably.

The chlorination works are now running on sulphurets from the Keystone mill, at Amador City.

## Butte County.

*Oroville Record*, Dec. 7th: The machinery for a quartz mill at Swedes Flat, came up on Monday. It is for the Merrimac Co., who are erecting a 15-stamp mill. The engine is from the Golden State Iron Works, San Francisco.

A 40-stamp mill is in process of construction near Forbestown.

## Calaveras County.

*Chronicle*, Dec. 7th: Paul & Co., near the Junction, are working their claim with profit. At present they are taking out pay dirt.

Prindle & Bowman are working their claim in Chili Gulch night and day.

Albright & Co., Allen & Co., Bracket & Co., Dicare & Co., and many others in that vicinity are doing well.

Mr. M. Shaw has commenced operations on the hydraulic plan on his claim, and will soon wash a gap through Stockton ridge.

We were shown, this week, by Dr. Hepburn, some quartz which assayed \$700 per ton. The location of the mine is a secret as yet. A few pounds have been sent to San Francisco to be carefully assayed.

Staples & Co. have some 20 men at work clearing off the ground and making preparations for the erection of their mill in Rich Gulch.

The ditch of the Water Co. is completed to the new diggings near Camanche.

Hepburn & Co's mill, at Railroad Flat, is employed crushing more rock from the Petticoat lead. The last quartz taken from that claim paid \$50 per ton.

San Andreas Register, Dec. 7th: At Rich Gulch Alexander, Seavers & Co. the past season, have realized enough from their lode to pay for their 10-stamp water mill and \$6,000 beside. Mr. Staples, a capitalist from San Francisco, is now making arrangements for the erection of a mill on his lode, in the same locality. A company will also erect a mill on the Lamphear & Co. lode, early in the spring.

Most of the laborers on the Union copper mine have been discharged. The company have 400 tons of first class ore out awaiting shipment. Work will not be resumed until spring.

## Inyo County.

*Los Angeles News*, Dec. 3d: The silver mines near Lone Pine, on Owens river, are turning out silver in large quantities. In another place in this paper will be found an interesting letter from this county.

## Mendocino County.

The Mendocino Democrat says that a silver ledge has been discovered on Eel river in that county, and a company has been organized to work it. Some croppings, sent to San Francisco for assay, made a return of \$16.58 to the ton.

## Mono County.

The Dutch Flat Enquirer says that the

Dozier Co. have chosen Benton, Mono county, Cal., as a field of operation, where they have erected three furnaces. The Secretary has already received a test brick weighing six pounds. A letter from this district will also be found in another column of to-day's issue.

## Nevada County.

*Grass Valley National*, Dec. 4th: The owners of the Chippis quartz ledge are putting up an 8-stamp mill, having ascertained that their rock pays remarkably well.

A man named Henry Beckman while out prospecting lately, broke off a piece of float quartz, and extracted from it \$12.

Dec. 5th: We take from the certificate the following return of an assay of a sample of sulphurets from the Dromedary mine, made in San Francisco. The sample is found to contain \$13.42, in silver, and \$364.12 to the ton in gold, total \$377.54.

Dec. 7th: The works of the Nevada mine on Deer Creek, have recently been put in thorough order. The dam has been strengthened and the mill overhauled. The tunnels have been put in order, and a body of ore struck which is equal to any ever taken from the mine.

Teams are briskly employed in hauling float quartz from off the slide to the Gold Hill mill for crushing.

Dec. 9th: Arrangements have been made by which the employes and creditors of the Jim Co. have taken the mill and mine for payment of their claims.

*Transcript*, Dec. 4th: Several sets of gravel diggings have already started washing at Scott's Flat, and one or two more companies will soon be at work. The washings have so far been first rate, and there is a prospect that all the claims in this locality will yield large returns during this season.

*Gazette*, Dec. 4th: Work has been resumed on the Inkerman ledge, on Weimar Hill, near the French lead, by A. Powuing & Co. They are now down 65 ft., and the prospects are flattering.

Dec. 11th: The late rains have caused an extraordinary rise in the South Yuba. Information was received yesterday afternoon at the office of the Canal Co., that three boxes of the flume at the dam had been carried away, and the man in charge writes that the river is higher than it has been since the winter of 1861-62.

**EXCELSIOR.**—The snow is now about a foot in depth, with the prospect of more, and work on many of the claims has ceased. Operations are still carried on in a number of claims, among which are the Enterprise, U. S. Grant, Mohawk and Montreal, Excelsior, and a few others; but the gold production is not sufficient to support the population and many of the residents will leave to spend the winter in a more genial climate, with the intention of returning in the spring. The publication of the Meadow Lake *Sum* has been suspended.

## Plumas County.

*Quincy National*, Nov. 30th: A correspondent from Cherokee, gives the following items:

The Indian Valley Co. have struck it big in their lower level—ledge 18 ft. in width, all pay rock.

Judkins & Kellogg's ledge having been drained looks better than ever before.

The Caledonia mine continues to pay largely. Two mills are kept running on \$12 to \$15 rock.

*Quincy Union*, Nov. 30th: The new mill of Keating & Co., in the North Arm of Indian Valley, is being built more for the purpose of working silver bearing rock than gold. The ledge contains considerable gold bearing quartz also.

A ledge has been struck in the Mohawk ledge, and a well defined vein with excellent quartz found.

*Chico Courier*, Nov. 23d: Mr. Bidwell is in town with nine pounds retorted bullion taken from the Caledonia ledge in Plumas county.

## Sierra County.

*Downsville Messenger*, Dec. 7th: The Sawpit Flat correspondent gives the following items:

The Eagle Co. are breasting out good dirt. The Union is also taking out pay dirt.

The Buckeye claims are paying well. One-sixth interest sold lately for \$3,000.

The American and Union Cos. at Washington Hill, are doing well.

Mr. Hagan has purchased the old Franklin ditch and thoroughly repaired the same.

The Forest City correspondent says: The Adella Co. at Rock Creek, have lately struck rich pay in their main tunnel. Persons who have been into the diggings within a week and prospected them inform me that they obtained from \$1 to \$3 to each pan of dirt.

The Brush Creek quartz mine near the Mountain House, looks as promising as

ever. The deeper they go the better looks the rock and the mine.

## Sierra County.

*Yreka Union*, Nov. 30th: Wm. Smith, of Cottonwood, lately cleaned up, for a little more than a half a days' work, \$2,250. The claim is known as the "Hundred Feet."

## Tulare County.

*Visalia Delta*, Dec. 4th: At Kernville, the Cochran Bros. have built and put in operation a new quartz mill of eight stamps. They have rich rock. The Staples will soon have up another mill on their lodes in the same district.

## Yuba County.

*Marysville Appeal*, Dec. 8th: On many of the Yuba bars work has been resumed. At Long Bar No. 2 the Long Bar Co. have erected, set wheels and made other preparations to continue operations during the present propitious weather. Work has also been resumed to some extent on Slate Range Bar, in the head of the river, where moderately fair remuneration is being obtained. At Castle Bar considerable has been done the past season.

The Brown's Valley correspondent writes: The Rattlesnake Co. are still taking out very rich quartz, and their improvements are rapidly advancing in all directions. They intend to have their 10-stamp mill ready within a week. The prospects of the Dannebrog are very flattering—meanwhile their mill is partly supplied with quartz from the Rattlesnake mine. The Jefferson seems to advance slowly.

The Pennsylvania Co. have run a lot of tailings, formerly considered worthless, through one of Wheeler & Randal's grinding pans, and cleaned up 84 ozs. of amalgam, worth \$5 per oz.

## ARIZONA.

*Miner*, Nov. 23d: Last week, the Vulture Co. struck a pocket, out of which they took a small lot of rock, which contained over \$2,000 worth of gold. Smith & Wickenburg were getting ready to work. They are fixing up Henry Wickenburg's 5-stamp mill, have sent teams and men to the mine, and expect soon to turn out bullion.

## COLORADO.

*Georgetown Miner*, Nov. 21st: The following is a report of the tests made on ore from the W. B. Astor lode, in addition to the \$1,146 68 extracted by Garrott, Martine & Co.:

Six lbs. of ore, tested for A. D. Cooper, gave 24 ozs., silver, 998 fine, value \$32.40.

Six lbs. tested for J. A. Fisher, gave 24 ozs. silver, 998 fine, value \$32.40.

Six lbs. tested for A. T. M. Adams, gave 9 1/2 ozs., 998 fine, value \$12.82 1/2.

Eighteen lbs. gave 57 1/2 ozs., 998 fine, value \$77.62 1/2.

## IDAHO.

*Owyhee Avalanche*, Nov. 30th: Meek has finished his contract on the Poorman. The ledge is widening, and the ore about as rich as ever.

The Lincoln mill has started up on ore from the Ida Elmore and will continue on that ore during the winter. About twenty tons per day are being crushed.

The Iowa mill in Flint district, is constantly at work, and Black's mill will be started in a day or two.

We were this week shown a piece of ore, weighing about 60 pounds, from the Golden Chariot mine. Gold was visible every where on its surface, and a streak, about 1 1/2 in. wide, apparently nearly half gold extended entirely through the mass.

## MONTANA.

*Post*, Nov. 23d: The new 10-stamp mill of the Lost Lake Co., in the New York Gulch, started up one day last week. The mill crushes at the rate of 15 tons of rock per day. It is now crushing ore from the Little Giant lode, and on Saturday last, after a run of two days, the plates looked remarkably well and bid fair to make a good return for the first run.

There is a silver brick in the National Bank, the result of ore from the Poorman and other leads. The ore was crushed in a common arastra, without quicksilver, and yielded at the rate of \$75 per ton.

No mining of consequence is now going on at French Bar.

Turnley's mill cleaned up last week \$1,900 from 75 tons of ore out of the Park lode, Grizzly Gulch. The returns which have recently been made from this lode, represent it as one of the richest lodes in that section.

## NEVADA.

## Esmeralda.

*Union*, Nov. 30th: The ore in the Juniata mine are looking well. The mill is kept constantly running, crushing 22 tons every 24 hours.

The workmen in the Diana mine, at Hot Springs, cut the ledge on the lower level,

and found the ore richer than ever, several days since.

Mining matters at Walker's River and Pine Grove are extraordinarily quiet. At Washington but few people remain.

Mr. Tom Preece has the machinery on the ground for a mill, which will be erected immediately in Washington Dist.

## Humboldt.

*Unionville Register*, Nov. 30th: The Pioneer mill has been undergoing extensive repairs for some time.

The rock taken from the Monroe Series mine is now sent to Holt's mill, Winnemucca. The company intend to erect a steam mill at Dun Glen, with a capacity for crushing 20 tons daily.

*Virginia Enterprise*, Dec. 4th: Several large thoroughbred wagons are being loaded with machinery at the Clipper Gap hay-yard for the Humboldt mines.

## Pahranaagat.

*Reese River Reveille*, Nov. 30th: Day is breaking in Pahranaagat Dist. A better condition of things exists at present than at any previous period.

Companies are working on Peter's Hill and Silver Hill, on both of which there are many claims.

The Indiana ledge is producing chloride ore of a superior quality. The Crescent Co. is working a claim on the List ledge.

## Reese River.

*Reveille*, Nov. 30th: Wells, Fargo & Co. shipped from this city during the month of November 277 bars of bullion, weighing 19,672 pounds, and valued at \$298,762 11.

The Manhattan Co. shipped during the month of Nov. \$105,583.10.

Dec. 2d: During the month of Nov. there were shipped through Wells, Fargo & Co., by the First National Bank, \$89,039.10; and by John A. Paxton & Co., \$47,500.

On Saturday evening five bars of bullion, valued at \$6,399 52, were received in the city from the Knickerhocker mill, near Iona.

Dec. 3d: It is estimated that the ore produced by the Superior ledge, New Pass Dist., will yield from \$15 to \$20 per ton. The ore has been tested repeatedly by both crushing in mortars and mills, and the yield justify the estimate.

Dec. 4th: Keyser & Co., in Morey Dist. are pushing work on their claims with the most encouraging prospects.

The Belmont stage, last evening, brought 4,000 ozs. of bullion produced by the mill of the Old Dominou Co. at Hot Creek.

## Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

*Virginia Enterprise*, Dec. 3d: Three or four leads are now being worked in Palmyra Dist. and the prospects obtained in some of them are good. A lot of four tons recently reduced at the Eagle mills, Dayton, yielded \$40 per ton, while another lot of 10 tons went over \$20. Fifty tons are now being worked, and promise to yield a handsome profit.

Dec. 4th: The Occidental mine is paying as handsomely as ever. There was yesterday at the assay office of Van Wyck & Co., three bricks from the mine, weighing 3,320 ozs., valued at \$5,710.45, 995-1,000ths fine, the result of eight days working of a 15-stamp mill.

The Lady Bryan Co. are working ores of their mine in the DeLand mill, and find the croppings to yield from \$29 to \$30 per ton. They have 150,000 tons of the same kind of ore.

Dec. 5th: The Gould & Curry mill shut down yesterday on account of the scarcity of ore.

Dec. 7th: Wells, Fargo & Co. shipped from their offices in this city and Gold Hill, during the past week, 7,115 lbs. of bullion, valued at \$203,643.64.

## UTAH.

*Salt Lake Vedette*, Nov. 30th: It is rumored that rich placer diggings have been recently discovered on Ham's Fork.

*Gold Hill News*, Dec. 3d: At Wells, Fargo & Co's express office, Virginia, can be seen one of the largest and richest pieces of gold bearing quartz ever witnessed in this section. It weighs 50 lbs., and is estimated to contain over \$300 in free gold. It is from Sweetwater Dist., Utah.

## OREGON.

A gentleman, says the Umatilla Press, recently from John Day's river mines, says the Texas Bar diggings are paying better than ever. Two ditches are completed, one from Desolation Creek, and the other from the North Fork. In one run of 10 days, Sneed's Co. took out per man an average of \$6.38 per day. Companies on the opposite side of the river have taken out about the same. The miners expect to work most of the winter.

Communications.

In this Department we invite the frank suggestion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

Notes of Travel.

[Continued from page 355.]

BENTON.

Benton is 110 miles from Carson City, 45 miles from Aurora, and has an altitude of about 6,500 feet, being nearly 2,000 feet less than that of Aurora, which is said to have the highest altitude of any city on the continent.

The Hot Springs, having a temperature approaching the boiling point, bubble up on the west side of the valley, at the point of its greatest width, and where the promiscuous conglomerate of sand and volcanic debris, filling up an extinct crater, overlies the granite wall flanking it on the west. At several points along this line of conglomerate and primitive rock, warm water oozes out. The springs send forth a volume of about 150 inches (miners' measure) which, after flowing two miles or more, with diminishing temperature, disappears in the sand. The valley proper is two miles in width by four in length. But to the north and south extends a wide sand plain. In the midst of this plain rises a low mountain range to the height of 500 feet, and extends twelve or fourteen miles in length, running parallel with and along the base of the White Mountains. The latter run in a northerly direction, at a point nearly due east, and rise to the height of over 12,000 feet. These mountains are a spur of the Sierra, taking this name without doubt from the white color of the feldspathic rocks of which they are largely composed. On the low range, as also at points along the western and eastern base of the White Mountains, are found very rich mineral veins.

MINES.

Owing to scarcity of water, difficulties of temperature, and in gaining altitude; the White Mountains have not been prospected; indeed have been ascended by only one party (State Geological).

On the low range—easily accessible—are situated the Camanche, Diana, Cornucopia, Rockingham, Kearsarge, Eureka and other mines. From the Cornucopia and Rockingham, considerable quantities of ore have been subjected to a very imperfect reduction, or smelting process, by which only from thirty to fifty per cent. of their silver and gold has been obtained, with the entire loss of their copper and antimony. From all of them except the Eureka, the first quality of their ore yielding, it is believed, when properly worked, from \$500 to \$1,000 per ton, in gold and silver, have been freighted 275 miles overland, to tide water, and shipped to Swansea for reduction, with very meagre returns to the owners of the mines, but sufficient to enable them to continue their operations.

Of the ores of but one mine, the Diana, has a persistent effort been made to work them by the ordinary mill process. The owners, Messrs. Williams and Wickland, in June, '65, erected a 4-stamp mill, (230-pound stamps), with two of Wakoley's pans. They crush second and third quality of ore; that class of ore having less copper, and working better by mill process. They inform me this ore yields \$70 per ton, which is sustained by the fact that they came here empty handed, as part owners of the Diana, and are now sole owners.

The rocks in which this group of mineral-bearing veins occur, are igneous and metamorphic. The line of the vein is nearly due north and south with the line of stratification. On the west is granite, approaching syenite in character, followed by chloritic rock of fine granular texture, olive green, which is succeeded by chloritic chert, greyish white, soft, forming the foot wall lining of the vein. On the east is porphyritic granite—continuous to these rock on both sides of the vein are heavy luses or strata of lamellar, feldspathic rock; some talc and hornblende also occur. But the rocks most abundant in the upheaval are granite and feldspar. The veins dip to the east. The Camanche 70°, its inclination being 30° from a perpendicular; the Kearsarge has a dip of nearly 90°, descending

nearly perpendicularly. Others vary more or less from these.

The ores most abundant are antimonial silver, sulphuret of silver, chlorido of silver; antimonial sulphuret of silver also occurs.

Native silver not infrequently appears in dendritic or arborescent forms, also in more solid auriferous shapes. The ores also abound in green and blue carbonate of copper. Galena and zinc blende occur, the former in some cases in considerable quantities.

As these ores have never been worked with a view of saving the copper and antimony, it is not known what per cent. of those metals they carry, nor has it been only remotely determined what per cent. of silver they carry; as a large per cent. of the chlorido of silver is lost by the assay process.

The mines most extensively developed are the Cornucopia, Camanche, Diana, Rockingham and Kearsarge. These, however, are but partially developed.

There is one uniform peculiarity or feature connected with this group of veins, viz., the difference in the quality of the ore taken across the vein at any given point. There is a line or stratum ranging from six to eighteen inches in width—the width differing more or less in the same mine—that will yield, it is believed, when properly worked, from \$500 to \$1,500 per ton. Next, a quantity of ore adhering to and laying alongside this stratum, that when properly worked will yield \$100 per ton and over. There is a large amount of third quality of ore of the approximate value of which no result has been obtained.

A further description of these mines until for the present be deferred.

THE DOZIER'S METALLURGIC CO.

The most interesting point of observation at Benton, is the works of the Dozier Metallurgic Company. They are nearly completed, and will very soon be put in operation.

Discarding the mechanical mill process for reducing silver ores to an impalpable powder, and then collecting their precious particles by the agency of quicksilver; also discarding the European and Mexican tedious imperfect process by smelting—Dr. Dozier effects easily and at once by the laws or forces of chemical analysis and combination, aided by the agency of heat, a nearly complete separation of the baser metals—antimony, copper and other metals—from the precious metals of gold and silver. As a demonstration will soon be made, when it is expected the works will themselves report as to the success and completeness of the process. Further description of the works, or explanation of the process would seem at present to be uncalled for.

[Written for the Mining and Scientific Press.]

Cement Mining in Sierra County.

EDITORS MINING AND SCIENTIFIC PRESS:—Some eighteen months since a party of six or eight men in San Francisco, jointly purchased a claim at this place, formerly known as the Extension Claim, incorporated a company under the name of THE ADELLA GOLD MINING COMPANY, and forthwith commenced active operations. But before alluding to progress made by the present company, a brief account of its past history may not be amiss.

It was located in early days on the Blue Lead, adjoining on the north the Forest claim, long noted for its richness, and bounded on the east by the Oregon and Live Yankee claims, two of the best gravel mines in the State—the latter, as I am credibly informed, having paid monthly dividends of from ten to twelve thousand dollars to the interest for several years in succession. It was, during that time, owned by twenty-five members, with one hundred feet each.

After the expenditure of large sums in the prosecution of the work on the Adella Company's claim, and owing to inability, pecuniarily, to carry it further, it passed, before the lead was reached, however, into the hands of Messrs. Slidell & Preston, of Marysville, from whom the present company derive title. The new company have expended some \$15,000—much of which has been lost by a species of false economy, (too often witnessed in our mines,) for the want of a competent engineer to manage the machinery. But their perseverance seems now about to be rewarded, as they have finally struck the lead, which, as far as prospected, is similar in every respect to that of the adjoining claims, of which mention has been

made, and fully meets the expectations of the most sanguine of the company. A tunnel has been run across the lead, a distance of two hundred and fifty feet, through an excellent quality of gravel, reaching the east rim or bench, where it prospects even better than in the main channel.

I had the pleasure of seeing a number of pans washed from this portion of the claim, which yielded from one to three dollars to the pan. On inquiring of the miners present if much of the ground was likely to pay in the same ratio, one of them replied, that there was enough already prospected to afford work to fifty men for the next five years, while another asserted that the claim, with all the force the company might choose to employ, could not be worked out in fifty years. The company are only waiting for a few days for some necessary repairs to be made in the machinery, before they begin the work of breasting out with a large number of men. So much for the history, the progress and prospects of this claim, which we trust you will publish for the information and encouragement of mining stockholders, generally. D. O. S.

Rivot's Process.—It is known to many of our readers that ineffectual attempts have been made on this coast, both in Nevada City, in this State, and in Virginia City, to work Rivot's process for extracting gold and silver from sulphurets by the use of superheated steam. We understand that a gentleman who has been carefully instructed in this process by Rivot himself, has lately arrived with the intention of giving the process a new start here. He brings a model of the furnace to be constructed, with plans and specifications, and as we understand, asserts, as also does Mr. Rivot himself, that by this process it is possible to work our ores and tailings *thirty per cent. above their assay value.* Of course this assertion implies that our assayers do not reach the full value of our ores by their laboratory work. The value of this assertion may be estimated when it is stated that all assayers are in the habit of *proving* their work by placing known quantities of metals in non-metalliferous rocks, and proceeding, in the usual way to recover it. New processmen would be much more likely to succeed in securing the confidence of the mining public on this coast, if they would confine their pretensions more closely to facts, and let their *work* precede their *assertions.*

ALABASTER.—Immense beds of pure alabaster have recently been discovered in the vicinity of the great rock salt deposit of St. Domingo. This variety of gypsum is a hydrated sulphate of lime, with two atoms of water. It is largely used as a coating for walls and ceilings. The article recently obtained as above, at St. Domingo, has been pronounced by builders in New York to be of a very superior quality.

COAL MINE EXPLOSION AND LOSS OF LIFE. The Pine Ridge colliery, two miles north of Wilkesbarre, Peuu., has been closed for several days to smother and quench the fire-damp. A recent attempt was made to open it, resulting in an explosion which killed three men, and badly injured two. Several explosions followed, some of which were distinctly felt in Wilkesbarre.

A NEW Polar Continent seems to have been discovered in the middle of the Arctic Ocean. The existence of the land has long been known, but is has never yet been explored. If it possesses verdure, and reindeer, walrus, seals, etc., as the letters published would indicate, it *must be inhabited.* Here is a new field for ambitious explorers to earn a fame not often offered to them. And it will not now remain long before it will be explored.—*Honolulu Com. Advertiser.*

EMPEROR THEODORE, of Abyssinia, against whom the English have recently sent out a hostile expedition, rules over 5,000,000 semi-barbarous individuals. They are Christians of the Greek Church. They differ from our usual nations of pure African, in that they have straight hair, and are quite black, copper-colored, or fair, according to the locality in which they reside.

Order Bussey's Combination Burglar and Powder-Proof Keyless Lock!

REASONS WHY.

- 1st. It is the best Combination Lock known.
- 2d. It is impossible to pick it.
- 3d. It can be subjected to over half a million changes, and when run by a burglar, he is no nearer entrance than when he began.
- 4th. It has no key to lose.
- 5th. The more it is used the better it is liked.
- 6th. It has no signs, letters or figures, on its face.
- 7th. It is the simplest to understand.
- 8th. It is impossible to open it without knowing the set.
- 9th. It is least possible to get out of repair, as any one will be convinced on examination.
- 10th. It is the strongest Lock.
- 11th. No possible derangement of combination can be made.
- 12th. Amador County has adopted this Lock for its safes.
13. It received a special premium at State Fair

Opinions of the Press and others in regard to Bussey's Combination Lock.

The Bank of British Columbia ordered the first one of these locks introduced in this city, and the following recommendation has been received by the inventor:

BANK OF BRITISH COLUMBIA,  
San Francisco, May 24, 1866.

Recently, two of Wm. C. Bussey's new Patent Combination Burglar-Proof Locks were placed upon the vault doors of the Bank of British Columbia. They are found to operate with all the efficiency claimed by the inventor and in every way meet our fullest approval.

They were ordered upon mature deliberation, after strict investigation of their merits, in comparison with some of the most noted and popular old styles of combination locks.

We deem the lock entirely burglar-proof. It is strong in construction, without intricate or delicate parts, with simple and easy movement. We had no difficulty in either opening or closing it, nor in changing its combinations, which may be made almost innumerable.

As a California invention of extraordinary merit, we take pleasure in recommending it to public attention, believing it to possess all the advantages which are claimed for it.

WM. H. TILLINGHAST, Sub-Manager.  
We do hereby certify, that Wm. C. Bussey's Combination Lock is the best Safe Lock in existence, and indisputable to be picked. We have applied several to Vaults and Safes, to entire satisfaction to parties interested.

KITREDGE & LEAVITT,  
Pioneer Iron Works, cor. Fremont and Market sts.

SAN FRANCISCO, May 6, 1867.

I do hereby certify, that Mr. Wm. C. Bussey's Combination Lock is the simplest and strongest in construction, and the least possible to get out of repair; and for Safes and Vaults in every other respect as good as any other improved combination lock which I am acquainted with.

JOHN E. SIBLEY,  
Vault Manufacturer, Oregon street.

JACKSON, April 27, 1867.

I, the undersigned, Sheriff of Amador County, do hereby certify that I am using one of Wm. C. Bussey's Keyless Combination Locks on my safe, which is made to draw four bolts with facility. I believe the lock to be the best lock ever invented, for the following reasons:

1st.—Because it is impossible for either burglar or expert to pick it.

2d.—The lock being constructed without a key-hole, it cannot be blown to pieces by powder.

3d.—There is no possibility of deranging the combination by breaking off, or attempting to drive the knobs into the safe. And it is in fact the nearest approach to perfection yet arrived at in the art of Lock making.

R. COSNER,  
Attested by J. C. SHEPMAN, County Clerk.

JACKSON, April 27, 1867.

The undersigned, Treasurer of Amador County, do hereby certify, that I am now using one of Wm. C. Bussey's Keyless Combination Locks. It is fastened to the outside door of the Treasurer's Safe. I have no fear of any by-stander gaining a knowledge of the set of the combination, when locking or unlocking the same. If I desire to have access to the safe every few minutes, I can so adjust the combination as to open this lock in two seconds of time. I am exceedingly well pleased with the same, and I deem this lock to be all that the inventor claims for it.

OTTO WALTHER,  
Attested by J. O. SHEPMAN, County Clerk.

CALIFORNIA LOCK ANKAD.—A special premium was awarded Mr. W. C. Bussey for his superior Combination Powder and Burglar-Proof Safe Lock, at the recent State Fair. We are sure no award was ever more meritoriously bestowed. This Lock was described at length in the Press several months since. At that time it was adopted by several banking houses in this city, and we are now assured that the remarkable claims asserted in favor of the Lock at that time, have been confirmed since by its practical use. We feel an interest in this California invention, and wish to see it speedily meet with the success it is ultimately certain to attain. Mr. Bussey, having properly first fairly tested his lock in California, is now desirous of introducing it in the East, and offers to dispose of the right for several States at very reasonable rates.—*[Mining and Scientific Press, Sept. 29, 1866.]*

They are the only SAFE lock ever invented. Every State and County treasury vault, and every bank and business place should have one.—*[Amador Ledger.]*

This is a lock in which a series of rotating annular tumblers is employed, and it consists in a novel arrangement of such tumblers in connection with one or more arms connected with one or more bolts, whereby an extremely simple and effective lock is obtained, presenting an almost unlimited number of combinations. For which he was awarded a special premium at the State Fair.—*[Sacramento Union.]*

We, the undersigned, practical Locksmiths, unhesitatingly pronounce Bussey's Improved Combination Burglar Proof Lock to be the most reliable lock constructed.

F. MARK & CHAS. WILSHIRE,  
No. 18 Post street.

R. COSNER, Sheriff.  
O. WALTHER, Treasurer.  
W. JENNINGS,  
C. H. INGALLS, } Supervisors.  
L. MC LAINE, }

Any good blacksmith can put this lock on safe doors. Boxed or single old locks removed and this placed in their stead, to work one, two, three or four bolts, as the case may be.—*[See page 30 in Pacific Coast Directory.]*

A deaf or blind man can open this lock when he knows the set and understands the full manipulation, without any expert detecting the combination.

## Canvassing Agents.

Our Friends can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office, Jan. 11, 1866.

Mr. C. T. Rancy is our duly authorized agent for Sacramento County, Nov. 29, 1867.

Dr. L. G. Yates is our duly authorized traveling agent, July 6, 1867.

Mr. A. B. Butler is a duly authorized traveling agent for this paper, July 15, 1867.

Mr. H. C. Northrop, is our duly authorized agent for Oregon, Washington, Idaho, and Montana, Aug. 17.

## San Francisco:

Saturday Morning, Dec. 14, 1867.

## Notices to Correspondents.

A STOCKHOLDER requests our opinion respecting statements made by the correspondent of a daily evening cotemporary respecting the future prospects of the Comstock lead, and those made by the *Stock Circular*, and also the inferences which may be drawn from the conduct of those having the management of the principal mines of Washoe. To these queries all that we can reply is, that the boldness of the charge made in the two communications alluded to, would, if we felt certain they were made in good faith, incline us to consider them as well founded. There are, however, several matters too obscurely described for us to place implicit faith in that dolores statement. For instance, in the communication alluded to, it is boldly stated that in all the mines on the Comstock lead whereon deep shafts have been made, the entire of the ore has "petered out." This is a vague phrase, and ought to be explained fully; for instance, does the correspondent mean that only barren rock is found at the greatest depths yet reached; such as slate porphyry, simple quartz, greenstone, etc., etc., or merely that the vein has thinned out, either with or without becoming poorer as respects the precious metal, or does he intend it to be understood merely that the rock so procurable is merely so poor as regards the precious metals that it will not pay the expenses of extraction and reduction? We should like to hear from some of our Washoe friends respecting these points.

QUID RIDES, Stockton.—This correspondent seems to think he is able to be quizzical at our expense, by propounding the inquiry: Is there any connection between the English philosopher, Cavendish, alluded to in our last notices, and the invention of "Cavendish tobacco?" Quid may have laughed in his sleeve when he penned his query; he will, perhaps, in future, if a grower or smoker of "the weed," enjoy it with greater gusto by possessing the knowledge that indirectly this well known, in fact we may say world renowned, form of commercial tobacco is derived from the Cavendish family. William Cavendish, the first Earl of Devonshire, was one of the earliest adventurers who settled and planted a colony and plantation in Virginia; he also had a large grant of land in the Bermudas; the latter was until recently, and, perhaps, still is, denominated the Cavendish estate. Tradition adds, that the estates so owned in Virginia had also the same title, and that it was from one or both of these properties that the first Cavendish tobacco was derived. So much for fame. Some square packets of what might easily be taken to be pressed rotten leaves, have spread the name of Cavendish over a wider circle than all the patriotic deeds, literary or philosophic achievements which its most illustrious bearers have been able to accomplish.

AGRICOLA.—The most valuable mineral constituents, in order to form fertile soils, are those containing potash and phosphoric acid; no soil can be fruitful which is not capable of yielding to the roots of plants this indispensable alkali and acid through the medium of the solvent influence of water. Nitrogen may be absorbed by growing plants either from the nitric acid or ammonia existing in a moist atmosphere or deposited by rain, but the two former named substances can only be derived from the soil. The great bulk of all soils merely constitute a nidus for the growing plant.

## The State Geological Survey.

We give to-day a carefully prepared synopsis of the communication read on Monday of last week, before the Academy of Sciences, by the State Geologist, giving a somewhat detailed report of the progress which has been made by the Survey during the past two years, and which, we presume, embodies substantially the report which he has made to the Governor, to be laid before the present Legislature. From a perusal of this document, it will be learned that the Survey is still steadily prosecuting its work, and constantly adding to the already vast accumulation of material, important to the industry of the State, to say nothing of its great scientific interest. "The charts and drawings of the Survey have already been of great practical utility to the authorities and citizens of many counties, who have been allowed access to them in advance of publication whenever public interests demanded. The information and advice given by the officers of the Survey have prevented many unprofitable investments, and would have prevented more, had they been more often heeded. Besides these points, and many others which bring the Survey close home to our material interests, and make it minister to our pecuniary wants, we should consider that in enabling us to increase the common stock of knowledge, and to swell the number of facts upon which inductive science constructs its finest fabrics, the Survey has done the State noble service."

No other survey has been undertaken where so much has been accomplished in so short a time, or at so small a cost. It is a fact notorious to all who are intimately acquainted with the history and personnel of the Survey, that most of the members thereof have retained their positions more out of love of scientific research in a new and rich field, than for the pecuniary consideration derivable from their respective positions. There neither is nor has been, scarcely a member of the Survey, who could not have commanded better pay for his services in other fields of labor or research. We trust that the present Legislature will look with more interest upon this important enterprise than have their predecessors, and make a liberal appropriation for the continuation of a work which has been so well begun.

THE VOLUME OF THE SAN FRANCISCO MUNICIPAL REPORTS for the past year, appears to have been prepared with more than usual care, and is also more voluminous and complete than any previous issue. It forms a book of 530 pages. It contains a carefully written and instructive report from the retiring Superintendent of Public Schools, which covers 100 pages of the volume. In addition to the general statistics of the schools, scholars, receipts, expenditures, etc., it also contains some valuable remarks on the general management of public schools, and a number of excellent suggestions for the improvement of the system. The appendix, compiled by Mr. Bingham, is among the most valuable and interesting portions of the volume, especially to the general reader. It contains information with regard to about forty different matters affecting the city, which can nowhere else be found so concisely stated. It contains reminiscences of early days of the city, information with regard to our military organization, the sea wall, the overland railroad, property in the various wards, valuations of former years, etc., etc.

THE FIFTH of the series of articles on the "Freiberg or Barrel Process for the Reduction of Silver Ores," came to hand too late for insertion this week. These articles have been prepared with great care, and we are pleased to learn that they are being read with much interest by all our readers who take any special interest in the subject treated upon. They will probably be concluded in two more numbers.

## Mining Claims, and Water Rights.

It is a somewhat singular fact that in American legal literature there should have existed no original work on Mining Law, until the appearance of the work bearing the title affixed to this article, and recently issued by Roman & Co., of this city. This work has been written with great care, and with special reference to the Act of Congress of 1866, granting a general license to mine on the public lands, and providing a way in which all who desire to do so, can secure titles in fee to their mining claims. The author, Gregory Yale, a well known lawyer of this city, has evidently devoted much attention to the entire subject of legislation and judicial action with regard to mines, going back into early English and Spanish jurisprudence, and tracing out the customs, regulations, and legislation which has gradually grown up therefrom in our own country.

A large space is devoted to the early customs and regulations of this State, which have more recently received the sanction of both state and national legislation. In the course of this resumé, no less than two hundred and fifty-six cases are noted, more or less at length, which comprise almost every possible question which can come up under the "mining rules and regulations" which govern courts in this State.

The Act of Congress of July, 1866, is taken up section by section, and fully discussed; while full instructions are added for procedure under each section. The mode of perfecting land claims is also given, and the various questions growing out of contested claims are fully presented and discussed.

Several chapters of much interest to the general reader as well as to those engaged in mining, are given in relation to water rights, corporations, the general geology of the State, mining education and a mining college. The subject of water-rights is treated on at great length, all the important decisions given, etc.

In addition to the mining laws of Congress and this State, the statutes of Oregon, Idaho, Colorado, Arizona and Nevada are also given, either in substance or detail. A page is also devoted to the mining regulations of Australia. The work concludes with a very full glossary of mining terms, and terms connected with mining, and forms an octavo volume of 452 pages, which should find its way into the house of every person in the State in any way extensively engaged in mining. It meets a want long felt, and fully supplies the need.

SIR JOHN FRANKLIN.—The last news from Captain Hall, who is now prosecuting the search for the remains of the lost navigator, is to the effect that he had obtained information which makes it probable that the body of Sir John was deposited in a brick vault, built for the purpose by his men, and afterwards covered with large flag-stones. Captain Hall was about starting for the point indicated. As the region is inhabited by hostile Esquimaux, he offered \$500 in gold to each of the first five men belonging to the whaling fleet then in the Arctic, who would volunteer to accompany him. The party was soon made up, and we may expect to learn something definite by next midsummer, in reference to the question for the solution of which so much has already been risked.

THE MESSAGE of the retiring Governor, F. F. Low, is a business-like, straight-forward document, and does him much credit. It makes a very satisfactory exhibit of the condition of the State. There are now over \$1,200,000 in the Treasury, with nearly all the taxes of the present year to come in. The funded debt amounts to \$5,126,500, which the Governor thinks can be easily liquidated in ten years. A reduction in taxation to the amount of ten cents on \$100 is recommended. The message shows the State to be generally prosperous.

NEW QUARTZ MILL.—A 10-stamp mill, with engine and other machinery complete, left the Aetna Iron Works on Saturday morning last, for the Merrimac Mining Company's mine, in Butte county, about fourteen miles southeast from Oroville. The stamps weigh 650 lbs. each, work in two mortars, of the latest and most approved make. These mortars are copper-lined throughout upon their sides, quite to the top. The engine has a 12-inch cylinder with 24 inch stroke, and a balance wheel weighing 1½ tons. The hoiler, which is 16 feet long by 48 inches in diameter, with 46 tubes, was made by Moninan & Aiken, on Mission street. It was made by the best No. 1 CH. (charcoal hammered) American iron. All the castings connected with this mill were very smooth, and every thing about the work was of a superior finish. We noticed, what was to us a novel and very convenient arrangement for holding up the stamps, an iron shaft passed across the back of the battery upon which was affixed iron sockets, corresponding in number to the number of stamps, working with a sleeve upon the shaft, and intended to receive short levers which could be readily made to catch under the tappets and thus easily and securely hold up any one or all of the shafts as might be desired. The main belt, carrying the power from the engine to the machinery of this mill, was made by M. M. Cook & Son, of the best oak-tanned California leather. It is 50 feet long by 10 inches wide, and copper fastened. Every piece of leather which went into the belt was carefully selected for that purpose, to secure its uniform wear and tension. It is claimed that a leather belt, when properly made and of the right material, is superior to rubber. Notwithstanding the false feeling of distrust in California leather for hose, belting, etc., its actual superiority over Eastern make is fast becoming recognized. It will soon be quite as generally appreciated here as it is at the East, where we understand California oak-tanned leather is worth fully three cents more per pound than Eastern leather.

CALIFORNIA MINING MACHINERY FOR NICARAGUA.—The Union Foundry has just completed a 10-stamp quartz mill, with amalgamating machinery (such as is generally used in Grass Valley) complete, which will be shipped on the next Nicaragua steamer for the Javali mine, in the Chontales mining district, near the town of Libertad, and about fifty miles east of the most northerly point of Lake Nicaragua. This mine belongs to an English Company, whose head-quarters are in London; they have given their orders for machinery here for the reason that they think a better character of gold-mining machinery can be furnished from the foundries in this city than would be obtained from English foundries. The Chontales mining district yields both gold and silver ores. It was first made known to the world about two years after the gold discovery in this State. But little, however, has been done until quite recently in opening the mines. There are as yet only two or three mills in operation there, one of which belongs to an American named George King, who has just put up a steam mill, the engine and machinery for the same having been brought out from New York. The Javali Company's mill will be run by water, as they have a good water power convenient to the mine. No deep mining has yet been done; the quartz, which is of a friable nature, being worked directly from the surface. The general average, so far, has been about \$16 to the ton, which, counting the low price of labor there, and the small cost of mining—the veins being very large—is good pay.

There is a fair prospect that a valuable mining district will be eventually opened up there. As yet but little is known of its extent. We are not aware that any placer mines have yet been found. Ready communication might be opened with the mines by a road, not over fifty miles in extent, connecting with the navigable waters of Lake Nicaragua. Should extensive mines be opened there, they will probably be supplied with machinery chiefly from this city. The machinery, about to be sent down from the Union Foundry, will no doubt present such a favorable contrast with that heretofore used as to determine all future purchases from this point.

[Written for the Mining and Scientific Press.]

**On the use of a Concentrated Solution of Salt, saturated by Chlorine Gas, for the extraction of Gold and Silver.**

BY DR. LANSZWEERT.

EDITORS PRESS:—In your issue of December 7th, in number four of the series of articles by Prof. Rowlandson, appears the following: "It has been proposed to obtain gold and silver at the same operation, when employing Augustin's mode, by impregnating the hot solution with chlorine, which it has been asserted would have the effect of dissolving the gold present, also. I have no knowledge how far any practical results have followed from the above suggestion."

In my general review, No. V, of "The Problem of Gold and Silver Extraction," published in the MINING AND SCIENTIFIC PRESS of March 18, 1865, I referred to a modification of the Plattner's or Calverts chlorination process, as applicable to *poor ores*, and especially to those ores containing a natural alloy of gold and silver, such as are rebellions, generally, to any other treatment. I am not aware as to the amount of chlorine gas capable of being held in a *hot solution of salt*; but if I recollect rightly, the author of the process is Mr. Poumares, and it was published to the world in the *Oestr. Zeitschr. für Berg und Hüttenwesen*, 1863, with the following remarks:

"Gold can be extracted through chlorine, as by Plattner's method. The silver in these ores, (according to their nature and previous treatment,) is obtained by leaching the same with ammonia, solutions of chloride of sodium, or of hyposulphites, or even by hot water, according to the methods of Rivero, Gmelin, Augustin, John Percy, Ziervogel, Patena, etc. But applied to ores containing a certain alloy of gold and silver, the above methods are far from being satisfactory; as there generally remains, in the tailings, a large amount of the precious metals. They have tried to extract both metals, alternately, according to the process applicable to each; first, for the silver, they employed Augustin's or Ziervogel's methods; then for the gold, Plattner's, and *vice versa*; but there always remained in the tailings an auro-argentiferous residuum, which required a repetition of the process, or involved the necessity of proceeding to their extraction by concentration in the dry way. The reason for this is easily explained, as each of the above metals, by itself, insoluble in the solvent of the other. In treating an auriferous silver ore by chlorine gas, a portion of the gold is formed into chloride; chloride of silver is formed in the meantime, and being insoluble, protects the balance of the alloy from the subsequent action of the chlorine gas, by covering it with a film of chloride of silver. In dissolving this film of chloride of silver, by solutions of ammonia, salt or hyposulphites, a pure metallic surface of gold is obtained, which also protects the rest of the metallic alloy from the action of these solutions. If the ores are rich enough, they will warrant this alternate treatment; but if too poor, the expenses of extraction would be larger than the value obtained. Heretofore such alloys have been lost in the tailings; but with the use of the above concentrated solution of salt, saturated by chlorine gas, they can be readily extracted; as such a solution dissolves rapidly and entirely an artificial alloy of gold and silver, and, as proven by experiments referred to below made on ores containing a silver alloy of gold, rebellions to any other treatment.

These ores must first be properly roasted, then leached with a concentrated solution of salt saturated with chlorine gas, and satisfactory results will be obtained. An ore treated as above, and containing only 1.24 per cent. of native alloy has left in the tailings no more than 0.019 per cent. Another poor ore containing only 0.19 per cent. of native alloy has left only 0.002 per cent.

In both cases the yield could still have been more, as, in the washing water, gold and silver were distinctly detected. Thus, the use of a *cold concentrated solution of salt saturated with chlorine gas*, would be advantageous in the treatment of poor ores containing an auro-argentiferous alloy, without concentrating the same, and with hardly any loss of the precious metals.

CONTINENTAL Life Insurance Company, 302 Montgomery street, corner of Pine.

**PEDESTRIANISM.**—The newest sensation in this line is the undertaking by Seth Wilbur Payne, to walk from New York to San Francisco in one hundred and fifty days. He started on November 11th. The distance by the route which he proposes to take, viz: along the line of the Central Pacific Railroad,—being just 3,300 miles, he must make an average of twenty-two miles per day. Mr. Payne is doing this on his own account entirely. Walking is no new thing to him. Some years since he perambulated nearly all Europe, and gave to the world a history of what he saw. In the present case, he intends to do the same thing, and he apparently set a time for the completion of the task, simply because it happens just now to be in the fashion. No wager is dependent upon his success, as in the case of Weston, who has just pocketed ten thousand dollars for a walk from Portland, Maine, to Chicago, Illinois. Of course, therefore, there will be no excitement among "the fancy,"—no ovations, no cheers, no goings-out to meet, no pictorial illustrations—with minute descriptions of his every article of dress. Yet which example is best worth following?

**ANOTHER NEW MINING JOURNAL.**—We have received two numbers of a new mining journal, just established in New York, and entitled the *Mining World*. It is published by Bliss & Thompson, at No. 95 Liberty street. This journal is ably edited, and one of the neatest looking papers in the country. If it meets with the success which a journal of such excellent literary and practical merit is entitled to, it cannot fail to bring a most remunerative pecuniary return to its enterprising publishers.

**THE VULTURE MINE.**—Four of Hendy's Concentrators were sent out last week from the Union Foundry, for the Vulture mine, in Arizona, where four others have been for some time at work. We are informed that a large sample lot of concentrated sulphurets from this mine have been recently worked in this city, which yielded at the rate of \$812 to the ton. It was in consequence of this extraordinary yield that the company determined to double the number of concentrators at their mill. We understand that this mine is rapidly developing into one of the most valuable mining properties on the coast.

**NEW MECHANICAL FIRM.**—We notice that Messrs. Baurhyte, McAfee and Spiers have associated themselves as a new firm for carrying on the boiler making and general machine shop business, on Howard street, between Fremont and Beale. We shall probably take occasion for further reference to this firm next week.

**MARKET STREET HOMESTEAD ASSOCIATION.**—J. S. Lutz, Secretary. Office, 305 Montgomery street, corner of Pine, San Francisco. 2v15

**BUSINESS NOTICE.**—Mr. A. T. Dewey, of this journal, contemplates a visit of several months in the Atlantic States, a portion of which time he will spend in Washington, New York and Boston. Any of our Eastern friends who wish to communicate with him, for business or other purposes, will address their letters to "Westfield, Mass."

**JACOB SNEW, Pioneer Photographer,** 612 Clay street, north side, four doors above Montgomery, (date 315 Montgomery street) takes all kinds of Photographs in the best style of the Art. He would invite especial attention to the new "Cabinet Photographs," which he is taking to perfection. 10v14f

**SECRETARYSHIP FOR MINING COMPANIES.**—A gentleman of education, ability and experience, is desirous of procuring a position as Secretary, or Assistant Secretary, in some good Mining Company. Has most unexceptionable references. Address "SECRETARY," at this office. 6v15f

**CO-OPERATIVE UNION STORE.**—This is becoming one of the most useful institutions in the city, and the Mechanic and Laboring Man fully appreciate it. They are now enabled to buy their Groceries and Provisions twenty per cent. cheaper than ever before, and the very best articles in market. The store is located at 115 Sutter street, Lick House Block. 22v15f

**Save Your Teeth.**—Do not have them extracted without first consulting a good Dentist. The loss is irreparable, and, in many instances, unnecessary. DR. BEERS, corner of Montgomery and Sutter streets, over Tucker's Jewelry Store, makes a specialty of filling the fangs of dead Teeth, and building up broken crowns with pure gold—thus restoring them to their original usefulness and beauty. Call and examine the work. Finest quality of artificial work also manufactured. 16v14f

**NORTH AMERICA Life Insurance Company.**

Usual Restrictions on Occupation and Travel ABOLISHED!

Policies of this Company are guaranteed by the State of New York, which is true of no other Company on this Coast.

The most Responsible and Liberal Company in the World!  
**J. A. EATON & CO.,**  
Managers Pacific Branch, 302 Montgomery st.  
2v14f9p SAN FRANCISCO.

**SIXTH INDUSTRIAL EXHIBITION UNDER THE AUSPICES OF THE MECHANICS' INSTITUTE, SAN FRANCISCO.**

The undersigned, acting under authority from the Mechanics' Institute of the City of San Francisco, take great pleasure in announcing to the public that they have resolved upon holding an Industrial Exhibition in the month of August, 1868, on a much larger scale than was ever before attempted on this coast; and they make this early announcement of their intention, that all who may desire to participate shall have ample time for preparation. A programme, embracing rules and regulations for the government of participants, with a list of Premiums to be awarded, etc., is receiving such earnest and careful attention as the importance of the enterprise demands; and in due season the same will be made public by circular letters widely distributed, and by advertisements in the leading journals of this coast.

**Executive Committee:**

**SOMETHING NEW AND GOOD!**

**TRY IT!**  
**PRESERVED COFFEE,**  
PREPARED FROM  
**THE BEST OLD GOVERNMENT JAVA COFFEE,**

Condensed in the form of a Paste, by a process patented September 3d, 1867. One ounce equal to two of the best Ground Coffee, and suitable for any gentleman's table. Preserves its strength and flavor without deterioration in any climate, and without regard to length of time. If you want Cheekers, apply it yourself. Give our Coffee a trial, and if it is not fifty per cent. cheaper and better than any other, we will return your money.

**FRANK SILVER & CO.,**  
No. 10 Stevenson street, near First, San Francisco. 24v15-3m

**Pacific Chemical Works.**

**Acetic Acid, Nitric Acid, Muriatic Acid, Sulphuric Acid, Cyanide of Potassium,**  
**AND CHEMICALS OF ALL KINDS,**  
Manufactured by the PACIFIC CHEMICAL WORKS,  
**FALKENAU & HANKS,**  
Laboratory, Sixteenth street, near Folsom. Office, 623 Montgomery street, San Francisco. 24v15f

**Manzanita Pipes!**

**WHOLESALE AND RETAIL.—SALESROOM, NO. 55**  
Third street, near Mission. Factory, No. 10 Stevenson street, near First, San Francisco. These Pipes are manufactured from the best Manzanita Manzanita, as sweet as Meerschaum. 24v15-3m JACOBSON & SPAULDING.

**To Quartz Miners.**

**Two Quartz Mills for Sale at very Low Rates.**  
PARTIES WISHING TO PURCHASE WILL SAVE 50 per cent by calling at HOWLAND'S SAMPLE MILLS, No. 24 California street, San Francisco. 24v15-3m

**Minerals for Sale.**

**A COMPLETE COLLECTION OF VALUABLE MINERALS,** together with a large collection of Fossils, from the Trias, for sale. Every object numbered and explained. May be seen at PEIFFER'S DRUG STORE, No. 210 Post street, San Francisco. 23v15 1st

REGISTER YOUR LETTERS containing money addressed to us, or we will not be responsible. Remittances by Express must be in packages, prepaid. When practicable, it is best to remit by draft, or order, on some San Francisco bank or firm.

**Builders' Insurance Company—**  
OFFICE IN THE BUILDING OF THE CALIFORNIA SAVINGS BANK, California street, one door from Sansome street. 10v14f9p

**Perry Davis' Vegetable Pain Killer.**

Sudden colds, coughs, etc., can be cured immediately, as hundreds can testify, by mixing about one teaspoonful of Perry Davis' Vegetable Pain Killer with four tablespoonfuls of molasses, mixed well together, and taken as your coughing spell comes on; three teaspoonfuls of the mixture will answer for a dose. Also rub a little of the Pain Killer on the hands, and inhale the scent of it into the lungs. After you have taken the medicine, bathe the throat and around the collar-bone, also across the upper part of the breast and down the sides, if they have been made sore by coughing, and you will soon get relief if you do not neglect it too long. The sooner the medicine is applied, the more speedy the relief. In all cases, if you do not get relief in thirty minutes, take it again, and bathe freely according to directions.

Sold by all Druggists, Grocers and Medicine Dealers everywhere. declm

**To Foundrymen and Blacksmiths.**  
LUMP LEHIGH AND CUMBERLAND COAL, IN ANY quantity, sacked and shipped to any part of the country, by  
JAS. R. DYER, Coal Dealer,  
413 and 415 Pacific street, bot. Sansome and Montgomery, San Francisco. 24v15-3m

**Foundry for Sale.**

A One-half Interest in the **UNION IRON WORKS, SACRAMENTO,**  
Owned by William R. Williams, is offered for sale on the most favorable terms.

**A Good Bargain**

May be had, as the proprietor is going home to Europe. It is seldom that so good an opportunity is offered for a sure and permanent investment. The business of the establishment is exceedingly flourishing, as can be shown. The Shop is of brick, new and well built. The lot is 35 feet front by 163 feet in depth, in a good location for this business, on Front street, between N and O streets. Inquire at the office of the Foundry, or address  
WILLIAM R. WILLIAMS, Sacramento, Cal. 26v13f19-16

**Oakland College School.**

THE PATRONS of this Institution have the choice of several distinct Departments. The SENIOR CLASSICAL is designed as preparatory to the College of California. The SENIOR ENGLISH affords a complete course of instruction in the English branches, in Theoretical and Practical Business, Science and Art. The JUNIOR is especially qualified to meet the wants of young boys, for whom separate apartments and Teachers are provided. Throughout all the various departments, great attention is given to the study of the Modern Languages. For further information, or Catalogues, address,  
**I. H. BRAYTON, Principal.**  
OAKLAND, California. 5v15f9p

**ROOT'S Patent Force Blast Blower.**

Adapted for Smelting, Foundry, Mining and Steamships. Requires 50 per cent less power than any Blower now in use. For further particulars, address KEEF, BLAKE & CO., Stockton; or Wm. T. Garrett, corner Mission and Fremont streets, San Francisco. 5v15f19p

**PACIFIC Rolling Mill and Forge Co., SAN FRANCISCO, CAL.**

Established for the Manufacture of **RAILROAD AND OTHER IRON**  
—AND—  
**Every Variety of Shafting**  
Embracing ALL SIZES of Steamboat Shafts, Cranks, Piston and Connecting Rods, Car and Locomotive Axles and Frames. —ALSO—

**HAMMERED IRON**  
Of every description and size. Orders addressed to PACIFIC ROLLING MILL and FORGE CO., Post Office, San Francisco, CAL., will receive prompt attention. The highest price paid for Scrap Iron. 9v15m9p

**DR. FONDA'S San Francisco Eye Infirmary.**  
Permanently established for the treatment of all diseases of the Eye. Dr. F. was for seventeen years principal of the Lafavette (Ind.) Eye Infirmary. F. W. FONDA, M. D., Surgeon in Charge. Office, 402 Montgomery street, opposite Wall, Fargo & Co's. 4v15-19p

**AGENTS WANTED**

ENERGETIC MEN OR WOMEN CAN MAKE MONEY in canvassing for our NEW BOOKS and ENGRAVINGS. One Agent reports thirty-three orders for one Book in three days. Address, PACIFIC PUBLISHING COMPANY, 4v15f9p 305 Montgomery street, San Francisco, Cal.

Established in 1849--Corner First and Mission streets, San Francisco.

HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic Hay, Rice, screw and Drop Presses, Colming Machinery, Pile Drivers, Bark and Mill Mills, and all kinds of Castings.

AMALGAMATING MACHINERY.—Wheeler & Randall's improved Tractory Curve Pan, Zenas Wheeler's improved flat bottom pan, Beldin's pan, Yeatch's tubs, Printer's concentrators, Waklee's pans, Beers' pan, German Barrels, Arastra Gearing, Chile Mills, Settlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams, Pans and Tubs. BLAKE'S PATENT QUARTZ CRUSHERS, of all sizes.

Machinists and Foundries.

PALMER, KNOX & CO., Golden State Iron Works, Nos. 10, 21, 23 and 25 First Street, SAN FRANCISCO.

MANUFACTURE ALL KINDS OF MACHINERY, TEAM ENGINES AND QUARTZ MILLS DUNBAR'S IMPROVED Self-Adjusting Piston Packing, Requires no springs or screws; is always steam tight; without excessive friction, and never gets slack or leaky.

WILLAMETTE IRON WORKS, PORTLAND, OREGON. Steam Engines, Boilers, SAW AND GRIST MILLS, MINING MACHINERY, WROUGHT IRON SHUTTER WORK, AND BLACKSMITHING IN GENERAL.

UNION IRON WORKS, Sacramento. WILLIAMS, ROOT & NEILSON, MANUFACTURERS OF CROSS' PATENT BOILER FEEDER, STEAM ENGINES, BOILERS,

DUNBAR'S PATENT SELF-ADJUSTING STEAM PISTON PACKING, for new and old cylinders, manufactured to order. Front Street, between N and O streets, 14v11 SACRAMENTO CITY

I. H. SMALL, MACHINE SHOP, BUILDER OF Steam Engines, Sawmills, Mining Machinery, and Wood Planes. Repairing of all kinds done with promptness and dispatch.

GLOBE Foundry and Machine Shop, STOCKTON, CAL.

KEEP, BLAKE & CO., MANUFACTURERS OF Quartz, Saw and Grist Mill Irons, Steam Engines, Horse Powers, Mining and Irrigating Pumps, Car Wheels, Derrick Irons, Hoist Fronts, Iron Fencing, Balcony Railings, etc., at San Francisco prices. Orders solicited and promptly executed.

GEORGE T. PRACY, MACHINE WORKS, Nos 109 and 111 Mission street, between Main and Spear, SAN FRANCISCO. STEAM ENGINE, FLOUR AND SAW MILL And Quartz Machinery, Printing Presses, MACHINERY OF EVERY DESCRIPTION MADE AND REPAIRED.

SAN FRANCISCO Foundry and Machine Works, N. E. Cor. Fremont and Mission streets, Manufacturers of Marine and Stationery Engines Quartz Machinery, Saw, Flour and Sugar Mills, Mining Pumps, Hoisting Gear, Agricultural implements, etc.

Wine, Cider, Cotton and Tobacco Presses of the latest Improved Patterns. STEAM ENGINES AND BOILERS, Of all sizes, constantly on hand; Quartz Mill Shoes and Dies warranted to be made of the best white iron.

LEWIS COFFEY, J. S. RISSON, LEWIS COFFEY & RISSON, Steam Boiler & Sheet Iron Works. THE only exclusively Boiler Making establishment on the Pacific Coast owned and conducted by Practical Boiler Makers.

CALIFORNIA BRASS FOUNDRY, No. 125 First street, opposite Minna, SAN FRANCISCO. ALL KINDS OF Brass, Composition, Zinc, and Babbitt Metal Castings, Brass Ship Work of all kinds, Sinks, Shabing Nails, Rudder Braces, Hinges, Ship and Steamboat Belts and Gears of superior tone.

FULTON Foundry and Iron Works. HINCKLEY & CO., MANUFACTURERS OF

STEAM ENGINES, Quartz, Flour and Saw Mills, Moore's Grinder and Amalgamator, Brodie's Improved Crusher, Milling Pumps, Amalgamators, and all kinds of Machinery.

NEPTUNE IRON WORKS, Corner of Mission and Fremont streets, SAN FRANCISCO.

MARINE, Locomotive, And all kinds of HIGH PRESSURE Steam Boilers MADE. All Boilers guaranteed and tested by U. S. Boiler Inspector before sent out of the Shop, at Shop expense.

JOHN LOCHHEAD'S Steam Engine Works, Beale street, near Mission, San Francisco.

STEAM ENGINES OF EVERY DESCRIPTION BUILT to order—Marine, Stationary, or Locomotive. HOISTING AND PUMPING ENGINES, PORTABLE ENGINES, OF ALL SIZES, DONKEY PUMPS, Etc., Etc., Etc.

SOUTH BEACH IRON WORKS, Near corner of King and Third streets, San Francisco. MARINE ENGINES, AND ALL KINDS OF MACHINERY FORGING.

ELECTROTYPE CUTS, ENGRAVINGS, ETC.—Our Job Printing Office is abundantly supplied with elegant engravings, or names, and other embellishments to suit the various branches of industry in this State.

Rates of Postage on Printed Matter to Europe and Asia.

The Post Office Department has made arrangements by which a number of European and Asiatic countries, hitherto beyond the reach of our mail communication except by letter, are brought within the range of delivery of all, or nearly all, United States mail matter.

Under the arrangement now completed, prepayment of postage (sometimes at high rates), is made necessary in all cases. The following official statement gives a full list of the countries—with some of which there has been regular communication—that are now included in the delivery by way of Hamburg and Bremen:

- Rates of postage on newspapers and other printed matter (periodicals, etc.) sent from the United States to countries in Europe and Asia, by Bremen or Hamburg mail—prepayment compulsory: NEWSPAPERS—MARKED AS FOLLOWS: Bremen, by Bremen mail—2 cents each.

PERIODICALS, ETC. Bremen, by Bremen mail—1 cent per ounce. Hamburg, by Hamburg mail—1 cent per ounce.

These charges are in each case in full to destination, combining rates between the United States and Bremen or Hamburg, and the rate beyond Bremen and Hamburg to points of delivery.

CURIOSITIES OF THE EARTH.—At the city of Modena, in Italy, and about four miles around it, wherever the earth is dug, when the workmen arrive at the depth of 63 feet, they come to a bed of chalk, which they bore with an augur five feet deep. They then withdraw from the pit before the augur is removed, and upon its extraction, the water bursts up through the aperture with great violence, and quickly fills the new-made well, which continues full, and is affected neither by rains nor droughts.

CALIFORNIA TOOL AND FILE FACTORY. Blacksmith and Machine Shop. No. 17 Fremont street, between Market and Mission, S. F.

LINCOLN IRON WORKS, No. 51 Beale st., bet. Market and Mission. D. & W. FOURNESS, Prop'rs. STEAM ENGINES, Flour and Sawmills, and MACHINERY of all descriptions made and repaired at shortest notice.

**AN UNDERGROUND FOREST IN IOWA.**—The McGregor, Iowa News learns that Captain Appleman, who lives on a point of land nearly the highest in Fayette county, east of Clermont, while sinking a well, a few days ago, through heavy clay at the top of a hill, at the depth of twelve or fifteen feet, came upon the top of the forest, the trees, many of them standing upright in the solid earth. The trees were small, about fifteen feet in height, and standing in a position showing that the earth by which they were submerged had been gently and gradually deposited around them, else they could not have maintained an erect position.

**NEW TREATMENT FOR BRONCHITIS.**—A new and interesting method of treating bronchial affections has lately been introduced. By means of an apparatus similar to the so called odorator, a solution of sulphate of zinc or nitrate of silver is reduced to an extremely fine spray, so that it can be inhaled with the breath, and applied directly to the inflamed mucous membrane.

**SAPPHIRES IN MONTANA.**—We have been shown by N. E. Collins, says the Montana Herald, six fine sapphires taken from claim No. 4, on El Dorado Bar, which have just been elegantly cut in New York city. Experienced lapidaries pronounce these stones to be of very fine quality and second only to diamonds in value. They are in color light and dark-blue, straw-color and red.

**WINE PRODUCTION.**—Within a radius of five miles of Folsom over 100,000 gallons of wine will be made during the present season. We arrive at the above figure from a careful calculation of the amounts given us by the owners of the different vineyards and gardens in this place and its vicinity.—*Telegraph.*

**HEAVY BUSINESS.**—A gentleman in Petersburg, Virginia, has succeeded in teaching four chickens to draw a miniature wagon, in which a big white rooster rides. They rattle over a lawn with great speed, while the rooster looks as grave as a bishop.

**IMPROVEMENT IN THE SPONGE BUSINESS.** Since the organization of a company in England for the purpose of preparing sponge to be used for upholstery and all purposes for which curled hair is used, the trade in sponge at the Sandwich Islands is likely to become of some account. A fine quality is found there.

**A CLOUD OF BUTTERFLIES.**—Milan, Missouri, was recently invaded by a cloud of butterflies. The air was filled with the colored beauties above, below, and around. They traveled in a southwesterly direction, and were fully an hour in passing.

The land of the Trinity and St. Paul's churchyard, in New York, is of such a value that every grave is estimated to be worth \$2,000.

A joint stock company has been established in Australia for the purpose of boiling down into tallow 10,000 sheep a week.

Among the great engineering works of the day is a tunnel under the river Mersey, to connect Birkenhead with Liverpool. The cost will be \$5,000,000.

**BLASTING POWDER.**  
PRICE, \$2.50 PER KEG.

**THE GOLDEN ERA.**

Founded in 1852, it is the oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent.

**THE GOLDEN ERA**  
Is the most universally popular of all the Weekly journals. It presents forty-eight columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected matter. It is a welcome guest in Cottage and Cabin; the favorite at the fireside in city and country; the most useful, agreeable and altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe and elsewhere. Every household in the mountains and valleys, the cities, towns and mining camps of California, and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor. Inspired with the genius of the age, it is progressive, and aims not so much at distinction as a newspaper, as at honorable success in its capacity of a great Moralizing and Improving Influence. Exercising a positive power for good, and wielding a permanent influence, many able and eminent writers choose its columns as a means of communicating with the public. No effort will be spared to make it a thoroughly California newspaper, and worthy of the support of all classes of our citizens.

**Rates of Subscription:**

Our Patent Agency. The PATENT AGENCY OF THE MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the Press, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

MINING AND SCIENTIFIC PRESS.—This valuable journal has closed its fourteenth volume and entered upon its fifteenth. It is a publication that should have a wide circulation among our mining and mechanical population. It publishes, in addition to the most complete summary of mining news, a vast amount of information on the application of science to mining and the mechanic arts. It contains notices and descriptions of all new mining processes, and all machines intended to facilitate the extraction of the precious metal from ore and rock with which it is blended. It also chronicles all new inventions, and, in most instances, contains drawings to illustrate them. To miners and mechanics it is a paper of incalculable value, and should be in the hands of all who desire to keep themselves posted in the progress being made in these departments.—Irada Union. Postage.—The postage on the MINING AND SCIENTIFIC PRESS to any portion of the United States is twenty cents per annum, or five cents per quarter, payable in advance at the Post Office delivering the paper. Postage free in the city and country. Foreign postage (with few exceptions) two cents per copy, prepaid. To Bremen and the German States (marked via Bremen and Hamburg line), three cents per copy, prepaid. Single copies to any address in the United States, two cents.

Professional Cards.

TRUESELLE, DEWEY & CO. BOOK AND JOB PRINTERS, MINING & SCIENTIFIC PRESS OFFICE 505 CLAY STREET, SAN FRANCISCO.

To Those Whose Interests We Represent.

While there is every reason for gratification at the circulation which this journal has already reached, we are yet well aware that there are great numbers of miners, mechanics and lovers of science to whom it might be made a source of much usefulness and profit.

New subscriptions will be received at all times by mail or otherwise. Those who have friends that they think might be interested or benefited by the paper, will confer a favor both upon them and us by calling their attention to this matter, and at this time by so doing they will place us under still greater obligations to themselves, and enable us by its increased receipts, to add still more to the value of the paper.

We trust that it is needless to urge upon our readers the necessity of promptly renewing their subscriptions. The two indexes for volumes XII and XIII, which we have already published, and the 500 ample pages of reading matter, apart from advertisements, to say nothing of our numerous engravings and illustrations, speak more for the value which we give for the price of a year's subscription than we can say in this connection.

Jan. 1, 1867.

National Mineral Land Law, Instructions, Blanks, Etc.

Copies of the Act of Congress, approved July 26th, 1866, relating to the Location of Mineral Lands, together with the instructions to the "United States Registers and Receivers and Surveyors General," from the Commissioner of the General Land Office Department of the Interior, dated at Washington, Jan. 14th, 1867, can be had at this office.

Postponements and Alterations.—Secretaries requested to give notice of postponements, or alterations which they may desire made in their advertisements at their earliest convenience.

T. B. WINGARD, Secretary. Office, 408 California street, San Francisco. no30

North Star Gold and Silver Mining Company, Reese River Mining District, Lander County, Nevada.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the nineteenth day of September, 1867, the several amounts set opposite the names of the respective shareholders, as follows:

Table with columns: Names, No. Certificate, No. Shares, Amount. Includes names like Oliver Ames, Cyrus W Lathrop, Jerome W Thompson, Jos C Tyler, Dan Blaisdell, John S Keyes, J Z Goodrich, Thos Dalby, Wendell Phillips, Clark, J. H. Stephenson, M S Scudder, G W Warren, Geo B Neal, W T Reynolds, Geo H Faulkner, John Kurtz, Curtis B Raymond, Jacob Burz, T W Tuttle, Geo H Vincent.

And in accordance with law, and an order of the Board of Trustees, made on the nineteenth day of September, 1867, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the Company, No. 425 Front street, San Francisco, California, on Saturday, the seventh day of December, 1867, at the hour of 2 o'clock, P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

GEORGE H. FAULKNER, Secretary. Office, 425 Front street, San Francisco, Cal. no23

POSTPONEMENT.—The above sale is hereby postponed until Thursday, the second day of January, 1868, at the same hour and place. By order of the Board of Trustees. GEO. H. FAULKNER, Secretary. dec7

Nuestra Señora de Guadalupe Silver Mining Company, Location of Works: Tayollita, San Dimas District, Durango, Mexico.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 2) levied on the twenty-first day of October, 1867, the several amounts set opposite the names of the respective shareholders, as follows:

Table with columns: Names, No. Certificate, No. Shares, Amount. Includes names like Cosmos Damm, Val Gassner, Val Gassner, Joseph G Wessel, Fr. Mueller, C. Stenbringer, J J Correll, J J Correll, F Staud, John Greif.

And in accordance with law, and an order of the Board of Trustees, made on the twenty-first day of October, 1867, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by Messrs. Badger & Chapman, auctioneers, N. W. corner of Kearny and California streets, San Francisco, Cal., on Monday, the twenty-third day of December, 1867, at the hour of 1 1/2 o'clock, P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

E. J. PEPPER, Secretary. Office, No. 210 Post street, San Francisco, Cal. dec7

Oxford Beta Tunnel and Mining Company, Esmeralda District and County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the eighteenth day of November, 1867, an assessment (No. 25) of fifty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, or to the Superintendent at the mine. Any stock upon which said assessment shall remain unpaid on the twenty-sixth day of December, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the fifteenth day of January, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

GEO. H. PECK, Secretary. Office, 212 Clay street, San Francisco. no33

Sweet Vengeance Gold and Silver Mining Company, Brown's Valley, Yuba County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the thirtieth day of November, 1867, an assessment of seventy-five cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, No. 705 Sansome street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the first day of January, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the twenty-second day of January, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

F. S. SPRING, Secretary. Office, No. 705 Sansome street. dec7

San Francisco and Castle Dome Mining Company, Castle Dome County, Arizona Territory.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twentieth day of November, 1867, an assessment of ten cents (10c) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, No. 320 Montgomery street, San Francisco, California. Any stock upon which said assessment shall remain unpaid on the seventh day of January, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-seventh day of January, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

A. R. SMITH, Secretary. Office, Room No. 40 Merchants' Exchange, California street, San Francisco. dec7

Siempre Viva Silver Mining Company, District of Zaragoza, Sinaloa, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fourth day of December, 1867, an assessment of twenty-five cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, No. 318 California street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the tenth (10th) day of January, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-seventh day of January, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

JOHN F. LOHSE, Secretary. Office, 318 California street, San Francisco, Cal. dec7

Sent on Mining Company.—Location of Works: Drytown Mining District, Amador County, State of California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-first day of November, 1867, an assessment of one hundred and fifty dollars per share was levied upon the capital stock of said Company, payable on the twentieth day of December, 1867, in United States gold coin, to the Secretary, at the office of the Company, No. 60 Exchange Building, San Francisco, California. Any stock upon which said assessment shall remain unpaid on the twenty-eighth day of December, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on the eighth day of January, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

JOEL P. LIGHTNER, Secretary. Office, No. 60 Exchange Building, N. W. corner Washington and Montgomery streets, San Francisco, Cal. no23

Whitman Gold and Silver Mining Company, Location of Works: Indian Springs District, Lyon County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the thirty-first day of October, 1867, an assessment of one dollar and fifty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, (room No. 10, 2d floor) No. 405 Montgomery street, San Francisco. Any stock upon which said assessment shall remain unpaid on the second day of December, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-third day of December, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

T. W. COLBERT, Secretary. Office, room No. 10, 2d floor, No. 405 Montgomery street, San Francisco, Cal. no2

POSTPONEMENT.—The day for settling stock delinquent on the above assessment is hereby postponed until Wednesday, the first day of January, 1868, and the sale thereof until Wednesday, the twenty-second day of January, 1868. By order of the Board of Trustees. T. W. COLBERT, Secretary. San Francisco, Nov. 27, 1867. no30

OLNEY & Co., Auctioneers and Real Estate Agents, attend promptly to all business entrusted to their care in San Francisco and Oakland. Mining and other corporations will find Col. Olney well posted and thorough in transacting sales of delinquent stock. Office, on Broadway, Oakland, and No. 313 Montgomery street, San Francisco. no10

Machinery.

VARNEY'S PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows: The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the PACIFIC FOUNDRY, San Francisco.

Hunt's Double-Action Pump

cheap, durable, strong, and not liable to get out of order Built and on hand at No. 28 Second street, and 103 Jessie street 14151st E. O. HUNT, Prop'r.

E. T. STEEN,

Commission Agent for the purchase and sale of

Engines, Boilers, Castings,

AND ALL KINDS OF MACHINERY,

No. 537 Washington, and 532 Merchant st., San Francisco

HAS FOR SALE

- One Engine, 6-Horse Power, \$100
One Engine with Boiler, 7-Horse, 600
One Engine, Link for Hoisting, 15-Horse, 800
Two Engines, Boilers, Port., 16-Horse, 1,200
One Engine, 40-Horse, 1,200
One 30-Horse Boiler, 300

Also, a great variety of

Boilers and Machinery,

CASTINGS OF ALL KINDS,

AT LESS THAN MARKET RATES.

Parties wishing to purchase or sell Machinery, of any kind, can do so to advantage through this agency. 12151st

Steam Pumps,

FOR DRAINING MINES OR ELEVATING WATER TO ANY HEIGHT.

For Steam Engines.

Giffard's Injectors,

For Feeding Boilers.

STODDART'S IRON WORKS,

Beale Street, San Francisco. 2412 3m

PATTINSON'S

HURDY-GURDY WATER-WHEEL.

The inventor of this Wheel having, after much delay, finally obtained the patent for the same, is prepared to sell rights therefor to such as may be desirous of putting them up, or continuing those already in use. This is well known among miners as the "hurdy-gurdy wheel," and is considered the most economical Water-Wheel now in use.

Notice is hereby given, that the subscriber is the inventor and holds the patent right for the construction and use of the same; and that no person has a right to manufacture or use them without his permit. 7415-17 THOMAS PATTINSON.

Brodie's Patented Improvements

FOR THE TREATMENT OF

Gold and Silver Ores.

BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER. The attention of all interested in Mining is respectfully called to this improved Machine for Breaking or Splitting Quartz, capable of similarly crushing, simplicity of action and lightness of construction, so far as compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low prices: No. 1-10-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut-... \$600

No. 2-15-inch Crusher, capable of similarly crushing through five to six tons per hour... 850
No. 3-18-inch Crusher, will in a similar manner crush from seven to eight tons per hour... 1,200

The frame is made of cast iron, bound with heavy wrought iron bands, making it very strong, and at the same time light and portable. The crusher is bolted to a wood frame of sufficient height to clear the fly-wheel, and allow the crushed quartz to pass off. The dotted lines show the eccentric shaft by which the power is applied direct to the movable jaw. B represents the movable jaw, and G the fixed jaw. H represents the link or radius bar. E represents the bolts for regulating the opening, F, which can be regulated at pleasure, so as to graduate to the size to which it is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designated.

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, D, gives the movable jaw, B, a forward and downward motion at the same time, and which makes the hardest rock yield and separate into fragments of any desired size. The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Rawhide Ranch, Tuolumne county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Fulton Foundry, First street, San Francisco. The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Rawhide Ranch" Mine in Tuolumne County: RAWHIDE RANCH, Tuolumne Co., Sept. 28, 1866. JAMES BRODIE, Esq., San Francisco-My Dear Sir: It gives me pleasure to inform you that I have for the past three months had one of your largest sized Rock Crushers in use, at the Rawhide Ranch Mining Company's Mill, which has entirely met my expectations; and I have no hesitation in recommending it to all who are in need of a machine for rapidly, cheaply and properly pulverizing quartz for the stamps. Yours truly, R. P. JOHNSON, Supt. Rawhide Ranch Quartz Mill.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.-This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers. For the present it is not intended to grant licenses for the use of the improved German Barrel, for a longer term than twelve months. All persons desirous of procuring, without having recourse to legal proceedings, for past infringements, or to avoid the same, are invited to apply for the limited period named, are requested to address as below. A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 25th, 1866.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.-This Dry Crusher has been found the most economical and effective mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations afforded on application to the subscribers. A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1866. JAMES BRODIE, Fulton Foundry, or CHAS. OTTO & CO., 312 Bush Street, San Francisco. Express Building, 402 Montgomery street, 12151st

HUNT'S ADJUSTABLE WIND MILLS to have all the sails arranged as turn edgeways to the wind when the mill is in use. The sails can be set at any angle to suit the force of the wind, while the mill is running, by means of the brake lever at the foot of the mill, by any person. HUNT'S SELF-REGULATING MILL is strong, durable and cheap. It is provided with means for stopping, in the most violent winds. This mill is well known throughout the State.

Tread Horse-Powers, Swap Horse-Powers, Pumps in great variety, Single and Double Acting, Frames and Gearing for running pumps, from steam or other power, constantly on hand and built to order. Water Tanks built to order. No. 28 Second St., and 103 and 110 Jessie St., San Francisco. 2415q

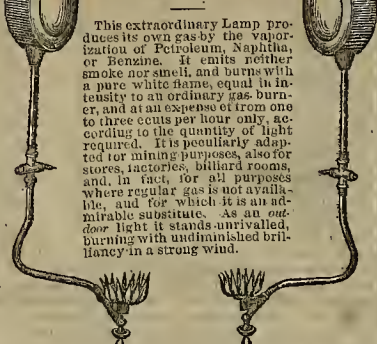

DR. BEERS' PATENT WIRE GAUZE AMALGAMATOR.

THE ATTENTION OF QUARTZ, HYDRAULIC AND Pacer Miners, is called to this new invention for saving Fine Gold. It is designed to furnish the miner with a cheap and simple apparatus by which the dust/fines can be saved without loss, requiring little attention, no machinery to drive it, and will positively collect every particle of amalgam, or of waste mercury that may have escaped from mill or sluice, and as these particles are always charged with more or less gold, this item alone, in many instances, will more than pay the cost of this Amalgamator every month. For Circulars and further particulars, address DR. J. B. BEERS, San Francisco, 111515 6m Per Wells, Fargo & Co's Express.

THE CELEBRATED Self Generating Portable Gas Lamp.

This extraordinary Lamp produces its own gas by the vaporization of Petroleum, Naphtha, or Benzine. It emits neither smoke nor smell, and burns with a pure white flame, equal in intensity to an ordinary gas burner, and at an expense of iron one to three cents per hour, according to the quantity of light required. It is peculiarly adapted for mining purposes, also for stores, factories, billiard rooms, and, in fact, for all purposes where regular gas is not available, and for which it is an admirable substitute. As an outdoor light it stands unrivaled, burning with undiminished brilliancy in a strong wind.

Directions for Use. Charge the reservoir with the prepared fluid, or with Benzine, from half to three-fourths full; allow a pertion to run through into the cup, then turn off the tap and ignite the fluid, which will heat the burner sufficiently to generate the gas, which will be seen issuing from the top. The tap must now be turned on, and a steady light will be maintained till the whole of the contents of the reservoir is consumed. A small needle, bent at the point and fixed in a holder, may be occasionally required to clear the minute hole through which the gas issues, and the regulating screw at the bottom turned a little back; but care must be taken not to force the screw too high, and it should never be used to extinguish the light-by turning the tap off, it will gradually go out. When necessary to renew the cotton which is placed in the lower pipe to prevent the too rapid flow of the fluid, the lamp should be placed in a vise and the burner screwed off. The burnt cotton must then be withdrawn, and a fresh piece of stout cotton rag, one inch wide and four or five inches long, should be doubled over a piece of wire, and inserted into the pipe-the ends cut short off the burner again screwed on with a little white lead, and the lamp is ready for use. Manufactured solely by JOHN J. HUCKS, original proprietor. Factory, North Beach, San Francisco; and for sale by his agents in every city and town throughout the State, 1814-34-5

LEFFEL'S American Double Turbine

THESE WHEELS, UNEQUALED AND UNRIVALED IN THE UNITED STATES or the world, have been fully tested on this coast, more than forty being in use at this date in California and Oregon, driving all kinds of machinery, Saw Mills, Flour Mills, Quartz Mills, etc., etc. CALIFORNIA REFERENCES.-E. Stocton, Polson; O. Simmonds, Oakland, (Mill at Clear Lake); Morgan Coville, Lexington, Santa Clara County; J. Y. McMillan, Lexington, Santa Clara County. Send for Circular, to KNAPP & GRANT, Agents for California, 2513-15q 319 Washington street, San Francisco.

SUPERIOR CUT-OFF ENGINES.

We desire to call the attention of Engineers, Manufacturers, and Millmen, to the celebrated Hartford Engine, With Wright's Patent Variable Cut-off, which we are now manufacturing under a license from the Woodruff & Beach Iron Work Co., Hartford, Ct. To parties wishing a First-class Fuel-Saving Engine,

Simple and durable in construction, this Engine is offered in the belief that it is superior to any other manufactured. It enjoys the very highest reputation in the Atlantic States, where it is well known; over 300 of them having been built by the Woodruff & Beach Company, and being now in successful operation. GODDARD & CO., Pacific Iron Works, 9v151st San Francisco, Aug. 29, 1867.

The Sierra Gordo Mines.

EDITORS MINING AND SCIENTIFIC PRESS: I have been in these mines sometime, having come here from Virginia. They are situated in the Inyo Mountains, a continuation of the White Mountain range south. The distance from Virginia is about 300 miles. The journey from there I made by stage to Independence, which is the county seat of Inyo county, and where there is a military post established. The distance by stage to Independence is 260 miles. From there to Loue Pine, eighteen miles, I came by mule team, and from thence to these mines, twenty-two miles, I came on horseback. The road passes through very productive valleys for the distance of 100 miles or more, called Blind Springs Valley, and Owens Valley. The range of White and Inyo mountains are on the east side of the valley, and the Sierra Nevadas are on the west. The distance of the mining camp from the valley, is seven miles, over a mountain trail. There are no wagon roads in the mines, as yet. Owen's Rivor runs through the valley and empties into Owen's Lake. The mines are west of the lake, which is in sight from the camp. The distance from Los Angeles here is about 260 miles, and from there to San Pedro, twenty miles. The traders have their goods brought in by this route, and the price for bringing freight from San Pedro is seven cents per pound. There is another way to reach this point from the west side of the Sierra, through Walker's Pass by way of Visalia, which is about 180 miles from here. There is a trail leading to Visalia, which makes the distance there only about ninety miles, but which cannot be traveled during the winter season, on account of the snow.

The first mine discovered here was by Pablo Flores, and two other Mexicans. They started from Austin two years ago last March, on a prospecting tour, and traveled southwest over the different ranges of mountains, but did not find any mineral until they reached this place. After they had satisfied themselves that there were rich silver and lead mines here, Pablo Flores' two companions started for Virginia for supplies, and he remained alone at the mines. As they did not return at the appointed time, nor for a long time afterwards, Flores left, on account of being out of provisions, to look for them, fearing that they might have been killed by the Indians. He made his way to Virginia, and could learn nothing of them from his countrymen, and they have not since been seen or heard of. The Indians no doubt killed them. Flores told his friends about the discovery of these mines, which induced many of them to come here with him, and last summer there was quite an immigration of other Mexicans. During the summer and early in the fall several Americans came and located mines.

I am connected with the Sierra Gordo Mining Co., which is about to reorganize under the name of the Virginia Co. The company is not incorporated. It owns claims in a great many different ledges. Some of them contain a large amount of silver, a little lead and copper, and some contain a large amount of lead and considerable silver. The mines generally are of that character. The Mexicans have been and are still smelting ores in rude furnaces, and refining in wasos. They are taking out quite a quantity of bullion; but there is difficulty in disposing of it, and it cannot be sold for coin here, for the reason that coin is not here in quantity. There being no assayer here, the exact value cannot be ascertained, and they are compelled to trade it off for merchandise and provisions at about \$1 per ounce. The ledges already discovered are very numerous and there are many more yet to be found. This is the richest section for mineral that I have ever seen. The mines located are mostly in the hands of poor people, who can work them only in a small way. The prices for them are low, being from fifty cents to \$20 per foot. The ores are mostly of the class that require smelting,

and there is plenty of lead for the purpose of flaxing, although some of the ores can be worked by the ordinary mill process.

I am preparing to erect for the company a furnace for smelting and one for refining, and expect to have them ready in about three weeks. I know of no place on the Pacific coast that holds out so great inducements as this for persons of capital and enterprise, and there will probably be a large emigration here next season. The climate seems to be quite mild and agreeable.

Much of the ore could be conveyed to San Francisco and reduced there at profit, but of course it would be more profitable to work it here. I will not pretend to say what the ores will produce, but I know that they will pay largely. There is an opening here for persons who wish to build roads, work in the mines, put up reduction works, build sawmills, sell goods of all kinds and provisions, for mechanics and artisans, and those who want to speculate in mines and town lots. I may in a future communication give you the result of ore that I shall smelt, cost of mining, smelting and refining. The ordinary spelling of the name of these mines, "Cerro Gordo," is incorrect. They should be spelt Sierra Gordo.

JAMES DELAVAN.

Long Pine Dist., Inyo Co., Nov. 12.

FIVE HUNDRED DANES FOR BUTTE COUNTY.—The Butte County Press, of the 23d ult., says: Some months since we announced that the Mandeville and Solomon tract of five thousand acres of the choicest farming land in the State, a little east of town, had been purchased by the Danish Consul of San Francisco, to be parceled out among five hundred Danish emigrants, now on their way to this coast, and now we take pleasure in further announcing that the bargain was consummated and the transfer made on Thursday last. The emigrants, we understand, will be here in time to put in a crop the ensuing spring. The commodious brick building on Main street, now in course of construction, is designed as a store for their accommodation. An addition to our population of five hundred wealth producers at one dash, is no small item. And when the other large tracts, now held by capitalists, are sub-divided into small sized farms, as they will be at no distant day, Chico Township will be the seat of population and wealth unsurpassed by any other locality in the State.

THE Rev. Dr. Peck, formerly of the Howard Street Methodist Church, in this city, is preparing an original work to be entitled "The History of the Great Republic, considered from a Christian standpoint."

DEPOSITS RECEIVED IN SUMS OF \$1 AND UPWARDS. We will keep safely all bonds deposited with us; collect and remit the interest to our friends in the country, as may be directed. For further particulars, address FARMERS' AND MECHANICS' BANK, 2v15-6mew San Francisco.

WHITING & BERRY,

Teas, Wines, and Spirits, For Medicinal and Family Use. APOTHECARIES, PHYSICIANS, Invalids and Families, supplied in quantities to suit, at WHOLESALE AND RETAIL, WITH Fine, Medium or low-priced qualities. No. 609 Sacramento street, two doors above Montgomery, SAN FRANCISCO. 1v15

Pratt's Abolition Oil.

FOR ABOLISHING PAIN—THE BEST REMEDY IN existence for Rheumatism, Neuralgia, Paralysis, Headache, Toothache, Sore Throat, Ophthalmia, Weak Swollen and Still Joints, Contracted Cords and Muscles, Cramps, Colic, Ovarian, Cholera, Pains in the Breast, Lumbar Back, and all aches and pains. It is the poor man's friend, and the best family physician. Full directions accompany each bottle. Price 50 cents and \$1 per bottle. For sale by all dealers in medicines. Sole Proprietors, A. McBOYLE & CO., Organists and Chemists, 52 & Sacramento street, opposite What Cheer House, San Francisco. 1v15-1y

Assayer and Chemist.

A GENTLEMAN WELL VERSED IN ASSAYING AND Analytical Chemistry, is desirous of securing a position in some assaying establishment, or would take charge of the assaying and amalgamating department of either a gold or silver mine. Steady employment, rather than high wages, is desirable. The advertiser would take his own laboratory to the mine if desired. Proper references given. Inquire at this office. 3v15tr

Quartz Mill Construction and Superintendence

THE UNDERSIGNED IS AT PRESENT OPEN FOR AN engagement as a working Superintendent in the construction or operation of a quartz mill. Has had five years steady and successful experience in working ores in Washoe, and is practiced in saving sulphurets and the treatment of rebellious ores. Is prepared to furnish references for all the necessary qualifications of an intelligent, faithful and reliable quartz operator. Address P. M. SHAW, San Francisco, care Mining and Scientific Press. 2v15-13m

Economy in Advertising.—The Mining and Scientific Press is the best and most economical mining advertising medium in this city. Our terms are less than ONE HALF the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The Press contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

HAYWARD & COLEMAN, IMPORTERS AND REFINERS OF Illuminating, Lubricating, PAINT OILS!

CONSISTING OF KEROSENE, LAMP, SPERM, ELEPHANT, POLAR, TANKERS', NEATFOOT, BOILED AND RAW LINSEED, CASTOR AND CHINA NUT.

SPIRITS OF TURPENTINE & ALCOHOL

NOTE.—We would specially call the attention of MILL owners and Engineers to our superior PARAFFINE OIL, which we manufacture from the California Petroleum. This oil will not gum. Machinery thoroughly cleaned and lubricated with it will not heat, and after remaining at rest, can be started without cleaning out. A sample can of our Paraffine Oil will be forwarded on application to us, as we desire a fair and impartial trial.

Lamps and Lamp Stock!

An elegant and complete assortment on hand. 1v13-3m 414 Front street, San Francisco.

NEW YORK PRICES. WATCH REPAIRING AT NEW YORK PRICES. C. E. COLLINS, No. 603 Montgomery street, San Francisco. EXCLUSIVE AGENT FOR THE AMERICAN WATCH FACTORY. A large assortment of those Superior Watches. In Gold and Silver Cases, Constantly on hand, and sold at Factory prices. Also, ENGLISH AND SWISS WATCHES, Imported directly from the Manufacturers. The American Company are now making VERY FINE WATCHES FOR LADIES. A large assortment of Gold Chains and Jewelry. 12v10-6m NEW YORK PRICES.

WE ARE NOW OFFERING OUR IMMENSE STOCK

Fine Custom Made Clothing

Gents' Furnishing Goods AT PRICES THAT DEFY COMPETITION. Our Stock of Clothing Consists of ALL THE LATEST STYLES BOTH OF MATERIAL AND FINISH.

A Large Assortment of Trunks, Valises, Carpet Bags, Blankets, Etc., AT EXTREMELY LOW PRICES. J. R. MEAD & CO., 8v10 Cor. of Washington and Sansome streets

TO SPORTSMEN.

THE UNDERSIGNED, HAVING BEEN APPOINTED Sole Agent for the Pacific Coast for the sale of ROBB'S BREECH-LOADING SHOT GUN, which discharges four shots in two seconds, circulars will be furnished by applying to or addressing HENRY ETEL, 111 Second street, Or Lock Box 1172 P. O., San Francisco. 18v15-2m6m

Administrator's Sale.

NOTICE IS HEREBY GIVEN, THAT IN PURSUANCE of the order of the Probate Court of the City and County of San Francisco, in the State of California, made on the twenty-first day of November, A. D. 1887, in the matter of the estate of HENRY GANALL, deceased, the undersigned, Administrator of said estate, who sell at public auction to the highest bidder, for cash in hand, in one parcel, and subject to confirmation by said Probate Court, on MONDAY, the sixteenth day of December, A. D. 1887, at twelve o'clock M., at the auction rooms of Maurice Doro & Co., No. 827 Montgomery street, in said City and County, all the right, title, interest and estate of the said intestate, at the time of his death, and all the right, title and interest that the said estate has, by operation of law or otherwise, acquired there or in addition to that of the said intestate, at the time of his death, in and to all that lot, piece or parcel of land, situate, lying and being in the said City and County, and bounded and described as follows, viz: Commencing on the southerly line of Bush street, distant 137 feet 6 inches west-streets thence running westerly on said southerly line of Bush street 137 feet 6 inches; thence at right angles southerly 137 feet 6 inches; thence at right angles easterly 137 feet 6 inches; thence at right angles northerly 137 feet 6 inches, to the southerly line of Bush street, the point of commencement, being 53-vara Lot No. 1, 1857. LINDSEY D. SMITH, Administrator of the estate of Henry Ganall, deceased. 2v15-1w Dated, November 21, 1887.

Mechanical Drawings.

Persons wishing Mechanical Drawings can obtain the services of competent draughtsmen, by applying to this office.

Machinery. NOTICE TO MERCHANTS AND MANUFACTURERS.

Moore's Patent Friction Hoist.

Now in successful operation in the principal stores in San Francisco, possesses many advantages over the common hoist—viz, greater strength; less danger in working, as goods require no slinging or lashing, consequently make fewer breakages; requires one man less to operate it; stops with the load at any point, without any starting or attention from the operator.

The undersigned take this opportunity to notify all whom it may concern that they have secured, by letters patent, the application of a friction hoist, or stop, to hoisting machines, and that they will prosecute any party making or using any machine infringing upon the same.

VULCAN IRON WORKS CO., By JOHN MOORE, President. JOSEPH MOORE.

BLAKE'S PATENT QUARTZ CRUSHER.

CAUTION! The owners of the Patent for this valuable machine, in order to facilitate the protection of their rights against numerous infringers, procure, at some time since, a reissue of the Patent, bearing date January 9th, 1886.

This Patent secures the exclusive right to employ in Stone-Breaking Machines Upright Convergent Jaws, actuated by a Revolving Shaft.

All persons who are violating the Patent by the unauthorized making, selling or using machines in which quartz or other materials are crushed between upright convergent jaws, actuated by a revolving shaft, are hereby warned that they are appropriating the property of others, and they will be held responsible in law and in damages. Several infringing machines are made and offered for sale in this city, upon which Patents have been obtained. Manufacturers, purchasers and users, are notified that such Patents do not authorize the use of the original invention, and that such machines cannot be used without incurring liability for damages. BLAKE & TYLER, Agents for the Pacific Coast. 14v14tr

Notice to Miners, Well-Borers and Water Companies.

M. PRAO IS NOW PREPARED TO MANUFACTURE Hydraulic and Artesian Well Pipes in the best workmanlike manner, and at the lowest market rates. Having made large additions to my stock of machinery for this branch of business, I am prepared to fill all orders with dispatch, and guarantee entire satisfaction. I also manufacture Mississippi Stoves, of the latest improved patterns, for vessels of all classes. Also, Slip Plumbing done. M. PRAO, 8v13-1y Stove Store, No. 125 Clay street, below O'Connell.

ELLERY'S Patent India Rubber Paint and Cement

Is composed of India rubber and other gums, dissolved in pure linseed oil, mixed with the various coloring matters, and ground in any color. We paint Wood, Brick, Metal, Cloth, etc. It is a superior Marine Paint. Will not rot, peel, blister or crack in any climate. Fifteen hundred Fish Ball Vessels at Gloucester, Mass., use it as superior to other paints. We refer to Steamers America, Senator, Paul Fry, Julia, etc., and W. K. Van Allen, S. C. Bugbee & Son, Tubbs & Co., C. W. Thomas, Sidney Johnson, Dr. Heuston, Gen. Connor, Stockton, H. L. Davis, Jas. Lick, J. P. Pierce, Esq., and others. Filbert Street School House, two coats on redwood, equal to three coats lead. One hundred pounds paint equal in bulk to two hundred pounds lead. Cementing and painting new or old Tin or Metal Roofs. We first cement around the eaves and skylights all holes and cracks, then apply a good coat of paint. A good, clean, tight roof is certain. Price, from one to three cents per square foot, according to size and condition of roof.

New Cloth Roof put on, saturated with liquid rubber; then painted at nine cents per square foot. We use none but the best materials and pure linseed oil. No lead turpentine, neither asphaltum or coal tar. Also, for sale, "Submarine Rubber Varnish," \$5 per gallon; any color. We will apply to Vessels' Bottoms, or furnish at \$5 per gallon. 2v15tr

Pacific Powder Mills.

SUPERIOR BLASTING AND SPORTING GUNPOWDER:

- Black Olinmond, in 1/2 canisters. do do in 3/4 canisters. do do in 1/2 kegs. Hunter's Fric, in 1/2 canisters. do do in 3/4 canisters. do do in 1/2 kegs. do do in 3/4 kegs. Pacific Mills River Shooting, in 1/2 canisters. do do in 3/4 canisters. do do in 1/2 kegs. do do in 3/4 kegs. Pacific Mills Rifle, in 1/2 canisters. do do in 3/4 canisters. do do in 1/2 kegs. do do in 3/4 kegs. do do in 2 1/2 kegs.

Blasting and Mining Powder \$2 50 per keg. Safety Fuse and Shot for sale by HAYWARD & COLEMAN, Agents. 2v15-3m 414 Front street, San Francisco.

It is a Fact,

That BOWMAN'S AMERICAN WASHING COMPOUND is the best article for Washing and Cleaning yet discovered. It is acknowledged to be a saving both in money and labor. As the Compound softens the dirt, the clothes require not more than one-half the rubbing necessary in washing by the old method; besides all who give it a trial acknowledge that their clothes are whiter in washing with this Compound than they were ever known to be by using any other preparation. For washing woolen goods and flannels, it cannot be equalled. Clothes that cannot be washed with soap without fading are washed in the water used for boiling white clothes. This Compound has been used in the Eastern States for the past three years, with perfect success.

WARRANTED NOT TO INJURE THE CLOTHES. For sale by all Grocers. LYNCH & PARSONS, Agents, 14v15-3m 223 Jackson street, near Battery.

Coppers! Coppers!

75,000 LBS. IMPORTED COPPERAS-SULPHATE of Iron—for sale in lots to suit, by BENJ. BRADY, 103 California street, S. W. corner Davis, up stairs. 13.15.3m

**TOBACCO.**—The American people are wedded to no habit more firmly than that of using tobacco in its various forms, and as a consequence, we find that frequently a poor man will spend his last quarter for a bit of the precious weed when he does not know from whence his next meal will come. The habit is one that grows upon the consumer, and the longer he uses the "weed" the harder it is to break off the habit. Webster says that the practice of using it in any form soon conquers distaste, and forms a relish for it that is strong and almost unconquerable. That its use is injurious to health, there is no doubt, besides its accompaniments are filthy in the extreme. The good it does can never overbalance the bad, although some consider it the sweetener of each day's toil. No remedy has been discovered for its use, other than the will and resolution of the person using it, until Messrs. Traver Bros., of this city introduced their antidote for the evil, which is said to completely eradicate all taste for it. We would recommend its trial by all who use the "weed."

**NEW INCORPORATIONS.**—Articles of incorporation have recently been filed in the County Clerk's office in this city as follows:

**SAN BRUNO HOMESTEAD ASSOCIATION.**—San Francisco, Dec. 10th. Capital stock, \$80,000; 200 shares, \$400 each. Trustees: J. W. Reay, William Douglas, R. W. Coffin, A. Bryan and James Johnston.

**ELECTION OF OFFICERS.**—CALIFORNIA TRUST CO.—San Francisco, Dec. 7th. President, Henry L. Davis; Cashier, DeWitt C. Thompson; Auditor, Thomas B. Ludlum.

**LUMBERERS' AND STEVEDORES' ASSOCIATION.** San Francisco, Dec. 3d. President, John Casey; Vice President, John Odyke; Recording Secretary, Stephen White; Financial Secretary, Edward T. Ackland; Treasurer, Charles Kirstein; Board of Trustees: Michael Ford, Duncan McDonald, Richard Welch, Daniel Logan, Patrick McFadden and Edward Sadler; Sergeant-at-Arms, John Russell.

**COLE S. M. Co.**—San Francisco, Dec. 11th. Trustees: R. S. Eells, Thos. S. Eells, Geo. D. White, Josiah Stanford, Jno. S. Eells, A. P. Stanford and J. H. Stoutenborough; Secretary, John W. Allyn. Office, No. 404 Montgomery street.

**INDIA RUBBER PAINT.**—We would call attention to the fine double house on Capp street, near Center, residence of C. V. Stuart, Esq., as a fair sample of painting with Ellery's patent india rubber paint. The paint is undoubtedly a good article, and the materials, india rubber gums, pure linseed oil, and coloring materials, all of the best. Call and see their works, corner of Battery and Jackson streets.

**BUSSEY'S LOCK.**—Attention is called to the advertisement of W. C. Bussey's Keyless Combination Lock, in another column.

**TO SOLICITORS OF PATENTS.**

County, ... State. ... 186-"

**CHALLENGE FOR TWO THOUSAND DOLLARS,**

—AND THE—

"GOLD MEDAL."

**THE EXCELSIOR PUMP COMPANY**

Hereby challenge Mr. THOMAS HANSBROW in the above amount, to a Mechanical Trial between his "Challenge Pump" and the "Excelsior Pump," the trial to take place in San Francisco, before a

**COMMITTEE OF MECHANICS,**

Each Pump to be constructed in accordance with its patent, and to be tested from their least to their greatest capacity, together with the power required by each Pump. A meeting for settling arrangements for the trial may be had at the office of the MINING AND SCIENTIFIC PRESS. This Challenge open for sixty days.

**The "Excelsior Pump"**

Was not entered for the GOLD MEDAL, at the recent State Fair, as it was verbally agreed, by Mr. Hansbrow and Mr. Hooker, that they would not enter their Pumps for the Medal, as no means were provided for testing machinery, and believing that

**Policy, not Merit of Machines,**

Was to govern the award of prizes. The inference is clear—hence the above Challenge.

## A New Pump or Water Lifter.

Many of our readers will, no doubt, readily call to mind, in the accompanying illustration, the new pump or water lifter which attracted much attention at the State Fairs at Sacramento, held in 1866 and 1867. Very few of the visitors at those exhibitions, we presume, were able to form any intelligent idea of the mechanism of these pumps, known as "Wilcox's Patent Water Lifters," unless they previously had some practical acquaintance with the invention. We have several times had occasion to refer to this novel and useful invention, and in our notice of its exhibition at the last State Fair

Fig. 2 shows the internal arrangement of parts; *P* is a float fitting loosely into the receiver, and acts as a floating partition between the steam space above and the water space below it, and rises and falls as water is alternately received and discharged. *R* is a rod passing loosely through the float, and is attached to the steam valve *O*. The valves of the supply and discharge pipes are seen at *m* and *n*. The mode of operation is as follows: Supposing the pump to be filled with water—the valve *n* being closed—steam is admitted through *i* and the pressure forces water out through *b*. The float *P* is lowered by the pressure of steam and discharge of water until it strikes the button on the lower end of the rod *R*, and brings the valve *O* down, cutting off the steam entrance *i* and opening the passage *H H*. Steam is then passed from the receiver through *H H* into

quires no engine, no piston, no plunger nor gearing of any description, consequently it is without the friction incident to those attachments; its economy in steam, using both the expansive and exhaust power; in other words, it uses the same steam twice instead of once, and receives it direct from the boiler by a pipe; it will work sandy or muddy water without the slightest injury to any of its parts; it is light and easily placed in working position, and requires but little space.

It may be made of any size and capacity required, and its working height is limited only by the strength of the boiler used. For mining purposes, it is adaptable to shafts and tunnels, whether perpendicular, horizontal, or at any angle. For basins to be prospected, or where tunnels have been run too high to drain them, this pump can be used to great advantage, from its indestructibility by grit, and the large quantity of water it will raise.

It is claimed by the proprietors that these pumps will raise more water, with the same amount of steam, than any other in use. We are not aware, however, that any carefully conducted experiments have been undertaken to verify this assumption; although there is certainly an apparent great economy of steam in the invention. By a cut-off attachment, which might be readily affixed, the economy might be made still greater. The steam is used direct, with a mere moiety of the friction due to an engine, and the action of the pump, as witnessed at the last State Fair, was all that could be desired for such work. The pump is extremely simple, and so easily understood that a child can manage it. We have been shown certificates of the highest character of their use in this State, both for mines and for irrigating purposes, where they have been subjected to continuous work, with the most gratifying success. They have been employed in California to raise from 1,000 to 3,000 gallons per hour, and can, with equal facility, be constructed to raise 15,000 gallons in the same time. They can be made double-acting if desired.

By a slight modification in the arrangement of the valves, making the supply and exhaust pipes horizontal in position, instead of vertical, this pump might be most advantageously applied to the propulsion of boats on the hydraulic principle, as applied to the English steamer Water Witch, and as by a modification of that principle proposed by a San Francisco inventor. The inventor has placed in our hands a drawing of such modification, which is subject to the inspection of any who may be interested in such a device. For further information see the advertisement of M. & A. Wilcox, which will appear in our next issue.

NEW EXPRESS COMPANY.—The "Pacific Union Express Company" has filed its certificate of incorporation. It has been formed for the purpose of carrying on a general express business in the United States and territories and foreign countries. Its principal office will be in this city. The proposed capital is \$3,000,000.

WOOD PRESERVING COMPANY.—A company has been formed with a capital stock of \$320,000, to engage in the preserving of wood after the patent of Mr. Samuels, which has already been described in this paper.

THE STATE GEOLOGICAL SURVEY.—We regret to observe that one of the newly elected members of the Legislature, Mr. Pendegast, has given notice of a bill for the discontinuance of the State Geological Survey. Of course the bill will find but few supporters among such an intelligent body of men as compose the present Legislature of California. To abandon the Survey at the present time, would be the infliction of a grievous wrong upon the State and the cause of Science throughout the world. An immense amount of valuable statistics, and other information with regard to the mineral resources, geology and topography of the State has been collected, at great cost, which would be virtually abandoned and lost by the passing of such a bill. There may be need for retrenchment; but this would surely be the most expensive way of saving the people's money. Mr. Pendegast represents Lake, Napa and Mendocino—agricultural counties. Surely the people of those counties cannot approve of such a course on the part of their representative. We hope to see, on the other hand, a liberal appropriation, such an one as will enable the Survey not only to finish, as speedily as possible the publication of data already collected; but also to go forward with increasing zeal, in the important work of gathering still more for future publication.

METALLURGICAL WORKS.—It will be seen by reference to our advertising columns, that Mr. Chas. Balbach & Brother, for many years connected with the Metallurgical Works of Newark, N. J., have opened a branch establishment at 315 Howard street, in this city, for assaying and working all kinds of ores, more particularly of gold and silver and their sulphurets. They are also agents of Edward Balbach's patented process for separating gold and silver from lead, which is represented as having been in successful operation for nearly three years at their works in Newark, N. J. It is claimed that by this method the expensive and tedious process of "cupelling" is avoided—better results, even, being reached with a great saving of time, labor, fuel and metal. From one to four per cent. of zinc—according to the richness of the lead—is used, which is subsequently returned to the metallic state in a few hours, to be used again in a similar way. We hope to see this new process tried soon, on some of our rich argentiferous lead ores.

WILCOX'S PATENT PUMP AND WATER LIFTER.

promised an illustrated description of the same. We are now enabled to redeem that promise in such a manner that we presume all our mechanical readers will be able to gather a perfectly intelligent and correct idea of this novel steam pump, which works without engine, piston, plunger, or hockets. As will be seen, it uses steam direct from the boiler, as does also the steam syphon pump, but with a much greater amount of economy. The former, however, is designed to be used chiefly in cases of emergency, and is not constructed with a view to economy, which last consideration is one of the chief claims of the Wilcox lifter.

Its construction and operation will be understood by reference to the accompanying engraving. In Fig. 1 *a* represents the receiver or cylinder in which the steam is applied, *f* the supply or suction pipe, *b* the discharge, *c* the condensing chamber, *d* and *s* valve chambers, *t* and *K* capped openings for access to valves, *g* the case or hocket containing the steam valve. Steam enters at *i* and exhausts through *H*.

*c* and instantly condensed. The vacuum thus formed constitutes a suction or draft by which the receiver is again filled from below. As the receiver fills, the float rises, and striking the upper button on the rod *R*, raises *O*, cuts off passage *H H*, lets steam in again from *i*, and thus continually repeats. The float being used to fill an intervening space between steam above and cold water below is made of such length as not to allow the steam to come in contact with the same parts as does the cold water of the supply, but preserves as neutral space one-third or more of the length of the receiver. The water surrounding the upper end of the float being once heated does not pass off into the discharge, but retains its position, rising and falling with the float, which, acting as a valve to the passage beneath, cuts off the discharge of water at the same instant that its own motion is stopped, thus retaining the water surrounding its sides. No cold water is allowed to enter the upper part of the receiver.

Its merits, which are considered as especially worthy of consideration, are enumerated as follows by its inventor: It is exceedingly cheap and simple in its construction, and not liable to get out of order; it re-

## Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

(Written for the Mining and Scientific Press.)

### The Freiberg, or Barrel Process, for the Reduction of Gold and Silver Ores.

BY PROF. ROWLANDSON, F. G. S. L.

NUMBER FIVE.

#### LOSS OF BULLION INCURRED BY DIFFERENT PROCESSES.

In the first place will be taken into consideration the losses incurred by the older processes of amalgamation, and compare the same with the recently introduced pan method, afterwards attempt an approximate estimate of those which take place with the recently introduced humid modes.

The Real del Monte Co., Mexico, have for several years been in the habit of keeping a very correct account, not only of the cost attendant on the reduction of particular ores by various methods, but classifying the different charges, which are again subdivided to such a degree that in the tabulated results are to be found inserted single items so low as four and five cents per 3,000 lbs. of ore. Unfortunately, however, these accounts, when they come to describe the losses of bullion, owing to imperfect extraction or otherwise, are not efficiently definite to remove all grounds for dispute. I name this fact because what will hereafter be stated may possibly be based on a serious fallacy.

The accounts alluded to give the respective amounts of silver left unextracted by the several methods which I am about to describe, as follows: Smelting, six per cent.; patio amalgamation, 15 per cent.; the average of three Haciendas by the Freiberg barrel, 18 per cent. By the Washoe pan process, admitted to be 35 per cent!! The uncertainty attached to the preceding account of the percentage of bullion unextracted from the ores of Real del Monte, arises from the non-statement whether such estimate is based on the assay of the raw ore, or only applies to the residuary matters after treatment. For reasons which will be briefly given, I have assumed the former opinion to be the true one. In the first place, the loss amounting to six per cent. of the silver, when treated by smelting, is a very heavy one, and clearly displays the rude manner in which this mode is executed at those mines. Secondly, the loss described as attending the barrel mode is very much heavier than that which occurs in Germany, including the loss of silver sublimed during the preparatory furnace work, unless both the sources of waste alluded to were included in the estimate, otherwise the loss sustained by the harrel process of Rio del Monte would exceed thirty per cent. instead of eighteen. Such a very great loss as that last supposed would be the more surprising, as, in place of scrap iron as used at Freiberg, at Real del Monte small copper balls are employed for the purpose of effecting the dechlorization of the chloride of silver, the superiority of which metal over that of iron for this purpose is well known; therefore, I do not think I can be very far wrong in attributing the total loss at only eighteen per cent., as that would only exceed by three per cent. the loss sustained at Freiberg when the same process is employed.

I was always inclined to the opinion that the loss sustained by the patio process was in a large measure attributable to the losses sustained by the drainage or seepage of mercury and amalgam through the floor of the "torta," and to a considerable extent I suspect such a loss must occur for some time after operating on a newly formed floor. Recently, however, a gentleman informed me that when an attempt was made to introduce the patio mode at Washoe, the heap or torta was formed in a large wooden vessel perfectly impervious at the joints or

through the pores of the wood, and that consequently no loss could occur through seepage; that the losses sustained occurred in consequence, as my informant described it, to the impossibility of agglomerating the "floured mercury."

Respecting the attributed source of the evil I am disposed to concur, but I suspect it was caused by phenomena of a different character to that to which my informant attributed it, viz: the extreme divisibility of the mercury or amalgam. This extreme divisibility, as is well known, is obviated to a great extent by prolonged motion of the pulp after being sufficiently attenuated to promote the desired aggregation. Why this remedy was found so very ineffective in the case under notice, arose most probably from the fact that a large part of the so-called floured mercury existed not in the metallic form, but as a dichloride (calomel) not simply uncombined, but probably as a double or even poly-chloride or dichloride in which either iron, copper or silver, either as a chloride or dichloride may singly or in conjunction combine with the mercury in this state, so as to form that extraordinarily impalpable combination, the floating away of which occasions so much loss, not only of mercury but of bullion, also. This theory has never previously been published, and only occurred to the writer in consequence of the conversation above alluded to; its correctness, however, is in a great measure corroborated by what occasionally occurs in patio amalgamation, in which it is found that when on examining the "torta" that the mercury is in an extremely divided state, and of a dark color, with occasional brown spots, it is said to be too hot, and if the operation was allowed to proceed, a very large loss of mercury would occur along with a more than ordinary incomplete extraction of the silver; the remedy for the cure of the malady is lime. Lime so applied, however, will not heal the injury which had previously taken place, the benefit would merely result afterwards. For a similar purpose lime has been used with like good effect in pan amalgamation. These last named remarks are worthy of being noted as they are not only suggestive of probable sources of loss in amalgamating processes, but may also tend to lead to the introduction of preventatives, palliatives or cures which it would not be difficult to arrive at by *a priori* reasoning if the theory above set forth is based upon fact.

This lengthened notice of the patio process is not written for the purpose of inducing the reader to infer that such a course of proceeding is what the writer would recommend as being the most economical; however, as many of the phenomena relating thereto are more or less associated with every variety of amalgamation, I have thought fit to dwell upon and explain several points under this head. If otherwise desirable, the patio method could only advantageously be followed at Washoe for three months of the year, during which limited period the process would be greatly retarded by the coolness of the nights, during no inconsiderable portion, even, of that brief term. One of the most important practical facts connected with the discussion of this part of the subject, is the circumstance that the Washoe pan method of amalgamation occasions a loss of bullion equal to one hundred and thirty-three per cent! beyond what takes place by the old, or what is commonly called the rude patio method.

#### MISCELLANEOUS OBSERVATIONS.

It would have been well if a concise statement could be made of the relative cost of each mode of reducing the ores of the precious metals, as well as the details respecting the losses of bullion inseparable after each method. On reviewing the whole subject, however, what with the fact that the chemical modes, which have never yet been attempted on any scale on this coast, and the cost of fuel, labor, etc., varying so much from what occurs in Europe, it is impossible to draw anything like a correct comparison. I have found it impossible to draw an estimate other than an approximate one. For similar reasons I have refrained from reviewing in detail, as I originally intended, the losses connected with the various modes of extracting the precious metals by the humid methods, on which points the reader is referred to what has been stated in former portions of this series. As far as I can ascertain, the average losses on Augustin and Ziervogel, do not vary much, the advantage being rather in favor of the latter, when very pure mats are treated, but in favor of the former when arsenic or antimony, or both, are present, according to which conditions the losses on account of non-extraction vary from two to eight per cent. of the bullion in the ore. As, however, metals become, in the course of this preparation, considerably purified from many matters that otherwise would be

noxious, a comparison made between sulphureted mats and ordinary ores, would by no means be a fair one, even though the latter should, by concentration or otherwise, be brought up to an equal standard of production. After summing up in my next paper my reasons for recommending the harrel process, or something of an analogous character, as being best adapted to all the circumstances and conditions at present attached to gold and silver extraction on this coast, I shall attempt, briefly, to explain in what cases, probably, the more modern or humid methods might either wholly or in part be employed.

As an instance of the difficulty attendant on arriving at a proper estimate of the various modern methods just alluded to, reference may be made to the instance of Patera, recently cited by Mr. Kustel in the current volume of THE MINING AND SCIENTIFIC PRESS, page 323, wherein it is stated that on an experiment on five tons of ore, a clear profit was obtained of seventy-five florins, by the hot brine and chlorine method, as compared with that of amalgamation. This would be a saving at the rate of fifteen florins per ton.

Presuming silver, not currency florins, are meant, the difference between the two methods would amount to seven dollars and one half per ton. This great discrepancy could not be, on account of the charges incident to each being so greatly more in the one case than the other, because up to the time for employing either brine or mercury the cost would be identical, and the subsequent charges on either must fall very much below the sum named. Consequently it is a fair inference that the difference of profit claimed by Patera must be wholly due to the more perfect extraction of the precious metals. Mr. K. relates that Patera has stated that all the copper (does not say what percentage,) was obtained, 98.94 per cent. of silver, (present in the ore, it is presumed,) and nearly all [the] gold.\* Such a great discrepancy can only be accounted for by the fact that the comparison so made was with an ore very unfitted for ordinary amalgamation, and probably was originally composed along with the ordinary gangue, of sulphides of copper, iron, antimony and lead (galena,) with possibly more or less of the sulphide of zinc (blende,) and arsenic combined with iron, a species of ore which, it is well known, is peculiarly unfitted for amalgamation with mercury. In the one case nearly all the bullion must have been obtained from the roasted ore, in the other fifteen per cent., at least, must have been lost, the latter being more than double the amount lost, even by badly executed barrel amalgamation. The last fact, alone, affords tolerably good testimony that the ore may either have been unfavorable for amalgamation, or like the Mansfield mats, the treatment of which, by Ziervogel's method, has previously been described at considerable length, the greater part, or even more than the whole of the saving may possibly be comprised in the article copper, especially as all that metal present in the wasted ore is stated to have been obtained by the hot brine method.

In the forthcoming work of Mr. Kustel, that gentleman will, it is hoped, fill the brief omissions here alluded to. It would also be an acceptable piece of information if Mr. K. could, at the same time, furnish more specific details respecting Patera's and Roesner's trials with hot brine and chlorine.

**A NEW MINING REGION.**—A Milwaukee newspaper speaks of important discoveries on the northern shore of Lake Superior. The Indians and trappers of this region have often brought pieces of silver ore into the settlements. This has given rise to a general belief that when the shore should be thoroughly explored, deposits of this precious metal would be found. This isolation and ruggedness of the region, however, have discouraged private enterprise, and the peculiar land policy of the British Government has prevented the formation of mining companies. Veins of ore have been profitably worked at the mouth of Pigeon River and on Prince's Bay, but elsewhere little or nothing has been done until within a year past. It is about a year since a Mr. McKeller, of Ontonagon, discovered indications of a silver deposit at the head of Thunder Bay. This summer other persons have prosecuted the search, with very favorable results. Two veins have been found carrying paying quantities of native silver, and several others bearing "silver lead." One of the veins with native silver also carries a notable quantity of argentiferous sulphuret.

It is said that there are three extinct volcanic craters near Red Mountain City, in Montana, which are so deep that the light is entirely excluded from their depths, and that when a stone is thrown into them, no sound can be heard of it reaching the bottom.

### 'Formation and Distribution of the Igneous Rocks.'

MESSRS. EDITORS:—I have noticed with pleasure the recent conclusion in your paper of a series of articles upon the Formation, Distribution, etc., of Igneous Rocks; and as the writer now invites comment and suggestion, with the intention of hereafter republishing the paper in another form, I am tempted to say a few words in the hope of inducing him to spare the public a useless infliction, and himself a useless expenditure. Curiosity led me to read the first of the articles to see if it contained anything new; and curiosity has since led me to glance at the others, to see if they contained anything probable or plausible. I have been able to discover neither the one nor the other. I cannot attempt to review these articles and point out their errors, for the latter are strangely numerous, and of a character which the veriest matterer in chemistry and geology should be able to detect.

The writer has endeavored, he says, to present the plan of the distribution of igneous rocks in such a manner that all may comprehend it. It is a pity that instead of this, he should only have succeeded in presenting something which neither chemist, geologist nor miner can comprehend at all, and which contains less truth and information than any other communication of equal length lately offered to the California public. I think the most valuable suggestions which can be made to the writer are: obtain a text book of chemistry and a small but reliable one of the outlines of geology. When he has really mastered the first principles of these subjects, it may be well enough for him to dip, if he likes, into the more comprehensive works of Dana, and others, and it will be time enough after that for him to elaborate new theories of the distribution of rocks and the formation of mountain chains. Long before he reaches this point, however, if he follows the course here indicated, he will have abandoned his pet theory of "erupted quartz," and some other things in connection with it.

These suggestions are made in a spirit of kindness to the writer himself, as well as to the public; and if they seem severe, it must be remembered that it is difficult to be other than severe in speaking of the presentation of absurdities to the scientific world, at the present day. CRITICUS.

**FURTHER experiments,** and on a much more extensive scale than any hitherto undertaken, are about being carried out with regard to the use of petroleum for generating steam. The steamship *Island City* is being fitted at Boston with Foote's apparatus for burning petroleum, for the purpose of making a trans-Atlantic trip to further test the merits of the invention. The *Island City* will take on board a supply of fuel for an extended trip, and will visit New York, Philadelphia, Baltimore and other Atlantic ports, and then make the ocean trip. The liquid fuel for this proposed trip will be confined in iron tanks, and the displacement in the vessel by it will be very small.

**LARGE IRON FURNACES.**—Some months since we made mention of several monster iron furnaces then in process of erection in England. Their success was considered by many as problematical. These furnaces were finally completed and have proved all that their proprietors anticipated. Player's monster furnace at Norton, produces one ton of foundry iron to one ton of coal, the ores yielding only 30 per cent. The furnace which yields such an enormous amount is 27 feet high and 103 feet high. In this country a yield of one ton of iron to two and a half tons of coal from 50 per cent. ores is often considered a good result.

**Hops.**—An Englishman at Los Angeles, engaged in the culture of hops, says that this is the best country in the world for raising them—and he has spent a lifetime in the business in Europe, Australia and America. He had some trouble in finding a purchaser in San Francisco for his first bale of hops. He finally disposed of it, and the brewer who used the hops offered five cents above the market price for all he had for sale of that quality.

## Mechanical.

## Proportions in Machinery.

Every experienced engineer—to take steam engines as a sample—has noticed frequently, or repeatedly, that while one engine developed its full amount of power, or that quota which was expected of it, another, built after the same patterns, with the same tools, and by the same workmen, failed to fulfill the design of the constructor.

Sometimes it is difficult, if not impossible, to account for these differences, but it is noticeable that they are the more marked as the machinery is the more complex, so that it is natural to suppose that there is, somewhere in the details, a difference of construction, otherwise we must impute the variation to some mysterious agency whose operations are irremediable by mechanical skill. But even when the machine or implement is simple in its parts and built after unvarying gages, the difference may occasionally be detected. The little pocket pistol which may be one of thousands built by the same machinery and workmen will, in some cases, differ widely in its execution from others of the same lot, when a careful comparison fails to detect the reason. That there must be some variation either in quality of material or construction, the mechanic is assured, but he may not be able to ascertain what it is. Sometimes, however, the cause of difference may be detected. A case in point, which we remember, was that of two locomotives running on the same road, the machinery being so nearly alike that their parts were interchangeable, yet which differed widely in their respective performances. Repeated examinations of the working parts failed to reveal the cause. The engineer of the inferior machine spent many hours in "tinkering" and "coaxing" his engine, yet still it refused to perform the work of its mate. As a last resort he measured the apertures of the exhaust pipes on both engines, and found that while those of the rival machine measured one-and-a-quarter inches, his measured one-and-three-eighths inches. The pipes being of copper, he "drew in" those of his engine one-eighth of an inch, when it performed even better than the other, owing, undoubtedly, to the better care which had been taken of it and its more perfect condition. The difference in the diameter of these pipes was but a trifle, yet no doubt it was the reason of the variation in the work of the two locomotives.

So it may be often that a slight change in the proportions or the actual dimensions of parts may insure evenness and accuracy where the divergence and uncertainty may have been remarkable and mysterious. To ascertain and remedy these points of difference is the province of the intelligent, practical, and educated mechanic. Exactness and accuracy in tools and educated skill are the true remedies for these difficulties. There is nothing about these differences which need be mysterious or undiscovered.—*Scientific American*.

**AMERICAN MACHINERY ABROAD.**—The American machinery at the Paris Exposition has attracted a great deal of attention, and a correspondent of the *London Herald* pays a high tribute to American mechanical genius. In a long letter of three columns he says, among other things:—"It is an absolute pleasure to find one's self on the American ground. The contributions from the great and powerful country formed by the United States, and transmitted across the wide Atlantic, have a refreshing originality and exhibit a prolific fertility of imagination, aptitude of application and readiness of resource, that are in agreeable contrast with the shortcomings exhibited in the previous series of courts. True, there is an abundance of novelties, which are notions rather than perfectly practical inventions; but even Yankee dodges are often marvelously useful, and at least show the talent and quick, keen acuteness of the intelligence which conceived them. The Americans have a fluency of conception beyond the English inventive genius, and a surprising readiness for making some ingenious machine out of the simplest and commonest elements. In machinery of the larger class they lack the ripe experience of the eminent British firms, but even in engines and steam-power tools there are American makers who take deservedly a very high position.

## Peculiarities of Machinery.

There are some curiosities about machines which seem to be unaccountable. Every user of a sewing machine knows that from some unknown reason the machine which yesterday performed its work so well, so almost enthusiastically, to-day refuses to do more than half its task, and does that half in a surly, indifferent manner. So with many other machines. Even the steam engine is subject to these fits. Is there some occult bond of sympathy between the operator and his machine, by which the latter is influenced by the mental condition of the former; for it is certain that these differences cannot always be attributed to atmospheric or other external influences? This matter is quite humorously and truthfully treated in the subjoined extract from an exchange:

It is perfectly well known to experienced, practical engineers, that if a dozen different locomotive engines were made at the same time, of the same power, for the same purpose, of like materials, in the same factory, each of those locomotive engines would come out with its own peculiar whims and ways, only ascertainable by experience. One engine will take a great meal of coal and water at once; another will not hear to such a thing, but will insist on being coaxed by spadesful and bucketsful. One is disposed to start off, when required, at the top of his speed; another must have a little time to warm at his work and get well into it. These peculiarities are so accurately mastered by skillful drivers, that only particular men can persuade particular engines to do their best. It would seem as if some of these "excellent monsters" declared on being brought out of the stable, "If it's Smith who is to drive me, I won't go. If it's my friend Stokes, I am agreeable to anything."

All locomotive engines are low spirited in damp and foggy weather. They have a great satisfaction in their work when the air is crisp and frosty. At such a time they are very cheerful and brisk, but they strongly object to haze and mists. These are points of character on which they are all united. It is in their peculiarities and varieties of character that they are most remarkable.

The railway company who should consign all their locomotives to one uniform standard of treatment without any allowance for varying shades of character and opinion, would soon fall as much behind-hand in the world as those greater governments are, and ever will be, who pursue the same course with the finer piece of work called Man.

**BESSEMER.**—An objection made against Bessemer steel is that the ingots on cooling are full of blow-holes. To obviate this, molds are now used which rotate slowly on their own axes after the metal is run in. The effect of this movement is to favor the escape of gas at the centre of the mass, which retains the molten condition the longest, and to produce complete consolidation. Polished sections of an ingot cast under rotation exhibit but few or none of the black specks common in other specimens, supposed to result from the air-bubbles or blow-holes, as they are called in some foundries.

**WARMING BY STEAM.**—When the external temperature is 10° below the freezing point, in order to maintain a temperature of 60°:

One superficial foot of steam-pipe is required for each six superficial feet of glass in the windows.

One superficial foot of steam-pipe is needed for every six cubic feet of air escaping for ventilation per minute.

One superficial foot of steam-pipe is sufficient for every one hundred and twenty feet of wall, roof, and ceiling.

One cubic foot of boiler is required for every two thousand cubic feet of space to be heated.

A one horse-power boiler is sufficient for fifty thousand cubic feet of space. Steam should be about 212°.—*Molesworth*.

**CAST IRON FERULES.**—Cast iron dilates permanently by repeated heatings. Cast iron ferules for boiler tubes, will remain tight when wrought iron ferules will leak, from the fact of the permanent expansion soon induced in the cast iron. Hence the preference of cast iron over wrought iron for ferules in most tubular boilers.

## Scientific Miscellany.

**PLATINUM FROM OREGON.**—At a late meeting of the Lyceum of Natural History, in N. Y., Prof. Chandler exhibited a sample of more than 100 ounces of native platinum from Oregon. Small quantities of this valuable metal have found their way from the Pacific coast from time to time for the last fifteen years; but this is the largest amount ever received at one time. The chief supply of this metal is received from the Ural mountains, which furnish about 4,000 pounds per annum. It occurs in small quantities in almost all placer gold mines, everywhere. It is generally found in very small grains; although it sometimes occurs quite massive. Humboldt obtained a lump in South America which weighed 2½ ozs.; but the Ural mountains have furnished much larger nuggets—one weighing nine pounds, another sixteen, and still another twenty-three pounds. Platinum is always found alloyed with other metals, such as indium, osmium, and iron. The California platinum is very pure, while that from Oregon is very largely alloyed—the proportions of alloy in the former is about 7 to 10 per cent., in the latter from 37 to over 40 per cent. It is considered very remarkable that such wide difference would exist in the value of this mineral in those two contiguous localities.

**A NEW METAL (?)**—In 1862, Prof. Chandler, of New York, received a small quantity of platinum from Rogue River, Oregon, for examination. In the course of this examination he detected what he considered a new metal. It was separated from the ore by hydrochloric acid, was precipitated by sulphureted hydrogen; the sulphide produced was rapidly dissolved by hydrochloric acid on addition of chlorate of potassa, and zinc produced in this solution a precipitate resembling metallic tin. This precipitate was dissolved by hydrochloric acid, but the solution did not give the usual tin reactions with chloride of mercury. On consulting the journal he found that ten years previously Dr. Gentle, of Philadelphia, had noticed among grains of platinum from California, a metal resembling tin, but differing from that metal in some of its reactions. Dr. Chandler was led to believe the two metals to be identical, but the quantity of material at his disposal was not sufficient to enable him to continue the investigation. Through the kindness of Mr. H. M. Raynor he has received a large quantity of the mineral (the 100 ounces of platinum elsewhere alluded to in the present issue), and the question of the supposed new metal will soon be determined.

**WET AND DRY GROWTH.**—There is a great difference in the specific gravity of the same species of tree whether grown in a dry or moist soil. The difference is frequently as great as seven to five; and the weights which a similar beam will support without breaking, in the two cases, are in about the ratio of five to four. Hence it is important in calculating the strength of timber to know something about the locality where it has derived its growth.

**MALLEABLE HORN.**—When horn, reduced to fine shavings, is boiled for a considerable time in a caustic lye of the strength of 25° of the alkalimeter, it is reduced to a perfect solution. After the liquid has evaporated, the horn becomes plastic—malleable—and may be modeled into any desirable form, after which it again gradually becomes indurated.

**TEST FOR PURE BENZOLE.**—If a portion of a sheet of white paper is saturated with pure benzole, it becomes temporarily transparent, as tracing paper. In a short time, however, the benzole entirely evaporates and leaves the paper opaque, as at first, without a stain. If any appearance of transparency remains permanently, a portion of fixed oil is mixed with the benzole.

**EFFECT OF PRESSURE OR FUSION.**—Experiments conducted by Hopkins and Bansen have shown that certain organic compounds, such as spermaceti, wax, stearine, etc., have the temperature of the melting and freezing points increased (but in a very irregular manner) when exposed to pressures varying from 1 to 520 atmospheres to the square inch. Mr. Hopkins further shows by experiments that in the case of sulphur its freezing point is elevated, as in the above organic compounds; but that after passing 520 atmospheres, after 793 (the highest pressure tried) the ratio of increase of temperature to pressure diminishes greatly; and it is hence inferred that this diminution would continue until the temperature of fusion in the open air was again reached, or possibly even passed in the downward scale. It is possible that silicates and other inorganic compounds may be subject to this reversible rule. Such a condition might also possibly materially effect the probable temperature of the internal heat of the earth.

**TESTING COGNAC.**—A correspondent of the *London Chemical News* states that the aroma left on slow evaporation of genuine spirits, when gently evaporated in the hollow of the hand, is so very characteristic that it is used as a criterion in the south of France to distinguish between *esprit de vin*, *esprit de marc de raisin*, and the spirituous fluids obtained from grain and beet root. It is impossible to entirely eliminate from the latter the fusel oil, but this is never present in spirits made from wine, which, on the contrary, always contain small quantities of ananthic and acetic ethers. The smell left on evaporation of spirits not made from wine is so peculiar that it may be even recognized in the ether made from this spirit. The ripeness of the wine, its age, the grapes it was made from, and the whole process of fermentation, leaves an indelible impression on the quality of the spirits obtained. Since the ravages occasioned by the grape disease it will be difficult to procure from France or Spain really genuine spirits.

**CONFINING AIR.**—In experiments made to confine air under pressure, it has been ascertained that the subtle fluid would penetrate iron, copper, gold, platinum, and all combinations of metals. The only thing which would keep the air at its original pressure, in the vessel into which it was forced, was to submerge that vessel in another entirely filled with water, the outer vessel being made perfectly water-tight. The air could not be forced through the walls of a vessel in which it was confined, when those walls were protected on their outer surface by a fixed column of water.

**ALUMINUM BRONZE.**—This alloy is now made in France by a process which is cheaper than the direct combination of aluminum and copper. An alloy of aluminum and cast iron—more easily obtained than pure aluminum—is melted with copper and well stirred in the crucible. On cooling, the aluminum bronze will be found at the bottom, and may be easily separated from the iron when cold.

**UNHEALTHY EMANATIONS.**—It is known that, under the influence of direct sunlight, the leaves of aquatic plants give off a notable quantity of carbonic oxide and carbonated hydrogen. M. Bessingault thinks that this emanation of carbonic oxide may be one of the causes of the unhealthiness of many districts.

**INTERCEPTION OF LIGHT.**—A lamp shade of the clearest glass intercepts 10.57 per cent. of the light from a gas or other flame; ground glass intercepts 29.48 per cent., or more than one quarter. White opalized glass intercepts 52.83 per cent. of the light due to the flame.

**PLATINUM,** the densest of all metals, is also the most infusible; yet, notwithstanding this fact, many of its compounds or alloys, such as with zinc, tin, arsenic, etc., are so extremely fusible as to readily melt in the flame of a candle.

**A DELICATE TEST FOR SULPHUR.**—A diluted solution of molybdate of ammonia in hydrochloric acid, possesses the property of coloring blue, if traces of sulphur be present. This test is so delicate that sulphur may be detected in a single hair.

## California Academy of Natural Sciences.

## REGULAR MEETING.

MONDAY EVENING, Dec. 16, 1867.

Vice-President Ransom in the chair.  
About forty members present.

The following gentlemen were elected resident members: D. C. Humphrey, P. B. Cornwall and Horace D. Dunn, of this city, and Prof. Rising, of Oakland.

The following gentlemen were proposed for resident membership: W. W. McFarland, George F. Allard, Dr. Isaac Rowell and A. F. Sawyer.

B. M. Hartshorne was proposed for life membership.

The Committee on a permanent building reported favorable progress, and asked further time.

**Contributions to Cabinet.**—Gregory Yale presented several specimens of ores; also a series of samples, in phials, illustrative of the chlorination process for extracting gold from sulphurets. The sulphurets were exhibited in their raw state; after being roasted; the chlorinated water containing chloride of gold in solution; the chloride of gold as a brown precipitate; the sulphate of iron employed to precipitate the gold, and a gold button obtained from the reduction of the chloride of gold, as the concluding part of the process.

**Geology of the Salt Spring Valley and the Region about Copperopolis.**—W. A. Good-year, Ph. B., read a paper entitled "Salt Spring Valley and the adjacent region, in Calaveras county, California." The region described comprises the copper mining district of Copperopolis, and the country west of it as far as the San Joaquin plain, including the belt of decomposed slates, in which the Quail Hill mine occurs. The writer, after a brief description of the topography of the country, proceeded to give in considerable detail the results of his observations respecting its geology, both general and economical. The paper contained many points of interest, not the least of which was a fuller description than has yet been published of the geological character of the auriferous belt which contains the Quail Hill and other similar mines. Its reading occupied about half an hour. We shall publish this paper in full, at an early day.

**On the Occurrence of Glauberite at Borax Lake, California.**—Prof. Silliman exhibited to the Academy several crystals of the mineral Glauberite, a species not before recognized as occurring in North America. It occurs at Borax Lake, where it has lately been obtained in blue clay, brought up from a depth of 40 feet by an artesian boring. No other crystallized species was detected in the masses of clay examined.

Glauberite is a sulphate of lime and soda, half an atom of each base in combination with an atom of sulphuric acid. It is usually associated with rock salt, as at Villa Rubia in New Castile, and also at Aussee in Bavaria, and in the salt mines of Vic in France. In the Atacama desert in Peru, it is associated with a fibrous borate of lime called Hayesine. Mr. Stretch, the State Mineralogist of Nevada, in his catalogue of minerals found in that State mentions borate of lime (Hayesine) as occurring in globular masses in layers from two to five inches thick, alternating with layers of salt in a salt marsh in the Columbus mining district, Esmeralda county. It is quite possible that a careful scrutiny would detect glauberite also in this association, so analogous to that of Atacama.

Reference was also made to the occurrence of the species *Gay Lassite*, detected by Prof. S. in 1864, at the Little Salt Lake, near Rag Town, in Nevada, as illustrating, in an interesting manner, the chemistry of these bodies of saline water. The latter species is a hydrous carbonate of lime and sodium, while glauberite is a sulphate of the same bases. Both salts undoubtedly result from the reaction of the respective elements pre-existing in solution in the saline waters.

The crystals of Glauberite from Borax Lake occur in very thin flattened tables, derived apparently from the great extension of the faces *O* of the monoclinic prism.

**Occurrence of an Entomostracous Crustacean upon the surface of Borax Lake.**—Prof. Silliman called the attention of the Academy to specimens of the remains of a species of red colored crustacean, which suddenly appeared in the latter part of June, upon the surface of the water in Borax Lake, and almost as suddenly disappeared after a few hours. He was indebted for a knowledge of the facts to Mr. Lafayette Maynard, of San Francisco, who has placed the specimens before the Academy at the disposal of Professor S.

In company with Dr. James Blake, Prof. S. has examined these remains under the microscope, which, with a low power at once

disclosed their true character as crustacean, referable to the family of Entomostraca, most probably of the genus *Daphne*. Some of the plates are elegantly fringed with long delicate hairs; but decomposition has impaired the perfectness of the specimens so that it is difficult to obtain from the mass an entire individual.

The red colored species was so abundant and brilliant as to give a striking red color to the water over some acres in extent.

At Mono Lake, and also at Little Salt Lake, Prof. S. had collected one or two species of Entomostraca which occur in those waters abundantly, but are colorless.

As it is probable that these species abound for only a very short time in the year, it becomes interesting to know if naturalists have observed their transformations and periods.

In some remarks, which followed the reading of this paper, Dr. Behr stated that he had examined similar specimens from another locality, which were obtained in a very perfect condition, and had ascertained beyond a doubt, that they were *Daphne*. Mr. Falkenau had submitted them to a chemical examination to ascertain their value in the arts. He thought they might be manufactured into a paint. Their substance is very durable, but little liable to change, even when submitted to dilute sulphuric acid.

**Entozoa in Pork.**—Dr. Gibbons called the attention of the members to the specimen of pork, which he had exhibited at the last meeting, as containing parasites which he believed to be the larva of the tape worm. Drs. Behr and Blake pronounced them a distoma, which he had not disputed at the time, though he had never heard of the distoma or fluke being found in the muscles. On further examination he had assured himself that they do belong to the tape worm family, and are a true cysticercus. He referred to Dr. Henry Gibbons, Jr., for a verification of this statement.

Dr. Gibbons, Jr., said he had fully examined the entozoa in question, and that there could be no doubt that it was the embryo of the tape worm—technically the *Cysticercus cellulosa*. He gave the following reasons for this conclusion: 1st. The distoma has never been found in the muscle of man, nor, so far as I am aware, in the muscle of any other animal. Its proper dwelling place is the liver, and in that organ it is common in the hog and sheep, causing in the latter the disease called the "rot." It has occasionally been found in the larva form in the human eye and elsewhere.

2d. The structure of the distoma and cysticercus is altogether different. The distoma is more highly organized—has an intestinal canal, vascular system, etc., which the tape worm family has not. The distoma, too, has no caudal vesicle or bladder, such as we saw in the parasite exhibited.

There are found in the human body thirty-one species of mature parasites, besides several larval forms of the same, and also some doubtful species. These are divided into three sub-classes, the Trematodes, which are flat or oval worms an inch or less in length, and inhabiting almost universally the liver. They comprise the fasciola and distoma or flukes.

Nematodes, or thread worms, similar in form to the common earth worm. They comprise most of the intestinal worms, such as the long round worm, the seat worm, the pin worm, also the lumbric worm, the *Trichina spiralis*, the renal and bronchial strongle. They are supplied with a mouth and intestinal canal, circulatory, nervous and sexual systems, etc., and are more highly organized than the other entozoa.

Cestodes, or belt like worms or tape worms. These have no mouth, but live by imbibition. The larval forms, when taken into the body, may be carried to any of its parts, and there constitute *cysticerci*, such as those presented at the last meeting, which were, however, very young, and did not exhibit the most distinct form. When a little larger they present a head and neck, invaginated in the caudal vesicle, which is filled with fluid, such as I saw in a specimen taken from the fat (suet) of a sheep, handed me by a butcher some time since, in this city. This specimen was about the size of a large marble, and I believe was the *cysticercus termicollis*, or the larval form of the *Taenia Marginata*. From these imperfect descriptions almost any one could decide as to which class the parasite under consideration belonged. As further proof, the exact representation of the entozoon may be found in Cobbold's larger treatise on entozoa.

[Parasites, either in man or animals, are not common in California. The *Trichina*

*Spiralis* has never been found here, and the cysticerci in question are the only examples of the kind that we have seen or heard of. Parasites never originate in the body—or, indeed, elsewhere—spontaneously. They are taken up in the food or drink, and in this country, where the food is generally better cooked than in many parts of Europe, or perhaps to word it better, where less rare meat is eaten, there is little chance of becoming infested with the more dangerous parasites. Thorough cooking always destroys the parasite, for its albumen is coagulated at a temperature of about 170 degrees, and in cooking, the temperature is generally much higher. Meat containing the cysticercus or *Trichina spiralis*, if thoroughly boiled or roasted, might be eaten with impunity. The reason the inhabitants of Germany suffer so seriously from these parasites, is that they use so much raw ham and other dried meats.]

**The Big Trees.**—Mr. Bloomer made some interesting remarks, with regard to the Big Trees, their nomenclature, etc., which will be given in a future issue.

**Introduction of a new Fibrous Material.**—Dr. J. M. Sharkey, exhibited to the Academy, specimens of a fibrous plant of the class *Agave* and *Yucca*, known among the natives of Nicaragua as *pita*, *caboyo* and *maneuella*. The specimens exhibited were in the dry leaf, the fibre simply separated from the tissue, and the same bleached to the color of the finest Manila. The leaf from which this fibre is extracted grows to the length of from 12 to 15 feet; it is about two inches broad and of uniform width throughout. The fibre is easily separated from its tissue, in its entire length, with scarcely a single broken thread. The specimens of fibre exhibited were bunches, each individual fibre of which was about six feet long. It seems to be quite as strong as manilla, and may be readily worked up into all the purposes for which the more expensive and less tractable manilla is applicable. A set of machinery was recently manufactured in this city, at Mr. L. P. Garsin's machine and forge shop, No. 32 Sutter street, for a company who are now putting up the same in Nicaragua, where they will grow this plant and prepare its fibre for the manufacturer, placing it in the market in much the same condition as manilla is now offered.

Mr. Sharkey said it was proposed to try the cultivation of the plant in this State, in some portions of which, it would undoubtedly flourish. If it could be raised here and made to supercede the ordinary use of hemp and Manila; it would retain among our own people a large amount of money which now goes abroad to purchase the foreign material. It is estimated that about \$3,000,000 worth of such coarse fibrous manufactured material is annually consumed on this coast.

[The proposed experiment is one of much economic importance to this city and State, and we propose to advert to it again, editorially.]

**PATENTS ALLOWED.**—We have special advices that the following applicants for patents through the MINING AND SCIENTIFIC PRESS AGENCY, have recently had their claims allowed by the Commissioner of Patents, at Washington:

D. Jones, San Francisco—Wagon Axles.  
S. Wepely, San Francisco—Spurs.

W. P. Kirkland, San Francisco—Drain and Water Pipes.

H. Donnelly, Virginia City—Ore Concentrator.

D. R. Morgan, San Francisco—Eye Medicine.

A. W. Putnam, San Francisco—Fruit and Vegetable Box.

Payne & Ayres, San Francisco—Finish for Painters.

F. Rohrer, San Francisco—Lamp Extinguisher.

J. D. Cramer, San Francisco—Sash Raiser.

Johnson & Milliken, San Francisco—Faucet.

L. P. McCarty, San Francisco—Newspaper File Holder.

J. R. Adams, Cisco—Railroad Snow Plow.

Wm. Schmobz, San Francisco—Solar and Transit Instrument.

**THAT'S SO.**—The *College Echo*, of Oakland, says it was reserved for the United States to represent all races in one nation; but for California to represent all colleges in one Republic of Letters—the "Associated Alumni of the Pacific."

**CALIFORNIA SPARKLING WINES.**—But few persons are aware of the progress made within the last three years in the production of sparkling wines or champagnes in California. It will doubtless be new to many that such improvements have recently been made in this branch of industry, that even experts or connoisseurs are put to the severest test to discriminate between the foreign and native productions. In the perfection of this branch of art, California is largely indebted to Mr. Arpad Haraszthy, and who has spent much time and money in traveling and studying in the wine regions of Europe, for the purpose of obtaining the fullest knowledge in relation to wine-making, the most important part of which is not laid down in books. How well he has succeeded is known to but few; but that his success has been most full and complete may be fully attested by any connoisseurs who will take the trouble to call on him at Mr. Landsberger's store on Jackson street, who is himself a pioneer in the business in this city, and who has done much by his capital and energy to advance the business to its present point of success. These gentlemen will take much pleasure in showing parties interested through their vaults.

**NEW QUARTZ MILLS.**—A new 20-stamp quartz mill, with hoisting works sufficient to go down 1,000 feet, engine, etc., complete, was started about the middle of last month by the Mountain View Co., near Grizzly Flat, in El Dorado county. This mill is working on very rich ore, and is doing remarkably well. The pulp from the battery is run over copper plates and distributed into eight of Hungerford's Improved Concentrators. The company are now putting in pans to work the concentrated sulphurets. The mill was planned by Mr. M. Hungerford, and the works constructed under his personal supervision. The machinery was from Goss & Lombard's Foundry, Sacramento.

Another 20-stamp mill with engine, boilers, etc., was started some three months since, by the Golden Rule Mining Co., near Piuo Station, Placer county. The engine and machinery was built by Goss & Lombard, which, together with the mill, was erected under the immediate supervision of Mr. Hungerford. Eight of Hungerford's Concentrators are also employed in this mill, together with pans for the final reduction of the concentrated sulphurets.

**UNIVERSITY COLLEGE SCHOOL OF MINES.** By an advertisement in another column it will be seen that the laboratory of this institution will be opened January 6th, for a course of lectures by Prof. Price, to continue during four months, on practical metallurgy and mining, as applied to the useful minerals of this coast. We shall allude further to the plan and object of the lectures next week.

**ANOTHER GOLD MILL** is being put up at Lisbon, N. H., a further evidence of the success of these mines. It will be a 20-stamp mill.

**MARKET STREET HOMESTEAD ASSOCIATION.**—J. S. LUTY, Secretary. Office, 305 Montgomery street, corner of Pine, San Francisco. 2v15

**BUSINESS NOTICE.**—Mr. A. T. Dewey, of this Journal, contemplates a visit of several months in the Atlantic States, a portion of which time he will spend in Washington, New York and Boston. Any of our Eastern friends who wish to communicate with him, for business or other purposes, will address their letters to "Westfield, Mass."

JACOB SHAW, Pioneer Photographer, 612 Clay street, north side, four doors above Montgomery, (late 315 Montgomery street,) takes all kinds of Photographs in the best style of the Art. He would invite special attention to the new "Cabinet Photographs," which he is taking to perfection. 10v14t

**SECRETARYSHIP FOR MINING COMPANIES.**—A gentleman of education, ability and experience, is desirous of procuring a position as Secretary, or Assistant Secretary, in some good Mining Company. Has most unexceptionable references. Address "SECRETARY," at this office. 6v15t

**CO-OPERATIVE UNION STORE.**—This is becoming one of the most useful institutions in the city, and the Mechanic and Laboring Man fully appreciate it. They are now enabled to buy their Groceries and Provisions twenty per cent. cheaper than ever before, and the very best articles in market. The store is located at 115 Satter street, Lick House Block. 2v16t

Weekly Stock Circular.

Of Associated Brokers of the S. F. Stock and Exchange Board.

SAN FRANCISCO, SATURDAY MORNING, December 24, 1867.

City Stocks.

City Stocks have been remarkably quiet during the period under review, and the transactions have been few. We notice the very unusual sale of a few shares of the Bank of California at \$117 50 @ 152 50 s 30.

Mining Share Market.

Since our last reference, the mining share market has been active and very firm, fully verifying our prediction of an improvement, and the tendency seems to be still better prices.

The bullion receipts of the Imperial, Gold Hill Quartz, Savage, Hale & Norcross, Kentuck, Crown Point, Chollar-Potosi, Empire and Overman during the month of November, as per statement of official records, amounted to \$761,224 against \$857,054 in October.

GOULD & CURRY—has been more active, rising from \$300 to \$370, and closing at \$340. At the annual meeting of this company, on the 16th inst., the following gentlemen were elected Trustees: Alphens Bull, M. Morgenthau, Abraham Seligman, L. Cunningham, John H. Dall, Thos. Bell and Thos. Sunderland.

On the 16th inst., the assets and liabilities were as follows:

Table with columns for Receipts and Disbursements, listing various financial items and their values.

At San Francisco and Virginia office \$4,908 08

The mine produced 21,940 tons of ore, and 26,480 tons were reduced, showing an average value of \$24 66, and \$3 81 per ton less than in 1866.

EMPIRE—sold more freely than usual, at \$165 @ 182 50, then at \$167 50, and at the close \$165 is hid.

Table with columns for Receipts and Disbursements, listing various financial items and their values.

Table with columns for Disbursements, listing various financial items and their values.

The assets of the company November 30, 1867, were as follows: Cash on hand, \$1,838 32; bank accounts, \$68 08; mill and mine supplies, \$14,056 48—total, \$15,962 88.

OHM—improved from \$50 to \$80, and closed at \$67 50. At the annual meeting of the stockholders, on the 18th inst., Edward Martin, Jesse Holladay, Solomon Heydenfeldt, Robert F. Morrow, George Treat, L. W. Coe and Frank Livingston were elected Trustees for the ensuing year.

Table with columns for Disbursements, listing various financial items and their values.

The product of the mine from 1860 to date of report amounted to \$5,286,639, and during the same period the dividends foot up \$1,394,400, and the assessments \$425,600.

SAVAGE—has improved very materially, advancing from \$111 to \$120, receding to \$113 50, and closing at \$121. During the week ending December 14th this mine yielded 1,813 tons of ore, showing an approximate value of \$34 98 per ton.

CROWN POINT—is in better favor, advancing from \$640 to \$700, then selling at \$690 @ 699, and closing at \$690 s 3.

KENTUCK—sold to a large extent, gradually rising from \$160 to \$215, and closing yesterday at \$226.

HALE & NORCROSS—rose from \$1,150 to \$1,300, and closed to \$1,140, improved to \$1,170, and receded to \$1,160.

CHOLLAR-POTOSI—sold within a range of \$130 @ 135, then at \$130, and closed at \$132. During the week ending December 14th, this mine yielded 1,442 tons of ore.

GOLD HILL QUARTZ—opened at \$95, then sold at \$75 ex-dividend, and closed yesterday at \$76.

The aggregate sales of Stocks, Legal Tender Notes, etc., at the regular sessions of the Board since Saturday last, amounted to \$1,302,415.

VIOLENT VS. MODERATE EXERCISE.—Quite a sharp controversy is going on in the English press pro and con on the question of violent exercise, as at gymnasiums, etc.

A MARVELOUS sleeping car has been turned out of the Chattanooga Railroad shops. It has velvet carpets, black walnut casings, gold and silver plated ornaments, heaters, gorgeous lamps and mirrors, and a fine Burdett organ.

MINING SHAREHOLDERS' DIRECTORY.

[Compiled for every issue, from advertisements in the Mining and Scientific Press and other San Francisco Journals.]

Comprising the Names of Companies, District or County of Location; Amount and Date of Assessment; Date of Meeting; Day of Delinquent Sale; and Amount and Time of Payment of Dividends.

Large table listing mining companies, their locations, assessment dates, and dividend information.

\* Those marked with an asterisk (\*) are advertised in this journal.

Latest Stock Prices Bid and Asked.

Table listing various stock prices, including United States Bonds, California State Bonds, and other securities.

Table listing Gas Companies and their stock prices.

Table listing Railroads and their stock prices.

Table listing Banking Institutions and their stock prices.

Table listing Insurance Companies and their stock prices.

Table listing Mining Stocks—Washoe District.

Table listing San Francisco Market Rates, including Wholesale Prices for various commodities.

Table listing San Francisco Market Rates, including Wholesale Prices for various commodities.

Table listing various goods and their prices, including Coffee, Tea, and other commodities.

Retail Prices.

Table listing retail prices for various goods, including Butter, Eggs, and other food items.

ARTIFICIAL ICE FOR SAN FRANCISCO.

The machinery for the artificial manufacture of ice in this city is now in course of construction by the Ames Manufacturing Co., at Chicopee, Mass.

NEW INCORPORATIONS.

Articles of incorporation have recently been filed in the County Clerk's office in this city as follows:

CALIFORNIA CHICORY CO.—San Francisco, co. Dec. 17th. Capital stock, \$100,000; 100 shares, \$1,000 each.

VIRGINIA CITY GAS CO.—San Francisco, Dec. 17th. Capital stock, \$150,000; 1,500 shares, \$100 each.

PACIFIC SHIP BUILDER'S ASSOCIATION.—San Francisco, Dec. 19th. Capital stock, \$50,000; 2,500 shares \$20 each.

PACIFIC UNION EXPRESS CO.—San Francisco, Dec. 18th. Capital stock, \$300,000; 100 shares, \$3,000 each.

EMPIRE M. & M. CO.—San Francisco, Dec. 18th. Trustees: Chas. Mayne, Robt. Sherwood, John A. Stanly, A. E. Head, W. G. Wagman.

CALIFORNIA CHICORY COMPANY.—We notice that a company has been formed, having its headquarters in this city, to engage in the manufacture of chicory.

## Mining Summary.

Tax following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

## CALIFORNIA.

## Alpine County.

*Miner*, Dec. 7th: The ore now found in the bottom of the Tarshish mine, is finer and more evenly distributed through the rock, than any heretofore found.

Native copper in metallic granules has been found in the Léviathan mine. It is found in a brown ore, or oxide of copper, and is easily smelted.

The tunnel of the Illinois and California Co. is fast approaching the Sacramento lode.

*Chronicle*, Dec. 7th: The work on the shaft of the Pittsburg mine progresses night and day. Everything about the mine appears to be convenient for working. The Wide West claim has been purchased by the Pittsburg Co. but no work has yet been done on it.

On Monday last we were shown a large piece of ore from the George Washington claim in this town. It was a beautiful specimen of gray quartz, 130 pounds in weight, and rich in silver. It was taken from the bottom of the 50 foot shaft, and is considered one of the finest specimens of silver ore ever taken out of any mine on this side of the Sierra Nevada.

On Monday last another cow was slaughtered in this town, and another gold mine struck. A few scales of gold, a large number of tacks and a hant nail were found in her stomach. This cow has also been grazing on the Norwegian ranch on Wolf creek.

## Amador County.

*Ledger*, Dec. 14th: One half of the Union mine, near Pine Grove, was sold last week to a capitalist of San Francisco, and work will be pushed ahead vigorously on it.

## Calaveras County.

*Chronicle*, Dec. 14th: The rock which Mitchell & Co. hauled from their lead near the Junction to the French mill in Rich Gulch, netted them \$7 per ton. They are now engaged in hauling a lot of rock to Prindle & Co's mill in Chili Gulch, which will probably yield larger returns. The shaft sunk on their claim has developed a solid, well defined vein of quartz, four feet in width, every pound of which will pay at the rate of from \$7 to \$10 per ton.

Staples & Co., are progressing rapidly with the erection of their mill in old Rich Gulch. The company expect to commence crushing on the first of January.

Alexander, Seavers & Co. are "pounding" out the precious metal as fast as the capacity of a 10-stamp mill will permit.

Wesson & Co., are obtaining encouraging prospects.

Bates & Co., are also hnsly employed in prospecting a promising vein.

Quite a number of capitalists are at present in town for the purpose of inspecting the quartz ledges in this vicinity.

Sixty tons of an inferior grade of ore taken from the "Potocot lead" at Railroad Flat yielded \$20 per ton. The rock had been assorted, the first quality paying \$60 per ton. There are a large number of claims at Railroad which are paying handsome dividends, keeping Hepburn & Co's mill constantly employed crushing.

San Andreas *Register*, Dec. 14th: Water was introduced into Frankfort early this week. The ditch and reservoir are in fine condition, and will soon supply an abundance of water. The owners of three of the claims have commenced washing, but have not yet "cleaned up."

## Mariposa County.

*Mail*, Dec. 14th: The flood in the Merced River, caused by the late heavy rain, carried away the Mariposa Co's costly dam at the Benton Mill. The dam was approaching completion, and had cost about \$17,000. Its destruction at this time involves a general suspension on the Co's works at that point, until the water falls next summer.

The new and splendid mill of Robinson & Co., working the ore of the Potts mine, in Hunter's Valley, was cleaned up on Tuesday last, after the first month's run, and yielded about half a bushel of amalgam.

## Nevada County.

*Transcript*, Dec. 13th: The mining prospects in Nevada county were never better than now. Already we have had twenty-five inches of rain and very little snow in any part of the county. The hydraulic mines have an abundance of water, and there is no interruption of work on account of cold weather. Quartz prospecting continues to develop rich leads and the yield from this source continues to increase.

The late storm has done considerable damage to the Union claim at Relief Hill. The heavy blasts, one of which consisted of 450 kegs of powder, and another of 300, so loosened the banks that they crumbled down,

during the heavy rain, and filled up the shaft. The damage will only delay them a few weeks in opening the mine. This company have been taking out large amounts of money. The Eagle Co. is washing, using four large streams on the bank, and tearing down an immense quantity of dirt. They will clean up about the last of the month. The North Star and What Cheer Cos. are also washing on the hill. The Eagle Co. is running 500 inches at the present time. A tunnel is being run north of the Union Co., for drift diggings, and they have a fine prospect of striking the gravel lead.

Dec. 14th: A considerable amount of prospecting is being done for quartz in the vicinity of Diamond Creek. The Salathiel quartz mill was started up for the first time on last Saturday. The company are working what was formerly known as the Mary Etta ledge. They have 150 tons of rock out, upon which the mill is now at work. The Enterprise Co. are running a tunnel for the purpose of opening their lead. Last spring five tons of rock from this claim was packed to Grass Valley upon mules, and the yield was \$44 per ton. Several companies are also engaged in working gravel claims in this locality, with fine prospects. There is a large range of country about Omoga entirely unprospected, which abounds in quartz and gravel, which will pay. The companies have not yet cleaned up on Diamond Creek, but they have excellent prospects.

Dec. 17th: Prospecting for quartz on Grizzly Ridge is not so active as it was a year ago. Hubbard and others have recently commenced work upon a ledge, the rock of which is peculiar, and gives evidence of being exceedingly rich, assaying \$1,800 to the ton. The rock contains a large amount of dark sulphurets, and looks as though it held considerable iron. Although these sulphurets the small particles of bright gold is embedded, showing that much of the gold contained in the rock may be saved by ordinary mill process.

*Gazette*, Dec. 12th: The Eureka Co. has disbursed \$20,000 among the owners, and the North Star Co. \$10,000—earnings for the month of November.

Dec. 16th: The new 10-stamp quartz mill of Clark & Poquillon, at Graniteville, Eureka district, was started up on Friday last. The mill is run by water power, the wheel having first been erected to run arastras, which are still connected with the mill as amalgamators. The first crushing will be a lot of 100 tons of rock from the Sweet ledge.

Grass Valley *National*, Dec. 16th: The Illinois and Wisconsin Co. are having 200 loads of Quartz from their mine crushed at the Sebastopol mill, which from present prospects will pay from \$50 to \$70 a ton.

EXCELSIOR.—*Gazette*, Dec. 17th: Snow at Meadow Lake is from a foot to 18 inches deep, and from two to three feet in depth at the Summit.

## Placer County.

*Herald*, Dec. 16th: The famous Green Emigrant claim on Bald Hill, which was sold about a year ago, has reverted back into the hands of the original owners, the purchasing parties having failed to make pecuniary connection. A large amount of gold has been taken from the claim, but no dividends have yet been made.

The rich quartz claim of Perry, McGonigle & Co., on the Black Ledge, which had been yielding from \$20 to \$500 to the pan, has during the recent rains been caving, but it is now completely timbered and ready for work.

The You Bet correspondent of the Dutch Flat *Enquirer* of Dec. 14th, gives the following items:

Water is plenty since the late rains. Edward Williams is the first to start up his hydraulic mines on Brown's Hill. Last year his claim paid well, and the prospects are good to do even better this season. Quite a number of hydraulic claims are in full blast. On Saturday of last week, Mulloy & Co. cleaned up \$750 from the coppers alone, after running the mill 20 hours and not more than one-half of the gold passes out of the battery on the coppers. The best pay in the claim is found about one foot from the bed rock, the rock itself scarcely paying the men's wages who are employed to clean it up. Immediately over the bed rock is a layer of sand soft and easy to work, and from one foot to 15 inches in thickness, over which is found a strata of gravel which contains the gold.

Judge Brown has taken out of his claim lately, as high as \$5,000 in five and a half days' run, and at no time less than \$4,000 a week. The Judge is taking out dirt about four feet high, and finds gold in more or less quantities through all of it; and always where the most gold is found they find the heaviest strata of sand.

## Plumas County.

Quincy *National*, Dec. 7th: The Dutch Hill correspondent writes: The mines in this vicinity continue to roll out some of the precious ore, notwithstanding the stormy weather. The Bamboo Co. still continue to work their river claim, and are taking out good pay. The old Dutch Hill Co. are working better ground than they have worked for many months. Waggoner & Ferguson are doing well in the Zeiring claim. Mr. Zeiring left a few days ago for the Atlantic States with over \$8,000, the proceeds of last summer's work.

Bly & Benham have completed their tunnel in the Grey Eagle claim on Barker Hill, and are getting excellent prospects. Bryan & Co's claim is paying from a half ounce to an ounce to the cart load, and J. J. Mcchling is doing tolerably well in his claim on the same hill.

From the Crescent Mills a correspondent writes: The Crescent Mill is running 16 stamps under the management of Mr. Thos. Peard, and to-day cleaned up 250 ounces of amalgam, the result of a week's run.

## San Bernardino County.

*Guardian*, Dec. 7th: The mining claims of Green & Cameron in Tehachap Valley, are clearing \$3 per day to the hand, after paying expenses.

## Shasta County.

*Courier*, Dec. 14th: McPherson & Co. are hard at work on the bed rock flume through which they expect to wash several acres of gold yielding gravel near Piety Hill. This flume is being cut three feet wide, and will be several hundred yards in length. Ludwig & Froshlee have contracted to furnish 1,000 inches of water to work this claim.

But little is going on at South Fork at present. The recent rains caused the Bullion shaft and tunnel to cave in considerably, and the owners are engaged in clearing away the debris. Only a few persons remain at the mines this winter.

## Sierra County.

*Mountain Messenger*, Dec. 14th: The Good Hope Co. have let a contract for running a new tunnel to their ledge, which is calculated to open the mine a long distance below the present working.

The Montpelier Mill has been running for several days upon quartz taken from the Sailor ledge. The intention is to crush 100 tons of rock. Work has been temporarily suspended by the drift brought down by high water.

Larrieu & Co., while running a tunnel in gravel in Slate Castle Ravine, struck a ledge of decomposed quartz in which gold is visible to the naked eye. Excellent prospects are obtained by panning out the decomposed rock. The owners have already received a proposal to erect an arastra to be paid for out of the ledge.

Mr. Wehe is still engaged in developing his ledge, with prospects as good as ever. Great confidence is felt of its permanence.

The Gold Bluff Co. are steadily pushing in their tunnel, and it is expected that they will be ready to work in the Spring.

## Sierraville County.

Yreka *Union*, Dec. 7th: Gregory, Miller & Co. are doing well in their claim on Grouse Creek. They have taken out some days as high as 12 or 13 oz. to three hands. Their success establishes the fact that Grouse Creek is a good mining stream, and as it is several miles in length it will furnish claims for a large number of miners.

## Tulare County.

*Visalia Delta*, Dec. 11th: J. T. Carter & Son of the Philadelphia Co., at White River, passed down on Friday, having discontinued running their mill for a few weeks, while their mine is being properly opened. They have been crushing a very fine quality of rock, and Mr. Carter had with him the evidence of its richness in the shape of a large quantity of bullion.

Mr. Keeney, agent of the Olanche Co., has conditionally purchased a very rich lode at Sage Land.

## Yuba County.

*Marysville Appeal*, Dec. 11th: At the annual meeting of the Pennsylvania Co. held on the 9th inst., the treasurer and secretary's reports, showed that the company took out in 1867, during eight crushing months \$70,000, against \$29,000 in 1866. The mill is now running its full battery of 16 stamps, and the President stated at the meeting that he had several good paying chimneys, instead of one, as was the case last year; and that sufficient quartz was in sight to supply 16 stamps regularly for more than a year.

## ARIZONA.

The Wickenburg correspondent of the San Bernardino *Guardian*, of Dec. 7th, says: Mr. P. W. Smith, owner of the adjoining claim to the discovery on the Vulture lode, has commenced operations. He has sent out a number of men to get out rock which

is intended to be crushed in the Wickonburg mill.

The Vulture Co's mill runs with great regularity. The weekly yield of gold from it for several months did not vary over \$200, although the rock had been taken from various parts and depths on the vein.

Los Angeles *News*, Dec. 6th: Capt. Cattick, who has just arrived from Vulture City, Arizona, brought some specimens from the Vulture mine, that exceed anything in richness we have ever seen in California. Mining prospects are reported to be good.

## COLORADO.

Georgetown *Miner*, Nov. 28th: Garrott, Martine & Co., lately run two tons of unselected ore from the Junction lode, on Democrat Mountain, that yielded 163 ozs. of silver; hullion, value, \$173. The yield per ton was \$86.50.

Five tons of ore, from a greater depth, is now being transported to the reduction works for treatment.

At the surface the ore from the Terrihlo lode assayed less than \$100 per ton; at 20 ft. this assay was doubled, and now at the depth of 46 ft., the assays run as high as \$7,000 per ton.

Mr. Dennison is getting a nugget of silver out of ore from the Mexican lode.

A fine body of ore is being disclosed on the Herkimer lode.

Dr. Johnson, of the Smelting Works, reports 3,914 ozs. of silver bullion, worth in currency, \$6,869.07, as the result of three weeks run.

Gen. Marshall is developing the John J. Roe and Hercules lodes, on Brown Mountain. The ore from these lodes is argentiferous galena and sulphurets of silver, assaying 1,050 ozs. silver per ton.

The L. M. Hartwell lode, on Sherman Mountain, yields a sulphuret ore that runs, in quantity, \$274 per ton, in silver.

Martine & Co. have erected a small revolving barrel, for the purpose of thoroughly cleaning the amalgam before retorting. The process is Wm. Brückner's patent, and has the reputation of being the cheapest and most efficacious mode of extracting the base metals from amalgam.

Garrott, Martine & Co. have reduced one ton of unselected ore from the Silver Eagle lode, the yield of which was 194 ozs., with a currency value of \$295.70.

*Register*, Nov. 26th: In the Keith shaft, on the Mammoth lode, the vein of pure copper and iron pyrites is six feet wide, and the ore yields from \$50 to \$60 per ton. The Cheney Hill shaft yields ore, paying from \$20 to \$35 per ton.

We saw Mr. Cheney and Mr. Miley meet at Hussey's counter yesterday, one with 37, the other with 45 ozs. of gold from the Bob, tail Co's rock.

Mr. Fry, agent of the Montgomery Co., recently picked up some ordinary looking rock that had been thrown out as refuse, and hauled it to Kimber's mill in Eureka. The plates appearing well, he took more of the same, 17 tons in all, from which he got \$462 worth of gold—at the rate of \$27 per ton. The very choice ore from this lot of rock, to the amount of three tons, had been reduced at the California Works, yielding \$104 in gold, at \$51.87 a ton.

Langford & Co. have finished the Dodge crusher and ball pulverizer for the Kenyon mill, and are nearly ready to run.

Denver *News*, Nov. 27th: The First National Bank shipped yesterday two bars of gold bullion, valued at \$2,600. They had on their counters this morning a bar valued at \$1,000.

At the United States Mint this morning, was a bar of gold bullion whose weight was 102 51-100 ounces, fineness .843, value \$1,806.79. Three bars were paid out to Hussey & Co., whose combined value was \$2,040.12, and one bar to the Colorado National valued at \$148.85.

Dec. 3d: Messrs. Carpenter & Simmons took off another button of silver, weighing 149 lbs., at the Georgetown Smelting Works, a day or two since. It is from their Equator ore.

*Times*, Nov. 28th: Wells, Fargo & Co. shipped from this city during the week ending the 20th inst., hullion valued at \$27,840.

## IDAHO.

Owyhee *Avalanche*, Dec. 7th: The richness of the Oro Fino ore increases with depth of working. Gold is visible in a large portion of the quartz in the vein. The Morning Star mill is kept constantly at work on ore from the mine.

The ore from the Ida Elmore is now being taken from the depth of 80 ft. Steam hoisting works have been erected at the mine.

The main body or rich streak of quartz in the Golden Chariot, shows a width of about two ft., the remainder being composed of horses of granite and veins of quartz a few inches wide. The ore is of the same quality

of richness as that of the Ida Elmore. The gold can be seen in almost any of it.

*World*, Nov. 23d: Ore from the King ledge at Summit Flat yields by working process all the way from \$10 to \$55 per ton. Ore from the Specimen lode pays not lower than \$30, and as high as \$100 per ton. Other ledges in that region are also prospering, and Summit Flat promises to become one of the best quartz districts in the country.

The Elk Horn Co. have declared a dividend of \$3 per share. The last clean up yielded \$9,000 in gold bars.

We were shown yesterday the product of 28 tons of ore from a ledge recently discovered by Channel & Thatcher, which averaged over \$47 in bars per ton.

**MONTANA.**

*Post*, Nov. 30th: Mr. E. R. Collins has placed on exhibition at the office of the Montana *Post*, a fine lot of sapphires and other gems, from El Dorado Bar, which are pronounced by lapidaries and gem dealers at the East, to be as fine as any sapphires ever found.

The work of digging the El Dorado ditch is completed, and a great portion of the fluming done.

Quite a number of miners are wintering at Cow Creek. The mines will give employment and good wages to a large number of persons in the spring.

The Bannock correspondent writes: The New Jersey Co. is now running their astrata. At a trial of seven-eighths of a cord from the Cherokee lode, the result was 22 ozs. Clark & Kirby run 16 cords of the same through their stamp mill and cleaned up \$1,200. Mr. Trask is going down on No. 9 Dakota, with the most flattering results—plenty of rich gold bearing rock and every stroke of the pick makes money. Mr. Jagger's company is still sluicing, taking pay dirt out of the head of the creek.

**NEVADA.**

**Black Rock.**

*Amador Ledger*, Dec. 7th: Tozier, of the Onida mine has returned from a visit to the Black Rock mines. He has no doubt as to their richness, but is doubtful as to whether the ore can be successfully manipulated, owing to its peculiarly intractable nature.

*Sage Brush*, Dec. 7th: Mr. Cheatham has gone to Black Rock to manipulate the ores that will be brought to Atchison & Co's mill for treatment. Mr. Hiskey, the foreman at the mill of Dall & Co., in Washoe, the only man who has worked any quantity of Black Rock ore successfully, speaks in high terms of Mr. Cheatham. The country is rich beyond question and its development is only a question of time.

The following is an extract from Hiskey's letter, dated Franktown, Nov. 29th:

It may be of interest to you and some of your readers who are interested in Black Rock, to know that another lot of Black Rock ore has been worked here, and that enough of the precious metal has been obtained from it to excite curiosity if not admiration. From 2 1800,2000 tons of ore worked in new harrels and with clean quicksilver, I have just extracted a bar weighing 30.16 ozs., worth \$48.25.

**Humboldt.**

*Unionville Register*, Dec. 7th: The antimonial dross from the Oreana furnaces is now shipped to San Francisco to be used for type metal.

The excitement concerning the developments in the Fall & Co's mine continues. Already sales of feet have been made. Buena Vista cañon promises to resume its former life and activity.

Satisfactory gold prospects have been discovered in Independence Valley.

Ore from the Cumberland mine in Gold Run is now being worked at Holt's Mill, with favorable results.

There are now piled up at the Oreana furnaces over 400 tons of pig metal, awaiting the process of refining.

**Reese River.**

*Reville*, Dec. 5th: The Smoky Co., in Smoky Valley district, at the depth of 200 feet, have developed the full proportions of the vein. Twenty feet of the vein are composed of ore that will yield from \$60 to \$150 per ton. The Co. is engaged in erecting a 20-stamp mill near the mouth of Geneva Cañon. Other veins in the district are large, and some of them exhibit themselves for great distances upon the surface, and although they show ore of a low grade, an improved and cheap mode of reduction will render them valuable.

Dec. 6th: Yesterday 5,000 ozs. of crude bullion were taken to the assay office of the Manhattan mill for melting. The bullion was produced by the mill of the Centenary Co. in the Newark district.

On the Belmont stage which arrived last evening, there were two bars of bullion from the mill of the Belmont Co.

Dec. 11th: The stage to-day, brought 1,600

ozs. of bullion from the Social and Steptoe mill at Egan cañon.

We saw this morning at the assay office of J. R. Murphy a box containing 75 lbs. of ore from the Silver Champion mine, Silver Bend district. The samples are not only beautiful in appearance but they are rich in silver. The Silver Champion is one of the earliest locations in the district. It produced rich ore from the day of its discovery, but the ledge was fractured and crumbled to a considerable depth below the surface. But at last it appears to be well defined and exhibits clean head and foot walls. In the shaft, the ledge is four feet thick, and holds good mineral. The rich stratum from which the samples were obtained lies in the center and is somewhat broken. The developments of the shaft have removed every doubt respecting the character of the Silver Champion, which is now believed to be a true, strong, and permanent vein. Five or six tons of the selected ore are to be brought for reduction at Murphy's California mill.

Dec. 13th: Last evening two bars of bullion the value of \$3,000, arrived from the Knickerbocker mill, near Iono.

The workmen in the Lane and Fuller mine are at work erecting hoisting machinery over the mine.

Very beautiful specimens of fluor spar were recently brought into this city from the American Flag mine, Mammoth district. It is said to occur in great abundance in the veinstone of that mine. The specimens furnished present a variety of colors, the most common of which are white, yellow, and very light green and rose. The crystals are in cubes and modifications, and are generally small, none of them having faces greater than three-fourths of an inch.

*Silver Bend Reporter*, Dec. 7th: Work progresses finely on the tunnel of the Northumberland mine in Northumberland district, it having been already run 180 feet. Parties in the district have recently discovered some small veins that carry an exceedingly rich quality of ore which they are engaged in extracting for reduction. It is estimated that it will yield from \$500 to \$1,000 per ton.

A small mill is now in course of erection at Columbus district. There is a large amount of rich ore visible upon the surface at Columbus, and the mill will be kept constantly employed, and if the mines develop as well as surface indications promise, the present affair will be superseded by more extensive works.

On the 30th ultimo, a lot of bullion was received at Austin from the Knickerbocker mill, near Iono, of the value of \$6,397.

**Washoe.**

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

*Virginia Enterprise*, Dec. 11th: The flood in Carson River, caused by the late rains, carried away the dams of the Mexican, Brunswick and Merrimac mills.

The new incline of the Bowers and Plato mine is now down 70 feet, and is being driven ahead night and day. Ore is still being mined in the old chambers.

The Gold Hill M. and Co. have just declared a dividend of \$7.50 per share. Their prospects are not excelled by any mine on the Comstock range.

Pembroke, Murray and others have contracted to work the Lawson and McMeans mine, on American Flat. Many assays of ore from various parts of the vein, indicate that it will pay for working.

Dec. 14th: Wells, Fargo & Co. shipped from this city and Gold Hill, during the past week, 8,035 lbs. of assayed bullion, valued at \$193,928.

Dec. 15th: The Bowers mill has been thoroughly renovated, and is now reducing ore from the Bowers mine, of which there is a large quantity on hand.

Nearly all the miners employed in the Hale & Norcross have been discharged for the present; only a sufficient number have been retained to push forward the drift which is now being run for the lead from the bottom of the shaft.

**OREGON.**

*Dalles Mountaineer*, Nov. 30th: The Canyon City correspondent writes that five tons of ore from the National ledge, retorted \$97, or about \$20 per ton, free gold, without working the sulphurets.

The I. X. L. Co., at Prairie Diggings, struck the vein in their tunnel last Saturday, with prospects more flattering than they anticipated, having run 600 ft.

Jacksonville *Sentinel*, Dec. 7th: Colonel Drew, with two others, are still driving their tunnel on Jackson Creek. The Colonel has overhauled his mill and is putting in the latest improved condensing or saving apparatus.

"You may talk to me of Baltimore and Philadelphia and New York, and their railroads and the trade of the Atlantic—let me tell you that the Pacific Coast is already beginning to revolutionize the world."—Speech of Hon. Wm. H. Seward to the people of Annapolis, Maryland, June, 1867.

**ADDRESS**

To the Permanent Citizens of the Pacific States and Territories.

Citizens:—We enjoy the finest country that the sun shines on, the most varied and fertile soil, the most extensive seaboard, and the greatest breadth of land having the richest metallic deposits possessed by any one nation of the earth, a land affording all the most varied material for manufactures, wool, hides, cotton, silk, metals, coal, fiber, gums, wood, and, above all, abundance of every kind of food.

We are only a million of people, and yet have more land and sea than Russia with sixty millions—more land than France and Germany, with their hundred millions of people. In the face of these vast resources, there are towns crumbling to decay, men seeking without finding employment. Something wrong here, or this would not be happening. Let us consider.

The instructed mind of the population is mostly devoted to political office-seeking. Their ambition is misdirected. The rising youth is trained to idleness. This mode of thinking and training must be reversed if we would hold this magnificent country against the incoming barbarian.

We must teach our youth the glories of manufactures, of commerce, of industry. We must nourish every effort, however rude, at manufacturing what we require. By devoting some of our capital and our young people to manufactures and general industries we shall soon become busy, get rich, bring more and more people into the country, create new wants, build up new factories and new villages around them; cultivate more land, build more ships, generate more commerce, and thereby create profitable employment for all who want work.

Now, fellow citizens, some money capital is required to help on this industrial movement. Where shall we get it? There is a considerable fund which we may divert from its present bed and channel, viz: the Insurance Fund.

Consider The people of the Pacific States pay two hundred thousand dollars a month to the Insurance Companies for assuring their against losses from fire and shipwreck.

There are some fifteen of those insurance offices in this city, each paying for its share of this large fund. Each office pays a heavy rent, a half dozen officers and clerks, besides printing and advertising; the lowest cost is a thousand dollars a month on each office, and with some it is double that. There are too many persons employed in the business; too much dozing over newspapers; too much red tape and circumlocution; too high salaries and too little work. Think of two hundred thousand dollars a month! two millions and a half a year!! paid to those sleepy gentlemen for what little they do. This must be reformed. Three or four insurance offices are quite enough for the million of scattered inhabitants of the Pacific States. A dozen of them may be abolished with great benefit to the community; some one or two have already withdrawn. This change would liberate some fifty men of education, whose business capacity would be of much greater service to the community in other branches of industry, such as manufactures, agriculture, commerce, the fisheries, the forests and the mines. This change would also divert a million or two of dollars to other and more useful industries, whereby a thousand fold more of national capital and employment would be generated than by the present dry system.

The managers of the Builders' Insurance propose, with the co-operation of the people, that this vast monthly amount of wealth shall be arrested and diverted to the aid of home manufactures, to effect a great reform and remove from the people's shoulders the expense of supporting a small army of insurance clerks and agents. The Builders' Insurance Company has passed through its first year (the most trying) with singular success. It has gathered a hundred thousand dollars, paid promptly all its losses, and established a business income of fully twenty thousand dollars a month! This has been done while we were yet but an experiment, and enjoying the confidence of only a portion of the public. We now appeal to the entire people. We ask them to send their insurance business to us on the following conditions, and soon we shall have an income of ONE HUNDRED THOUSAND DOLLARS A MONTH, and here is what we shall do with the money.

First, we calculate, from our past experience, that we shall lose by fire and marine disasters half our monthly income (on our first year's experience our losses were but one-third of our income).

Suppose, then, that our income shall be worked up to one hundred thousand dollars a month, and suppose that we shall pay out losses to the extent of fifty thousand dollars a month, we shall still have fifty thousand dollars a month to bank up, (or half a million a year.) We propose to make two parts of this sum—one part (a quarter of a million a year) to be invested in City Bonds, to protect the assured, and one part (about a quarter of a million a year) we propose to convert into a

**MANUFACTURERS' LOAN FUND,**

Which shall be lent exclusively to manufacturers on mortgage of their premises and machinery, at as low rate of interest and on as long time as is generally current on real estate.

By the aid of this fund the budding industries of the Pacific States may be nourished into active life; more and varied employments can be originated for the people; immigration may be welcomed and not feared; the farmer will have got a market at his own door for the produce of his land; the manufacturer will find a lively home demand from the farmer for the products of his machines.

All this, good people, can be achieved, by your own votes at your own free will, without the aid of Congress or the Legis-

lature—it is simply to vote that your insurance shall go to the Builders, by which vote you shall enable us to plant factories all over the country. You shall fill the rivers and harbors with busy ships; you shall send out upon the distant waves fishing expeditions that will bring back wealth to your cities; you shall form a nursery of seamen around your own shores—the oars of a future commerce and a protective navy; you will create the hum of busy workmen in every desirable locality on the Pacific Coast; you will bring from neglected fields produce of the utmost value; all of which will most certainly multiply a thousand fold the wealth of the country in which your lot is cast, making a worthy home for yourself and a future country for your offspring.

People of the Pacific States and Territories! We pledge ourselves to you to effect, with your co-operation, some of those things. We have kept all our pledges so far, and have uttered nothing that was not true. Already have we helped to move the shuttle and the loom, which others, with more means, have passed by and neglected. Already have we helped to build and rig ships in our own dock-yards, and sent them over the wide waves in search of riches for the city. Already have we given many liberal bounties and donations to the deserving institutions of the city. Give your vote to the Builders, and we shall share its profits with every useful charity and every honest industry, and help along every enterprise that promises benefit to the people.

We call for the yeas and nays.

THOMAS MOONEY, President.

## Canvassing Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. Jan. 11, 1866.

Mr. C. T. Raney is our duly authorized agent for Sacramento County. Nov. 29, 1867.

Dr. L. G. Yates is our duly authorized traveling agent. July 6, 1867.

Mr. A. B. Butler is a duly authorized travelling agent for this paper. July 15, 1867.

Mr. H. C. Northrop, is our duly authorized agent for Oregon, Washington, Idaho, and Montana. Aug. 17.

## San Francisco:

Saturday Morning, Dec. 21, 1867.

## Notices to Correspondents.

**VULCAN.**—The largest locomotive machines in the world are employed in Belgium and France, more particularly the latter country. Perhaps one of the most titanic proportions is that recently exhibited at the lately closed Paris Exhibition. It consisted of a tank-engine, intended for the goods traffic of the Aurillac and Murat section of the Paris and Orleans Railway, on which there are gradients of 1 in 33, and curves of fifteen radius. It has ten wheels, all coupled, and divided into groups of two pairs each, before and behind the central driving wheels. Wheel base, 14 feet 10½ inches; weight, loaded, 59 tons 12 cwt.; empty, 46 tons (of 2240 lbs.) 15 cwt. The boiler, tires and piston-rods are of cast steel, the frames, axles and springs of Bessemer steel.

**PHILO.**—Goreham is not derived from Gotham; the one means the home or dwelling of the Gore, or wedge-shaped field; the other signifies the dwelling of the Goth. The term gore is only now used by ladies' in shaping their garments by the aid of triangular slips, as we understand is now the fashion in forming ladies dresses, and also by plowmen who, in forming their ridges occasionally find themselves compelled to make one or more in the form of a gore, in order to produce uniformity among the remainder. Ham is an abbreviation of the Teutonic word "heim," as Annaheim and the Lowland Scotch and North of England word "hame." As an illustration, we may give the words of Burns' Tam O'Shanter:

"Na'e thinking a' the lang Scots miles,  
The mosses, waters, slanes, and stiles,  
That lie between us and our hame,  
Where sits our sullen sulky dame,  
Gathering her broos' like gathering storm;  
Nursing her wrath to keep it warm."

**GLUCONE.**—The most violent explosive substance known is the chloride of nitrogen, a grain and a half producing, when ignited, an explosion which yields a report louder than a common gun. The preparation and handling of this body require the greatest caution. The glass jar in which it is prepared should be treated with caustic potash or soda in order to free it from every trace of fat, as even grease from the fingers has been known to cause an explosion, which, however, sometimes takes place spontaneously without any apparent cause.

**BRINE.**—A combination of chloride and water known to chemists under the denomination of hydrate of chlorine, is composed of one atom of chlorine (35.4) added to 10 atoms (90) of water. It is formed by exposing a vessel filled with chlorine gas and a quantity of water less than will be sufficient to absorb all the chlorine when exposed to a temperature below the freezing point for some days, when an arborescent, crystalline pale yellow translucent mass is formed. When exposed to the air, and gently warmed, it effervesces, gaseous chlorine is evolved and water impregnated with chlorine remains.

**B. G.**—By-Laws were originally so called in consequence of their being laws and customs of a limited locality, such as a village; the term being derived from two Danish words, *By*, a village or small town, and *Lage*, law, a by-path or way originally meant the path or way to a small assemblage of houses in contradistinction to the main or highway.

302 Montgomery street, corner of Pine.

## A New Mining Bill.

Mr. Rollins, of Nevada County, has introduced Assembly Bill No. 43, entitled "An Act for the Encouragement of Mining." This Bill repeals the present law in relation to partnerships for mining purposes, and substitutes a more summary mode of extinguishing the title of non-acting or non-paying claim owners, for the benefit of those who are copartners or tenants in common with them, and who desire to develop their claims. The law proposed to be repealed is certainly one which needs material alteration to avoid the delays incident to a strict compliance with its provisions; but it would be a serious mistake in the Legislature to repeal a law applicable to both corporations and simple partnerships, for the collection of assessments and extinguishment of delinquent interests, by a substitute which applies only to corporations; thus compelling all mining companies to incorporate to avail themselves of the facilities for the extinguishment of the title of non-paying partners. There is a strong objection among miners generally, and not without good foundation, against incorporating, and it is not right that they should be forced to incorporate to secure protection against non-paying partners.

This bill provides that—"when three or more persons owning or claiming as joint tenants, tenants in common, or copartners, a majority of the number of feet, shares or interests in any mining claim in this State, shall have formed or shall hereafter form themselves into a corporation or organized association for the purpose of working or developing such mining claim, and shall actually proceed to work and develop the same, such corporation or association may, without demand, except by commencement of action, institute a suit in any Court of competent jurisdiction, in its corporate or associate name, as upon an implied contract for the payment of money, against any person not a stockholder in or member of such corporation, owning or claiming to own in such mining claim as joint tenants, etc., for his or her proportion of the money actually expended or indebtedness assumed by such corporation or association, in the actual and necessary working and development of said mining claim."

It further provides that defendants shall have three weeks' notice prior to the institution of suit, either personally or by publication in the usual way, whether the defendants be residents or non-residents; and that the summons shall be served as in other cases, except that thirty days' publication shall be sufficient in any case. It also provides that the interest of the defendant in said claim shall be the *only property* belonging to him subject to levy and sale on the execution upon the judgment rendered, and that the sale shall be absolute, leaving no right of redemption.

Some such modification of the law now in force is needed, and if the interests of those companies who do not wish to incorporate are protected, we see no reason why the present bill, so amended, should not pass.

THE PACIFIC MAIL STEAMSHIP ELECTION, which took place in New York on the 18th inst., resulted substantially in the re-election of the present Board of Managers—six out of nine being retained. The stormy opposition which had been gotten up with, apparently, no other object than to secure, for an untried set of men, the management of this great commercial enterprise, had elicited much interest in the result. Business men everywhere, and especially in California, as well as the traveling public, are highly pleased to see the present tried and experienced managers retained in their places. We would mention, in this connection, that the last mail brought intelligence of the successful launching of another magnificent steamer for this line on the Atlantic side—the *Alaska*. Another, the fourth ship, has also been commenced for the China line. No other steamship company in the world has ever made so splendid or successful a record as the P. M. S. Co. Its affairs will never be entrusted to able or more fitting managers than those which are now at its head.

## Young Peoples' Social and Literary Societies in San Francisco.

Among the most pleasant, profitable and useful institutions in this city, may be mentioned the social and literary societies connected with most of our metropolitan churches. The young people of high moral and liberal religious proclivities in this city, have banded themselves together for the double purpose of social enjoyment and improvement among themselves, and to bring under social and home-like influences the hundreds of young men who are constantly arriving in this city as strangers, from almost all parts of the world. These societies are becoming quite a feature among our institutions; a fact which is abundantly attested by their rapid growth and increased popularity. The need of such organizations in a city like San Francisco is only too apparent, while the real good they accomplish, and the pleasant associations they engender, are evident to all who take an active interest in their progress. Our population is continually changing, and the constant arrival of new comers makes it necessary that extra efforts should be exerted to bring within the refining influences of a home-like circle the many young men who, having left behind, in the Eastern States and elsewhere, the pleasant associations of home and kindred, sadly long for a kind reception in this land of their adoption.

If such young men are introduced into some one of these societies, and feel once more the pleasant influences of social gatherings, they are at once led to choose their companions from among the good and virtuous, and are thus saved from the snares which constantly beset the youth in large cities. Then, too, those who have long lived here, and have sighed for the opportunity to spend an evening in visiting some family circle, as they were accustomed to in their Eastern homes, find in these gatherings the friends they need so much, and are prevented from seeking among scenes of dissipation and vice the gratification of this long yearning which must be satisfied in one way or another.

Another object of these organizations is to bring together in social intercourse the young people of the different churches for mutual introduction and acquaintance. The so-called "sociables" which used to be held semi-occasionally, have almost entirely been superseded by these pleasant gatherings.

Although sociability is the leading purpose and design of these meetings, musical and literary exercises contribute largely to the attractiveness of the entertainment. Instrumental and vocal music form a prominent part of the programme, while the instructive addresses, recitations, interesting essays and select readings, with the contents of their spicy journals, complete a performance highly creditable to the societies, and always appreciated by their friends.

There is no reason why this auspicious tri-partite alliance between sociality, literary improvement and the church, for the promotion of virtue, knowledge and religion, should not be established in every important city and town in the State. Our neighboring city of Oakland has already established an association of this kind, and possibly some other localities may have done the same. Wherever they may be found, if properly conducted, they will not fail to bear good fruit. We desire to mention each one in this city separately by name, as eminently worthy of consideration. There are in all eight, as follows:

**The First Congregational.**—The Young People's Social and Literary Society of the First Congregational Church, is the pioneer society established here, having been organized July 21st, 1864. It is in a most flourishing condition. The first entertainment was given on the evening of Sept. 1st following, and proved, beyond a doubt, the success of such societies. At first the meetings were held in private houses; but the Society increased so rapidly that even the most commodious parlors were found to be

quite too small to accommodate all who wished to attend these gatherings; and since June, 1865, the meetings have been held in the lecture-room of the church, on the corner of Dupont and California streets, on the third Thursday evening of every month. There are altogether about 200 members. The expenses of the Society are paid by the gentlemen; the pleasure of the ladies' presence at the meetings being considered more than sufficient remuneration to the organization. These meetings are always well attended, and the exercises are highly interesting, evincing a degree of talent of which societies of greater pretensions might well feel proud.

This Society has shown considerable enterprise in the publication of a monthly journal, entitled the *Social Voices*, which consists of eight pages. The *Social Voices* is published by Messrs. Truesdell, Dewey & Co., at the office of the MINING AND SCIENTIFIC PRESS, and its typographical appearance and contents, every article of which is original, make it a perfect little gem in its way. There are few papers of its size which contain so much readable matter. This, we believe, is the only society of its kind in the United States (or in the world beside, for that matter), which publishes a printed paper; showing in this respect more enterprise than those in the more favored parts of our country.

**The Second Congregational.**—This Society was organized in December, 1865. The total number of members is about 45. The meetings are held in the church on the second Tuesday evening of every month. *Our Ideas* is the name of the paper published by the Society, which is written, but not printed.

**The Fourth Congregational** was organized December, 1866; number of members about 30. The meetings are held at private residences, on the second Thursday evening of each month. Their written journal is called the *Monthly Portfolio*.

**The Howard Social and Literary Society** was organized April 5th, 1866. It numbers 155 members. The meetings are held on the first Thursday evening of each month, at private residences. This Society issues a quarterly publication in magazine form; best selections from their monthly (written) journal, *The Social Circle*, being published in this edition.

**The First Presbyterian Social and Literary Society** was organized June 10th, 1867; number of members 60. The meetings are held at private residences on the first Tuesday evening of each month. In this Society, and this one only, the ladies insist on paying dues, voting in the meetings, and enjoying the inalienable rights and privileges allowed the sterner sex. The name of their (written) monthly journal is *The Gem*.

**The Calvary Literary Society** was organized May 20th, 1867, and numbers 100 members. The pastor of Calvary Church is Honorary President, while among its members it numbers the Governor of the State, the Ex-Mayor, and ex-candidate for Mayor, who did not get elected, besides prominent merchants of the city. The meetings are held in the church on the first Monday evening of each month.

**The Baptist Union**, composed of the First, Second and Tabernacle Baptist Churches, was organized April 16th, 1867, and numbers about 50 members; but few of the ladies being enrolled as members, though many attend the meetings and take part in the exercises. Besides the social and literary labors of the Society, they combine city missionary work, and appoint their committees, who report at stated times to the Society. The meetings are held in the church on the Tuesday evening following the second Sabbath of each month.

**The Powell Street Literary Society** was organized April, 1867, and numbers about 40 members. The meetings are held every alternate Friday evening. The secretaryship is filled by a lady member.

It will be seen from the foregoing that these societies are in a flourishing condition, and one would be more than repaid in attending any of the several meetings, held at the various times and localities mentioned.

**MR. KUSTEL'S NEW BOOK**—The Concentration of Ores, the Chlorination Process, etc.—will be ready for sale and delivery by the first of January. We give this general answer to numerous inquiries, which we are constantly receiving with regard to the time when that work will appear.

**ANOTHER OIL MILL.**—O. H. Allen has just erected an oil mill in Los Angeles, for the manufacture of castor oil. His mill is of a capacity of forty gallons per day.

**THE COLLEGE ECHO.**—We have received the first number of a publication bearing the above title, to be published monthly as the literary organ of the graduates and undergraduates of the College of California, of Oakland, and as a vehicle for College news generally. The paper is a small, neatly printed folio, and has grown out of a weekly written paper, which has been read weekly for some years before a literary society connected with the College, and which has now culminated in the present printed sheet. The custom of issuing weekly or monthly printed papers at the various literary institutions is becoming quite general throughout the country. Such journals, properly conducted, may be made both useful and interesting. Judging from the character of the initial number of the *Echo*, we venture the prediction that it will not fail to accomplish the proper object of its mission.

**NORTH AMERICA**  
**Life Insurance Company.**  
Usual Restrictions on Occupation and Travel  
**ABOLISHED!**  
Policies of this Company are guaranteed by the State of New York, which is true of no other Company on this Coast.

**HUNGERFORD'S**  
**Improved Concentrators.**  
MR. HUNGERFORD, having been absent in the Interior during the summer months, and engaged in the construction of several Quartz Mills, which have also been supplied with his CONCENTRATORS, has now returned to this city, and is prepared to answer all orders for his Concentrators, which are built either at the Miners' Foundry, in this city, or at Ooss & Lombard's, in Sacramento.  
Orders addressed to him at this city, by mail or express, will be promptly attended to.  
25v15tr MORGAN HUNGERFORD.

**HENDY'S**  
**LATEST IMPROVED PATENT SELF-DISCHARGING SULPHURETS**  
**CONCENTRATOR.**

**FOR GOLD AND SILVER ORES,**  
With Revolving Stirrers and Rotary Distributor.  
This machine is designed for saving finely divided Quicksilver, Amalgam and Gold from the sands, and for concentrating and saving the Sulphurets. Any person of ordinary experience with Quartz Mills can readily fit them up and run them.  
Those in want of Concentrators would do well to visit some of the quartz mills that have Hendy's Patent Concentrators in use, and satisfy themselves before purchasing other Concentrators of pretended merit. **THEY ARE WARRANTED TO WORK SATISFACTORILY.**

**Directions for Operating Hendy's Concentrators:**  
The sulphurets are drawn off while the Concentrator is in motion, in the following manner:  
FIRST—In setting up, set the pan, A, level by the inner rim, near its center.  
SECOND—While in operation, keep the Pan, A, about half full of sulphurets.  
THIRD—Open the gate, E, sufficiently to discharge the sulphurets as they accumulate over the amount above mentioned.  
FOURTH—The crank shaft to make 200 to 220 revolutions per minute.

**References:**  
Reference is made to the following mills, which have HENDY'S CONCENTRATORS in use:  
EMPIRE MILL. (7 Concentrators)..... Grass Valley, Nevada County.  
NORTH STAR M. & M. CO. (4 Concentrators)..... Grass Valley, Nevada County.  
NORRIDGEWOCK MILL. (2 Concentrators)..... Grass Valley, Nevada County.  
VALENTINE & CO., Commercial Mill (3 Concentrators)..... Nevada County.  
HUMBOLDT CANAL CO. (1 Concentrator)..... Humboldt County, Nevada.  
ROBINSON & McALLISTER M. & M. CO. (3 Concentrators) Hunter's Valley, Mariposa County.  
PLYMOUTH ROCK MILL CO. (2 Concentrators)..... Calaveras County.  
MIDAS MILL CO. (4 Concentrators)..... Virginia, Montana.  
GOULD & CURRY G. & S. M. CO. (4 Concentrators)..... Virginia City, Nevada.  
VULTURE CO. (8 Concentrators)..... Prescott, Arizona.  
NOYES & CO'S MILL. (2 Concentrators)..... Prescott, Arizona.  
LUCY MINING CO. (3 Concentrators)..... Owyhee District, Idaho.  
MOREY & SPERRY (1 Concentrator)..... New York.  
GUADALUPE & SACRAMENTO G. & S. M. CO..... Sinaloa, Mexico.  
EL TASTE CO. (2 Concentrators)..... Sonora, Mexico.  
B. F. BROWN (1 Concentrator)..... Melbourne, Australia.  
And in use in many other parts of this coast.

The following give additional proof of the increasing popularity of the machine:  
SAN FRANCISCO, October 10th, 1867.  
J. HENDY, ESQ.—Dear Sir:—To your request for an expression, in writing, of my opinion in regard to the merits of your Concentrator, I reply, that I consider it the best machine for saving quicksilver and amalgam, and for concentrating sulphurets, that I have ever used, or seen used. I may add, that I could give you no stronger proof of this than to order, as I did, six more of them, after a trial of one for several months. I shall take pleasure in showing the machine in operation to any one interested, who will call at the mill of the Empire Company, in Grass Valley. Yours,  
S. W. LEE, Supt.

SUPERINTENDENT'S OFFICE, GOULD & CURRY S. M. Co.,  
VIRGINIA CITY, Nev., Sept. 17, 1867.  
JOSHUA HENDY, Esq., San Francisco:—Dear Sir:—According to the terms under which I secured from you four (4) of your Concentrators, namely—that they were to be paid for only after a thorough trial had demonstrated their value—I desire to inform you that I have tried them, and have found them to work very satisfactorily, and that they will now be accepted by the Company. You will please present the bill for said Concentrators, say \$1,200, at the office of the Gould & Curry Company in San Francisco.  
Yours, very truly,  
LOUIS JANIN, Jr.  
The bill was presented in accordance with the above request, and duly paid.

Four Concentrators have been forwarded to the Vulture mine, in Arizona, which makes eight for that mill. The additional order for four machines was made after a thorough trial, which proved their superiority over all others. [See Mining and Scientific Press of Dec. 14th.]

**CAUTION.**  
All of HENDY'S PATENT CONCENTRATORS are marked thus:  
"J. HENDY, Patented February 27th and April 17th, 1866."

**Perry Davis' Vegetable Pain Killer.**  
Sudden colds, coughs, etc., can be cured immediately, as hundreds can testify, by mixing about one teaspoonful of Perry Davis' Vegetable Pain Killer with four tablespoonfuls of molasses, mixed well together, and taken as your coughing spell comes on; three teaspoonfuls of the mixture will answer for a dose. Also rub a little of the Pain Killer on the hands, and inhale the scent of it into the lungs. After you have taken the medicine, bathe the throat and around the collar-bone, also across the upper part of the breast and down the sides, if they have been made sore by coughing, and you will soon get relief if you do not neglect it too long. The sooner the medicine is applied, the more speedy the relief. In all cases, if you do not get relief in thirty minutes, take it again, and bathe freely according to directions.  
Prices, 25 cents, 50 cents, and \$1 per bottle.  
Sold by all Druggists, Grocers and Medicine Dealers everywhere. declm

**Legitimate Photography**  
OUR SPECIALTY.  
THE FIRST PREMIUM AWARDED AT the late State Fair for the best plain Photographs, and a special premium for the best Cabinet Portraits, to SILAS SELLECK, 415 Montgomery street. Prices reduced to conform to Association rules. Patent secured. 25v15-6m

**Foundry for Sale.**

18v13-ly One block north of Couch's Wharf.

**UNION IRON WORKS,**  
Sacramento.  
**WILLIAMS, ROOT & NEILSON,**  
MANUFACTURERS OF  
CROSS' PATENT BOILER FEEDER,  
STEAM ENGINES, BOILERS,  
And all kinds of Mining Machinery.  
Also, Hay and Wine Presses made and repaired with neatness, durability and dispatch.  
Dunbar's Patent Self-Adjusting Steam Piston Packing, for new and old cylinders, manufactured to order.  
Front Street, between N and O streets,  
14v11 SACRAMENTO CITY

**I. H. SMALL,**  
MACHINE SHOP,  
BUILDER OF  
Steam Engines, Sawmills, Mining Machinery, and Wood Planers.  
Repairing of all kinds done with promptness and dispatch  
Gears of all kinds cut at short notice, corner of Market and Beale st. San Francisco. 6v15-3m

**GLOBE**  
Foundry and Machine Shop,  
STOCKTON, CAL.  
**KEEP, BLAKE & CO.,**  
MANUFACTURERS OF  
Quartz, Saw and Grist Mill Irons, Steam Engines, Horse Powers,  
Mining and Irrigating Pumps, Car Wheels, Derrick Irons, House Fronts, Iron Fencing, Balcony Railings, etc., at San Francisco prices. Orders solicited  
18v13-ly and promptly executed.

**GEORGE T. PRACY,**  
MACHINE WORKS,  
Nos 109 and 111 Mission street, between Main and Spear,  
SAN FRANCISCO.  
STEAM ENGINE, FLOUR AND SAW MILL  
And Quartz Machinery, Printing Presses,  
—AND—  
MACHINERY OF EVERY DESCRIPTION MADE AND REPAIRED.  
Special attention paid to Repairing. 4v7-3

**SAN FRANCISCO**  
Foundry and Machine Works,  
N. E. Cor. Fremont and Mission streets,  
Manufacturers of  
Marine and Stationery Engines  
Quartz Machinery, Saw, Flour and Sugar Mills, Mining Pumps, Hoisting Gear, Agricultural Implements, etc.  
—ALSO—  
Wine, Cider, Cotton and Tobacco Presses of the latest Improved Patterns.

**STEAM ENGINES AND BOILERS,**  
Of all sizes, constantly on hand; Quartz Mill Shoes and Dies warranted to be made of the best white iron.  
Dunbar's Improved Self-Adjusting Piston Packing, requires no springs or screws; is always steam-tight; without excessive friction, and never gets slack or leaky.  
MACHINERY OF ALL DESCRIPTIONS Bought, sold, or exchanged. Bolt, Cutting and Castings at the lowest market rates.  
6v11-ly **DEVORE, DINSMORE & CO**

**LEWIS COFFEY,** J. S. RISDON  
**LEWIS COFFEY & RISDON,**  
Steam Boiler & Sheet Iron Works.  
THE only exclusively Boiler Making establishment on the Pacific Coast owned and conducted by Practical Boiler Makers. All orders for New Work and the repairing of Old Work, executed as ordered, and warranted as to quality.  
Old Stand, corner of Bush and Market streets, opposite Oriental Hotel, San Francisco.

**CALIFORNIA BRASS FOUNDRY.**  
No. 125 First street, opposite Minna,

ELECTROTYPE CUTS, ENGRAVINGS, Etc.—Our Job Printing Office is abundantly supplied with elegant engravings, of name-cards and other embellishments to suit the various branches of industry in this State.

THE LARGEST WAR VESSEL afloat is said to be the steam frigate Wampagoag, which will soon make a trial trip from the Brooklyn Navy Yard. She is 354 feet long. Her engines and boilers occupy 160 feet of this length; her engines are in the aggregate of 5,000-horse power, having two 100-inch cylinders, eight main boilers, and two super-heaters. She carries ten 9-inch Dahlgren, two 100-pound Parrots forward, and two howitzers aft. Her full complement of men is about 500, and of these she has now on board 418, all told. The engineer's department alone calls for 160 men, and 120 are now at work.

THE SNOW LINE.—The Nevada Gazette of Tuesday last says: "The snow line at present commences a short distance above Graniteville. A few days since it was a foot to eighteen inches in depth in the Meadow Lake region and from two to three feet in depth at the summit." If the rain storm, which set in last evening continues, we may look for high water again.

A COIN of Philip of Macedon is on exhibition in Washington. It is about the size of a half eagle, and is twenty-two hundred years old.

**Rates of Postage on Printed Matter to Europe and Asia.**

The Post Office Department has made arrangements by which a number of European and Asiatic countries, hitherto beyond the reach of our mail communication except by letter, are brought within the range of delivery of all, or nearly all, United States mail matter. It is a singular fact, unknown probably to most persons who have not occasion to learn it by unpleasant experience, that there was a considerable region in the civilized world where an American traveler might not receive a newspaper directly from home.  
Under the arrangement now completed, prepayment of postage (sometimes at high rates), is made necessary in all cases. The following official statement gives a full list of the countries—with some of which there has been regular communication—but are now included in the delivery by way of Hamburg and Bremen:  
Kates of postage on newspapers and other printed matter (periodicals, etc.) sent from the United States to countries in Europe and Asia, by Bremen or Hamburg mail—prepayment compulsory:  
NEWSPAPERS—MAILED AS FOLLOWS:  
Bremen, by Bremen mail—2 cents each.  
Hamburg, by Hamburg mail—2 cents each.  
Prussia, Austria and German States, by Bremen and Hamburg mail—3 cents each.  
Lunenburg, by Bremen mail—3 cents each.  
Lunenburg, by Hamburg mail—3 cents each and 1 cent per 1/2 ounce.  
Schleswig Holstein and Denmark, by Bremen or Hamburg mail—3 cents each and 1 cent per 1/2 ounce.  
Sweden, by Bremen or Hamburg—3 cents each, and 1/2 cent per 1/2 ounce.  
Norway, by Bremen or Hamburg—3 cents each, and 3/4 cent per 1/2 ounce.  
Holland, by Bremen or Hamburg—3 cents each, and 1 cent per 1/2 ounce.  
Russia, by Bremen or Hamburg—3 cents each, and 1 cent per 1/2 ounce.  
Switzerland, by Bremen or Hamburg—4 cents each.  
Italy, by Bremen or Hamburg—5 cents each.  
Turkey, by Bremen or Hamburg—3 cents each, and 6 1/2 cents per 1/2 ounce.  
Greece, by Bremen or Hamburg—3 cents each, and 6 1/2 cents per 1/2 ounce.  
Gibraltar, Spain and Portugal, by Bremen or Hamburg—3 cents each, and 2 1/2 cents per 1/2 ounce.  
Austria, India and China, by Bremen or Hamburg mail via Marseilles—3 cents each, and 9 cents per 1/2 ounce.  
Austria, India and China, by Bremen and Hamburg mails, via Trieste—3 cents each, and 2 cents per 1/2 ounce.

PERIODICALS, ETC.  
Bremen, by Bremen mail—1 cent per ounce.  
Hamburg, by Hamburg mail—1 cent per ounce.  
Prussia, Austria and German States, by Bremen or Hamburg—1/2 cent per ounce.  
Lunenburg, by Bremen mail—1 1/2 cent per ounce, and 1/2 cent per 1/2 ounce.  
Lunenburg, by Hamburg mail—1 1/2 cent per ounce, and 1/2 cent per 1/2 ounce.  
Schleswig Holstein and Denmark, by Bremen or Hamburg—1 1/2 cent per ounce and 1/2 cent per 1/2 ounce.  
Sweden, by Bremen or Hamburg—1 1/2 cent per ounce, and 2 cents per 1/2 ounce.  
Norway, by Bremen or Hamburg—1 1/2 cent per ounce, and 4 cents per 1/2 ounce.  
Holland, by Bremen or Hamburg—1 1/2 cent per ounce, and 1 1/2 cent per 1/2 ounce.  
Russia, by Bremen or Hamburg—1 1/2 cent per ounce, and 2 cents per 1/2 ounce.  
Switzerland, by Bremen or Hamburg—1 1/2 cent per ounce, and 1 cent per 1/2 ounce.  
Italy, by Bremen or Hamburg—1 1/2 cent per ounce, and 2 cents per 1/2 ounce.  
Turkey, by Bremen or Hamburg—1 1/2 cent per ounce, and 5 1/2 cents per 1/2 ounce.  
Greece, by Bremen or Hamburg—1 1/2 cent per ounce, and 6 1/2 cents per 1/2 ounce.  
Gibraltar, Spain and Portugal, by Bremen or Hamburg—1 1/2 cent per ounce, and 2 1/2 cents per 1/2 ounce.  
Austria, India and China, by Bremen or Hamburg mail, by way of Marseilles—1 1/2 cent per ounce, and 9 cents per 1/2 ounce.  
Austria, India and China, by Bremen or Hamburg mail, by way of Trieste—1 1/2 cent per ounce, and 2 cents per 1/2 ounce.

5v15-4y

**GOLD IN ALASKA.**—A correspondent of the *Alta*, of this city, writing from Sitka, says that gold is known to exist in paying quantities on the Stikeen river, where mining has been carried on to a considerable extent for the last five or six years. It has also been found on several other streams in the southern part of Alaska, but not in large quantities. In 1860, a French trapper, found at "Bucks Bar," 190 miles from the mouth of the Stikeen, a placer which paid him an ounce per day. Several paying bars were also discovered in 1861 in the vicinity of Shakes Creek. The average yield with a common rocker, is \$3 per day. There is no bedrock on the Stikeen, the gold being found in a stratum three ft. below the surface.

On Copper river, which empties into the Pacific, west of Mount St. Elias, native copper is found in large masses. Copper is also found in some of the western Kurilo islands.

**OPPOSED TO POSTAGE STAMPS.**—It is said that the use of postage stamps is to be discouraged by the P. O. Department, which will in future issue only stamped envelopes. These will be issued of all sizes and of all rates of postage; and, to encourage their general use, they will be sent to any address, when 500 are ordered, with the printed notifications on the back to return to the writer, if not called for at a specified time. This remaining, also, will be done free of postage. The change is no doubt made in consequence of the facilities offered for cleaning and using our old stamps; or, perhaps, somebody wants a big contract for the manufacture of envelopes.

**NEWSPAPER POSTAGE TO AUSTRALIA.**—Postage on newspapers to Australia and New Zealand has been reduced to four cents per copy.

**All About Sending Money by Mail.**

**RATES OF COMMISSION.**—The following are the rates charged (in currency) for transmitting money to any part of the United States:

On Orders not exceeding \$20, ..... 10 cents.  
Over \$20 and not exceeding \$50, ..... 25 cents.  
No fractions of cents to be introduced in an Order. United States Treasury Notes, or National Bank Notes only received or paid.

To send over \$50, additional Orders must be obtained. Post Offices where Money Orders may be obtained will furnish blanks as follows, which the applicants will fill out: No. .... Amount .... Date, .... 186 ..

**MONEY ORDER.**

Required for the sum of \$.... Payable at ..... State of ..... Payable to ..... Residing at ..... State of ..... Sent by ..... Residing at ..... State of ..... Entered in Register: ..... Postmaster.

The applicant must, in all cases, write his own given name and surname in full, and when the given name of the payee is known, it should be so stated; otherwise initials may be used. The given names of married women must be stated, and not those of their husbands. For example: Mrs. Mary Brown must not be described as Mrs. William Brown.

Sums of parties and places, and the sums, to be written in the plainest possible manner. As there are several places of the same name in the United States, applicants must be careful to indicate which of them they mean; and the Postmaster will initiate himself, before writing out the order, that the place indicated is the one intended.

List of Money-Order Post Offices in the Pacific States and Territories, May 20, 1867.

**THE GOLDEN ERA.**  
Founded in 1852, it is the oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent.

**THE GOLDEN ERA**  
Is the most universally popular of all the Weekly Journals. It presents forty-eight columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected matter. It is a welcome guest in Cottage and Cabin; the favorite at the fireside in city and country; the most useful, agreeable and altogether desirable publication for California readers and their kladred and friends in the Atlantic States, Europe and elsewhere. Every household in the mountains and valleys, the cities, towns and mining camps of California, and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor. Inspired with the genius of the age, it is progressive, and aims not so much at distinction as a newspaper, as at honorable success in its capacity of a great Moralizing and Improving Influence. Exercising a positive power for good, and wielding a permanent influence, many able and eminent writers choose its columns as a means of communicating with the public. No effort will be spared to make it a thoroughly California newspaper, and worthy of the support of all classes of our citizens.

**Our Patent Agency.**  
 The PATENT AGENCY OF THE MINING AND SCIENTIFIC PRESS  
 has been signalized with remarkable success during the  
 past two years. The importance to the inventive genius of  
 this coast of a thorough and reliable agency for the solici-  
 tation of LETTERS PATENT from the United States and foreign  
 Governments cannot be over-rated, and the Proprietors of the  
 Press, feeling the responsibility which rests upon them, and  
 the reward which must follow the faithful performance of  
 their trusts, will take care to afford inventors every advan-  
 tage to be secured to them through a competent and re-  
 sponsible agency upon this coast.

**MINING AND SCIENTIFIC PRESS.**—This valuable journal has  
 closed its fourteenth volume and entered upon its fifteenth.  
 It is a publication that should have a wide circulation  
 among our mining and mechanical population. It pub-  
 lishes, in addition to the most complete summary of mining  
 news, a vast amount of information on the application of  
 science to mining and the mechanic arts. It contains no-  
 tices and descriptions of all new mining processes, and all  
 machines intended to facilitate the extraction of the pre-  
 cious metal from ore and rock with which it is blended. It  
 also chronicles all new inventions, and, in most instances,  
 contains drawings to illustrate them. To miners and me-  
 chanics it is a paper of incalculable value, and should be in  
 the hands of all who desire to keep themselves posted in  
 the progress being made in these departments.—*Eureka*  
*Union.*

**Postage.**—The postage on the MINING AND SCIENTIFIC  
 Press to any portion of the United States is twenty cents per  
 annum, or five cents per quarter, payable in advance at the  
 Post Office delivering the paper. Postage free in the city  
 and county. Foreign postage (with few exceptions) two  
 cents per copy, prepaid. To Bremen and the German  
 States (marked via Bremen and Hamburg line), three cents  
 per copy, prepaid. Single copies can be addressed in the United  
 States, two cents.

**Professional Cards.**

 en; \$4 per hundred—postage paid.  
 Pamphlet containing the Law and the Instruc-  
 tions of the General Land Commissioner, post  
 paid, 25 cts. Address **DEWEY & CO.,**  
 Mining and Scientific Press, San Francisco.

**Generous Compliments.**  
 The following is a sample of the generous acknowledgments  
 which we frequently receive. We can only return thanks  
 for such gentlemanly obligations, and assure our friends of  
 our best endeavors to merit their respect and kindness:  
 OREGON-TOWN, January 22, '67.  
 MESSRS. DEWEY & CO.—Sirs: I have the honor to ac-  
 knowledge receipt of your letter of the 21st instant, trans-  
 mitting to me "Letters Patent" on my application for  
 you for an "Improved Machine for Washing Ores."  
 It came to hand safely, and I am pleased to tender you my  
 grateful acknowledgments for your success on my behalf.  
 Very truly yours,  
 M. A. WOODSIDE.

Save Your Teeth.—Do not have them extracted without first consulting a good Dentist. The loss is irreparable, and in many instances, unnecessary. DR. BEERS, corner of Montgomery and Sutter streets, over Tucker's Jewelry Store, makes a specialty of filling the fangs of dead Teeth, and building up broken crowns with new ones—thus restoring them to their original usefulness and beauty. Call and examine the work. Finest quality of artificial work also manufactured. 1614 if

New Mining Advertisements.

Hope Gravel Mining Company.—Location of Works and Property: Grass Valley, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the sixteenth day of December, 1867, an assessment (No. 19) of one dollar per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to David Wilder, Secretary, at No. 613 Kearny street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the twenty-second day of January, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the tenth day of February, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

DAVID WILDER, Secretary.

Office, No. 533 Kearny street, corner of Sacramento, San Francisco, California. dec21

I. X. L. Gold and Silver Mining Company.—Location of Mine: Silver Mountain District, Alpine County, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twelfth (12th) day of December, 1867, an assessment of one dollar and fifty cents (\$1.50) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his Office, Pioneer Hall, Montgomery street, near Jackson, San Francisco, or to John G. Silver, at Silver Mountain, California.

Any stock upon which said assessment shall remain unpaid on the eighteenth (18th) day of January, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the sixth day of February, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. CROWNSHIELD, Secretary.

Office, Pioneer Hall, Montgomery street, up stairs, San Francisco. dec21

Old Colony Silver Mining Company.—Location of Works: Austin, Lander County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the nineteenth day of December, 1867, an assessment of two dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his Office, No. 523 Montgomery street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the twenty-sixth day of January, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the twelfth day of February, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

HENRY O. HOWARD, Secretary.

Office, 523 Montgomery street, San Francisco. dec21

Rippon Gold and Silver Mining Company.—Location of Works: Silver Mountain Mining District, Alpine County, State of California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the seventeenth day of December, 1867, an assessment of fifty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, No. 87 Stevenson street, between First and Second streets, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the twenty-second day of January, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the eighth day of February, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the eighteenth day of November, 1867, an assessment (No. 25) of fifty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, or to the Superintendent at the mine.

Any stock upon which said assessment shall remain unpaid on the twenty-sixth day of December, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the thirteenth day of January, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

GEO. H. PECK, Secretary.

Office, 212 Clay street, San Francisco. no23

Sweet Vengeance Gold and Silver Mining Company, Brown's Valley, Yuba County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the thirteenth day of November, 1867, an assessment of seventy-five cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of this Company, No. 705 Sansone street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the third (3d) day of January, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the twenty-second day of January, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

F. S. SPRINO, Secretary.

Office, No. 705 Sansone street. dec7

San Francisco and Castle Dome Mining Company, Castle Dome County, Arizona Territory.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twentieth day of November, 1867, an assessment of ten cents (10c) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, A. L. Glendling, No. 330 Montgomery street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the seventh day of January, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-seventh day of January, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

A. R. SMITH, Secretary.

Office, Room No. 40 Morebanis' Exchange, California street, San Francisco. dec7

Siempra Viva Silver Mining Company, District of Zaragoza, Sinaloa, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fourth day of December, 1867, an assessment of twenty-five cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, 318 California street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the tenth (10th) day of January, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-seventh day of January, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

JOHN F. LOHSE, Secretary.

Office, 318 California street, San Francisco, Cal. dec7

Senton Mining Company.—Location of Works: Drytown Mining District, Amador County, State of California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-first day of November, 1867, an assessment of one hundred and fifty dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, No. 60 Exchange Building, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the twenty-eighth day of December, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on the eighth day of January, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

JOSEF E. LIEBOWITZ, Secretary.

Office, room No. 10, 2d floor, No. 405 Montgomery street, San Francisco, Cal. no2

POSTPONEMENT.—The day for meeting stock delinquent on the above assessment is hereby postponed until Wednesday, the first day of January, 1868, and the sale thereon until Wednesday, the twenty-second day of January, 1868. By order of the Board of Trustees.

T. W. COLBURN, Secretary. no30

Machinery.

**VARNEY'S PATENT AMALGAMATOR.**

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setters made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setters for themselves, at the **PACIFIC FOUNDRY,** 171 San Francisco.

**Hunt's Double-Action Pump**

cheap, durable, strong, and not liable to get out of order. Built and on hand at No. 23 Second street, and 103 Jessie street. 12v15tr

**PATTINSON'S**

**HURDY-GURDY WATER-WHEEL.**

The inventor of this Wheel having, after much delay, finally obtained the patent for the same, is prepared to sell rights therefor to such as may be desirous of putting them up, or continuing those already in use. This is well known among millers as the "hurdy-gurdy wheel," and is considered the most economical Water-Wheel now in use.

Notice is hereby given, that the subscriber is the inventor and holds the patent right for the construction and use of the same; and that no person has a right to manufacture or use them without his permit. 7v15-4y

**THOMAS PATTINSON.**

**Brodie's Patented Improvements**

FOR THE TREATMENT OF

**Gold and Silver Ores.**

**BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER.**

The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms:

- No. 1—Or 8-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price . . . \$600
- No. 2—Or 15-inch Crusher, capable of similarly putting through two to six tons per hour. . . . 850
- No. 3—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour. . . . 1,200

EXPLANATION OF THE ABOVE ENGRAVING. The frame is made of cast iron, bound with heavy wrought iron bands, making it very strong, and at the same time light and portable. The crusher is bolted to a wood frame of sufficient height to clear the fly-wheel, and allow the crushed quartz to pass off. The dotted lines show the movable and stationary jaws. Letter A represents the eccentric shaft by which the power is applied direct to the movable jaw. B represents the movable jaw, and C the fixed jaw. D represents the link or radius bar. E represents the bolts for regulating the opening, F, which can be regulated at pleasure, so as to graduate to the size to which it is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designated.

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, G, gives the movable jaw, B, a forward and downward motion at the same time, and which makes the hardest rock yield and separate into fragments of any desired size.

The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Rawhide Ranch, Tuolumne county, Excelsior Mine, Lake Ostrander, Nevada county, and can be seen in operation at the Fulton Foundry, First street, San Francisco.

The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Rawhide Ranch" Mine, in Tuolumne County:

**RAWHIDE RANCH, Tuolumne Co., Sept. 28, 1866.**  
JAMES BRODIE, Esq., San Francisco.—My Dear Sir: It gives me pleasure to inform you that I have for the past three months had one of your Crushers in operation at my mine in use, at the Rawhide Ranch Mining Company's Mill, which is entirely met my expectations; and I have no hesitation in recommending it to all who are in need of a machine for rapidly, cheaply and properly preparing quartz for the stamps. Yours truly,  
R. P. JOHNSON,  
Supt. Rawhide Ranch Quartz Mill.

**BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.**—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.

For the present it is not intended to grant licenses for the use of the improved German Barrel, for a longer term than twelve months. All persons desirous of compromising, without having recourse to legal proceedings, for past infringements or destruction of property, of this machine for the limited period named, are requested to address as below. A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1866.

**BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.**—This Dry Crusher has been found the most economical and effective mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1866. JAMES BRODIE, Fulton Foundry, or CHAS. B. RAOULT, Express Building, 402 Montgomery street, San Francisco.

**E. O. HUNT,**

Manufacturer of

**Windmills, Horse-Powers, Pumps, Pumping Frames and Gearing.**

HUNT'S ADJUSTABLE WIND MILLS to have all the sails arranged as turn edgewise to the wind when the mill is stopped. The sails can be set at any angle to suit the force of the wind, while the mill is running, by means of the brake lever at the foot of the mill, by any person.

HUNT'S SELF REGULATING MILL is strong, durable and cheap. It is provided with a self-regulating top, in the most violent winds, this mill is well known throughout the State.

Tread Horse-Powers, Saw-Power Horse-Powers, Pumps in great variety, Single and Double-acting. Frames and Gearing for running pumps, from steam or other power, constantly on hand and built to order. Water Tanks built to order. No. 28 Second St., and 103 and 110 Jessie St. 2v15y3

**DR. BEERS' PATENT WIRE GAUZE AMALGAMATOR.**

THE ATTENTION OF QUARTZ, HYDRAULIC AND Placer Miners, is called to this new invention for saving Fine Gold. It is designed for forcing the miner with a cheap and simple apparatus by which the finest free gold can be saved without loss, requiring little attention, no machinery to drive it, and will positively collect every particle of amalgam, or of waste mercury that may have escaped from mill or sluice, and as these particles are always charged with more or less gold, this item alone, in many instances, will more than pay the cost of this Amalgamator every month. For Circulars, and further particulars, address  
Dr. J. B. BEERS, San Francisco, 1v15 6m  
Per Wells, Fargo & Co's Express.

**Mining in Sierra County.**

ALLEGHANY.—Quartz in this vicinity is looking up remarkably, and making times comparatively lively. There are a large number of fine looking veins that evidently would pay well, with sufficient capital to properly develop and work them. The Union mine has been very rich, and would probably continue to pay, were it not for some disagreement among the present owners. As it is, work has been stopped for some time, and the property remains idle, waiting for a settlement of difficulties. The Oak Flat ledge has the appearance of being the best developed lead in the vicinity. It is owned by Dnnkin & Co., who have really got a large and clearly defined vein of ore, well opened for inspection. Parties wishing to purchase a good vein of low grade ore, would do well to pay this mine a visit.

**A VALUABLE DISCOVERY.**

There are several other leads that promise well, and apparently only want a little means, properly applied, to prove them valuable. But what has caused considerable excitement, and apparently given a new impetus to quartz enterprise generally hereabouts, is the mining discovery, made about a year ago by Messrs. Fessler, Lewis and two others—styled the Docile Co. This most remarkable and peculiar ledge of gold hearing rock is located about one and a half miles from town, on the South Fork of Kanaka Creek by the above named parties, who, mining in the creek, took out very good pay until they arrived at a certain point, when their pay gave out, and they then left the creek and commenced prospecting the bank immediately opposite where the pay had ceased; here, to their astonishment, they found the top dirt even richer than it had been in the creek, and in a very short time they were rewarded by finding the vein from whence the precious metal had emanated. This vein, at the point of discovery, shows no quartz whatever, but instead, a very large strata of talcose slate, and soap stone, partially decomposed, and workable in a rocker from which they averaged \$15 to the man, until more recently they have traced their lead up the bank or divide, where at the distance of 300 feet from the point of discovery, the vein merges into a large ledge of quartz. From this point they trace it up the mountain some 200 feet, where, running a cross-cut, they find the lode to be forty feet in width, of good pay ore. From hence a further trace is made to a distance of 800 feet from the point of discovery, where an incline is sunk to the depth of thirty feet. From this incline the company have panned out of decomposed sulphures, and pounded out in a hand mortar, \$20,000 of gold, worth \$19 per ounce, besides a pile of ore yet to be crushed (when a mill is erected), and which is estimated to yield \$10,000 more—making \$30,000 taken from a thirty foot incline. Mr. Frank Smith, of North San Juan, and Harry Sears, of San Francisco, have purchased one-fourth interest of this claim, for which they are to erect a 10-stamp mill. Mr. Smith has also since purchased another one-fourth interest (250 feet) on his own account, for \$15,000.

Messrs. Bovee & Co. have a claim on the same ledge, commencing just above the Docile Co's incline, and extending up the mountain 1,000 feet, which is supposed to be equally as rich as the Docile, from the fact that the latter company found their richest pay nearly at the division stake. They will commence work next season. This lead can be worked as cheap or cheaper than any other known mine in the State—as their rock requires no blasting, and timber and water abounds plentifully close at hand. It is estimated that mining and milling will not cost to exceed \$1.50 per ton. The Johnson Co., near by, have also found excellent rock from which they make wages in a hand mortar.

FOREST CITY.—Some few claims in this place are still washing out handsome dividends, the most prominent of which are the Live Yankee and Young America.

BRUSH CREEK, four miles below Forest City now, affords a mine unsurpassed for richness by any in the State. It is styled the Brush Creek mine, and is owned by N. A. Watson, of Camptonville, and S. F. Lord, of San Francisco. They have a shaft over 250 feet deep, with from four to six foot vein, yielding tons of ore sufficiently rich for jewel settings, much of it being apparently half gold. Mr. Watson has owned

this mine for a long while; it once closed up on him—pinched entirely out; but observing that the casings continued in the form of a seam, he followed down until the quartz again appeared more abundant and richer than ever. It is now conceded by good judges to be a first class vein. Mr. W. has only hoisting and pumping machinery at present, but will erect, during the coming season, a 20-stamp mill. Success to his efforts.

GOODYEARS' BAR still exists in the geography of Sierra. From this point to Downieville, and far above on the Yuba, considerable mining is being done; to what extent cannot be known, as it is principally in the hands of Celestials.

DOWNEVILLE.—This place, owing to its being the outlet of a vast scope of mining country, presents a comparatively lively appearance. Quartz is beginning to attract considerable attention, although as yet but little is done except to make a start in the matter. There are some twelve or fifteen veins in the immediate vicinity, sufficiently prospected to establish a value, some of which afford high expectations to their owners. The Gold Bluff ledge (Stumph & Co., proprietors), situated one and a half miles above town, is a well defined vein from four to seven feet in width, paying from \$18 to \$22 per ton. The company have a tunnel in 1,050 feet, and expect to strike the ledge inside of an additional 100 feet, some time during the coming winter, when they will tap the vein at least 700 feet below the surface. As soon as this is done, they will start their 12-stamp mill situated on the vein about 200 yards below the mouth of the tunnel. The Good Hope (Dr. Jump, McKinsey and others, proprietors), one mile from town, and finely located for working by means of tunnel, is a clearly defined three foot vein of decomposed gold bearing quartz, all of which prospects well, and from several mill tests, yields \$21 per ton. They are down 100 feet, finding gradual improvement in both quantity and quality as they go down. Intend running a tunnel this winter to strike the ledge 300 feet below the surface. More next week. B.

INDIA RUBBER which is ordinarily cut with so much difficulty by a knife, may be quite readily severed if the operation is performed under water.

A LATE Boston notion is to generate steam with the aid of waste coal dust, very fine, injected by a current of compressed air into the space over the fire, where it is said to burn with an intensely hot flame, greatly increasing the production of steam.

A. T. DEWEY. C. W. M. SMITH. W. B. EWER. THE BEST IN AMERICA.

The Mining and Scientific Press, is the Largest and Best MINING AND MECHANICAL Newspaper issued in the United States.

DEWEY & CO., Patent Agents, Publishers, Book and Job Printers, 505 Clay Street, San Francisco.

THE MINING AND SCIENTIFIC PRESS is published every Saturday. Each issue comprises sixteen pages (64 columns), and furnishes more valuable reading matter than any other weekly journal in California.

To the practical mechanic, metallurgist, prospector, millman, mine holder or worker, it is worth many times its subscription price. Its files contain a record of the improvements in mining machinery, the progress and development of the mines, and all new methods and processes for working and

SAVING PRECIOUS METALS, All progressive information, in fact, transpiring with the times—which cannot be obtained from books.

The Mining and Scientific Press is now in its FIFTY-SEVENTH VOLUME, and enjoys a large circulation. It received the following hearty endorsement of the California Miners' State Convention, held at Sacramento, January 17th, 1886:

RESOLVED, That we regard a mining paper or journal of great importance to the mining interests of California, and recommend the Mining and Scientific Press, of San Francisco, to the consideration and support of the miners of the Pacific coast.

Terms of Subscription.—One year, \$5; six months, \$3—in advance. Send for sample copies. Remittances may be made by mail at our risk, if parties sending will register their letters, or send money order.

AS AN ADVERTISING MEDIUM throughout the whole Pacific States and Territories, the Press is unsurpassed. Rates moderate.

SPECIMEN NUMBERS of the Press and Patent Circulars, sent free. DEWEY & CO., San Francisco.

July 1st, 1887. Mining Secretary.

THE SUBSCRIBER, HAVING SERVED FOR THE LAST five years as Secretary of various mining companies, feels fully competent to serve in that capacity. Any parties wishing to secure the services of a Secretary can be accommodated on reasonable terms. Information given, and all necessary papers correctly made out. Having had a long experience in the purchasing of goods and machinery for miners, parties in the mines will find it to their advantage, when purchasing goods are employed, to send their orders to the undersigned.

Economy in Advertising.—THE MINING AND SCIENTIFIC PRESS is the best and most economical mining advertising medium in this city. Our terms are less than one HALF the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The Press contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

HAYWARD & COLEMAN, IMPORTERS AND REFINERS OF ILLUMINATING, LUBRICATING, PAINT OILS! CONSISTING OF KEROSENE, LARD, SPERM, ELEPHANT, POLAR, TANNERS', NEATSFOOT, BOILED AND RAW LINSEED, CASTOR AND CHINA NUT.

SPIRITS OF TURPENTINE & ALCOHOL. Note.—We would specially call the attention of MILL OWNERS and ENGINEERS to our superior PARAFFINE OIL, which we manufacture from the California Petroleum. This Oil will not gum. Machinery thoroughly cleaned and lubricated with it will not heat, and after remaining at rest, can be started without cleaning out. A sample can of our Paraffine Oil will be forwarded on application to us, as we desire a fair and impartial trial. Lamps and Lamp Stock! An elegant and complete assortment on hand. 19v13-3m 414 Front street, San Francisco.

NEW YORK PRICES. WATCH REPAIRING AT NEW YORK PRICES. C. E. COLLINS, No. 608 Montgomery street, San Francisco. EXCLUSIVE AGENT FOR THE AMERICAN WATCH FACTORY. A large assortment of these Superior Watches, in Gold and Silver Cases, Constantly on hand, and sold at Factory prices. Also, ENGLISH AND SWISS WATCHES, Imported directly from the Manufacturers. The American Company are now making VERY FINE WATCHES FOR LAOIES. A large assortment of Gold Chains and Jewelry. 12v10-5m

WE ARE NOW OFFERING OUR IMMENSE STOCK

Fine Custom Made Clothing Gents' Furnishing Goods AT PRICES THAT DEFY COMPETITION. Our Stock of Clothing Consists of ALL THE LATEST STYLES BOTH OF MATERIAL AND FINISH.

A Large Assortment of Trunks, Valises, Carpet Bags, Blankets, Etc., AT EXTREMELY LOW PRICES. J. R. MEAD & CO., 8v10 Cor. of Washington and Sansome streets

Pacific Powder Mills. SUPERIOR BLASTING AND SPORTING POWDER: Black Diamond, in 1 lb canisters. do do in 2 1/2 lb canisters. do do in 5 kegs. Hunter's Pride, in 1 lb canisters. do do in 2 1/2 lb canisters. do do in 5 kegs. Pacific Mills River Shooting, in 1 lb canisters. do do in 2 1/2 lb canisters. do do in 5 kegs. Pacific Mills Rifle, in 1 lb canisters. do do in 2 1/2 lb canisters. do do in 5 kegs. Blasting and Mining Powder \$2 60 per keg. Safety Fuse and Shot for sale by HAYWARD & COLEMAN, Agents, 24v15-3m 414 Front street, San Francisco.

To Foundrymen and Blacksmiths.

LUMP LEHIGH AND CUMBERLAND COAL IN ANY quantity, sacked and shipped to any part of the country, by JAS. R. D'YLE, Coal Dealer, 413 and 415 Pacific street, bet. Sansome and Montgomery, San Francisco. 24v15-3m

Manzanita Pipes!

WHOLESALE AND RETAIL.—SALESROOM, NO. 53 Third street, near Mission; Factory, No. 10 Stevenson street, near First San Francisco. These Pipes are manufactured from the best Mountain Manzanita, as sweet as Meerschaum. 24v15-3m JACKSON & SPAULDING.

Machinery. NOTICE TO MERCHANTS AND MANUFACTURERS. Moore's Patent Friction Hoist. Now in successful operation in the principal stores in San Francisco, possesses many advantages over the common Hoist—viz: Greater strength; less danger in working, as goods require no slinging or landing, consequently make fewer breakages; requires one man less to operate it; stops with the load at any point, without any fastening or attention from the operator. The undersigned take this opportunity to notify all whom it may concern that they have secured, by letters patent, the application of a friction pawl, or stop, to hoisting machines, and that they will prosecute any party making or using any machine infringing upon the same. VULCAN IRON WORKS CO., By Joseph Moore, President. JOSEPH MOORE.

BLAKE'S PATENT QUARTZ CRUSHER. CAUTION! The owners of the Patent for this valuable machine, in order to facilitate the protection of their rights against numerous infringers, procured, some time since, a reissue of the Patent, bearing date January 9th, 1866.

This Patent secures the exclusive right to employ in Stone-Breaking Machines Up-right Convergent Jaws, actuated by a Revolving Shaft. All persons who are violating the Patent by the unauthorized making, selling or using machines in which quartz other material is crushed between upright convergent jaws, actuated by a revolving shaft, are hereby warned that they are appropriating the property of others, and they will be held responsible in law and in damages.

Noticé to Miners, Well-Borers and Water Companies. M. PRAG IS NOW PREPARED TO MANUFACTURE Hydraulic and Artesian Well Pipes in the best workmanlike manner, and at the lowest market rates. Having made large additions to my stock of machinery for that branch of business, I am prepared to fill all orders with dispatch, and guarantee entire satisfaction. I also manufacture Mississippi Stoves, of the latest improved pattern, for vessels of all classes. Also, Ship Plumbing done. M. PRAG, 8v13-1y Stove Store, No. 125 Clay street, below Davis.

A FULL ASSORTMENT OF MOLDERS' TOOLS, Constantly on hand and for sale at low prices, by CHAS. OTTO & CO., Successors to Marwedel & Otto, 312 Bush st., a few doors above Montgomery, San Francisco. 22v15-3m

A FULL ASSORTMENT OF MACHINE SCREWS AND TAPS, Constantly on hand and for sale by CHAS OTTO & CO., 22v15-3m 312 Bush street, San Francisco.

A FULL ASSORTMENT OF TWIST DRILLS, At low prices, being sole Agents for the manufacturers, (the Manhattan Firearms Company). ALSO—Steam Gauges, a general assortment of Hardware, Cutlery, and MECHANICS' TOOLS, By CHAS. OTTO & CO., 22v15-3m 312 Bush street, San Francisco.

ELLERY'S Patent India Rubber Paint and Cement. Is composed of India-rubber and other gums, dissolved in pure linseed oil, mixed with the various coloring matters, and ground in any color. We paint Wood, Brick, Metal, Cloth, etc. It is a superior Marine Paint. Will not rot, peel, blister or crack in any climate. Fifteen hundred Fish Vessels at Gloucester, Mass. use it as superior to other paints. We refer to Steamers America, Senator, Paul Pry, Julia, etc., and W. K. Van Allen, S. C. Bugbee & Son, Tubbs & Co., C. W. Thomas, Sidney Johnson, Dr. Heuston, Genl Connor, Stockton, H. L. Davis, Jas. Lick, J. P. Pierce, Esqs., and others. Filbert Street School House, two coats on redwood, equal to three coats lead. One hundred pounds paint equal in bulk to two hundred pounds lead. Cementing and painting new or old Tin or Metal Roofs. We first cement around fire walls and skylights all holes and cracks, then apply a good coat of paint. A good clean, tight roof is certain. Price, from one to three cents per square foot, according to size and condition of roof. New Cloth Roofs put on, saturated with liquid rubber; then painted at nine cents per square foot. We use none but the best materials and pure linseed oil. No lead turpentine, neither asphaltum or coal tar. Also, for sale, "Submarine Rubber Varnish," \$5 per gallon; any color. We will apply to Vessels' Bottoms, or furnish at \$6 per gallon. 23v151f

It is a Fact, That BOWMAN'S AMERICAN WASHING COMPOUND is the best article for Washing and Cleaning yet discovered. It is acknowledged to be a saving both in money and labor. As the Compound softens the dirt, the clothes require not more than one-half the rubbing necessary in washing by the old method; besides all who give it a trial acknowledge that their clothes are whiter in washing with this Compound than they were ever known to be by using any other preparation. For washing woolen goods and flannels, it cannot be equalled. Calicoes that cannot be washed with soap without fading are washed in the water used for boiling white clothes. This Compound has been used in the Eastern States for the past three years, with perfect success. WARRANTED NOT TO INJURE THE CLOTHES. For sale by all Grocers. J. W. & P. PARSONS, Agents, 14v15-3m 223 Jackson street, near Battery.

New Patents and Inventions.

Under this heading we shall mention, from week to week as occasion may demand New and Important Inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent Issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

PATENTS RECENTLY ISSUED.

70,628.—ADJUSTABLE PROP-JOINTS FOR CARRIAGES.—Anson Searle, San Francisco, Cal.:

I claim, 1st, An adjustable or extension prop-joint.

2d, A socket, pivoted, or center joint, all substantially as described, and for the purposes set forth.

70,763.—FAN-BLOWERS.—Warren P. Miller, of San Francisco, Cal.:

I claim the blower, consisting of two or more wheels, constructed and operated in manner as described.

70,781.—SEEDING MACHINES.—Robert Baxter, of French Camp, Cal.:

I claim, 1st, The seed-hox, constructed as described, and provided with a rod and prongs, so located that a part of the several prongs only are in the box, and that at the front side thereof, as and for the purpose described.

2d, The elbow-lever, operated by a pin on the plow-wheel, and operating the rod with its prongs, in combination with said rod, in the manner and for the object set forth.

70,804.—LEVELING ATTACHMENT TO AGRICULTURAL IMPLEMENTS MOUNTED ON WHEELS.—Benjamin F. Cook, of Olema, Cal.:

I claim the application of a wheel, F, provided with a rim, a, beveled so as to form inclined planes, and interposed between the rear axle and bolster of the machine, substantially as and for the purpose set forth.

I also claim the combination of the wheel, F, and the capstan or winch, H, substantially as and for the purpose specified.

I further claim the rake, e, arranged in relation with the drum d of the capstan or winch, H, and connected to the lever, Gx, when said parts are used in combination with the wheel, F, for the purpose set forth.

70,839.—AMALGAMATOR.—Fred. G. Hesse, of San Francisco, Cal.:

I claim, 1st, The narrow annular amalgamating-chamber, A, formed by a revolving cylinder, D, and an inner cylinder, either stationary or revolving with D, constructed for very high speed, and in combination with a hydraulic device to cause a current of water to pass through said chamber, for the purpose substantially as described.

2d, The use of an extra current within the chamber, A, for the purpose of discharging pulp without interfering with the amalgamating current, substantially as described.

4d, The manner of producing this current by means of a centrifugal head and guide-blades, substantially as described.

70,914.—GOLD SEPARATOR.—William C. Stiles, of Nevada City, Cal.:

I claim, 1st, The arrangement of the openings, o, o, protected by screens, s, s, and ledges, l, l, upon an inclined vibrating table, T, having a series of transverse ledges, l, l, for the purpose of separating the gold dust from dirt, substantially in the manner described.

2d, The combination and arrangement of a series of foraminated water troughs, w, w, with an inclined vibrating table, T, having openings, o, o, and ledges, l, l, substantially as and for the purpose set forth.

70,959.—IMPROVEMENT IN CHURNS.—Chas. Colby, San Francisco, Cal., assignor to himself and Michael O'Neil, of same place.

I claim the combination and arrangement of the driving-shaft, B, gears, C and E, with gears, D and F, at the opposite end of the churn, with the dashers, H and K, and barrel L, all as described for the purpose set forth.

This invention consists in providing a more efficacious method of dividing and agitating the particles of cream by a system of rotary dashes or arms operating in contrary directions, the one within the other. This is done by constructing a churn with a circular barrel having a shaft passing longitudinally through its center, at one end of which is a pinion operated by a gear-wheel on the driving-shaft. This central axis carries a set of arms or dashers. Another set of dashers is carried in a contrary direction by a gear and pinion at the other end, their supporting arms being so long that they revolve outside the first mentioned dashers.

CHALLENGE FOR TWO THOUSAND DOLLARS,

—AND THE—

"GOLD MEDAL."

THE EXCELSIOR PUMP COMPANY

Hereby challenge Mr. THOMAS HANSBROW in the above amount, to a Mechanical Trial between his "Challenge Pump" and the "Excelsior Pump," the trial to take place in San Francisco, before a

COMMITTEE OF MECHANICS,

Each Pump to be constructed in accordance with its patent, and to be tested from their least to their greatest capacity, together with the power required by each Pump. A meeting for settling arrangements for the trial may be had at the office of the MINING AND SCIENTIFIC PRESS. This Challenge open for sixty days.

The "Excelsior Pump"

Was NOT entered for the GOLD MEDAL, at the recent State Fair, as it was verbally agreed, by Mr. Hansbrow and Mr. Hooker, that they would not enter their Pumps for the Medal, as no means were provided for testing machinery, and believing that

Policy, not Merit of Machines,

Was to govern the award of prizes. The inference is clear—hence the above Challenge.

CUSHING & HOOKER, Prop'rs.

23v151c

71,011.—IMPROVEMENT IN AMALGAMATORS. Alfred Horn, Silver City, Nev.:

I claim, 1st, The application of a scraper or distributor, C, to an amalgamating machine or pan, for the purpose of distributing the mercury through the pulp, substantially as described.

2d, Arranging the said distributor to an amalgamating machine, so that it may be easily adjusted to the wear of the shoes and dies, substantially as described.

The nature of this improvement is to provide means for constantly enlivening the mercury employed for amalgamating the precious metals, and consists of a scraper or distributor, having an arm attached to it, the end of the scraper operating in a groove, in which the quicksilver is placed around the bottom of the pan, the whole being attached to the muller-frame to be carried around with it. In most amalgamating pans, says the inventor, there is a space between the inner end of the mullers and the cone that is recessed for the purpose of holding mercury, and which large body of mercury has no means whereby it may be distributed in the pulp, except by the friction of the pulp or ore passing over its surface; and in many instances the surface of the mercury becomes covered with a film or coating, which render it wholly inactive and ineffective for taking up the precious metals, the friction of the pulp being insufficient for removing the scum or coating.

71,056.—IMPROVED ROCK DRILLING MACHINE.—Walter Pierce, Union Valley, Cal.:

1st, I claim the adjustable ways, C, having the drill, D, and the slotted hammer, F, moving upon them, substantially as and for the purpose described.

2d, The levers, J, I, and G, operating upon each other, and upon the hammer, F, substantially as and for the purpose described.

3d, I claim in connection, as an improved drilling machine, the levers, J, I, and G, the hammer, F, operating upon the drill, D, together with the adjustable ways, C, C, the whole constructed substantially as and for the purpose described.

The object of this invention is to provide an improved horizontal drilling machine, which can be operated in tunnels, or in any place where it is difficult to swing a sledge, and with greatly increased power and efficiency, the direction of the drill being determined by the angle of the ways in which it and the hammer move. The hammer is moved backward and forward by a lever or system of levers so arranged as to be worked with the greatest facility.

71,085.—WRITING APPARATUS FOR THE BLIND.—John Synnot, San Francisco, Cal.:

I claim, 1st, The tablet with pins, b, b, and the hinged frame, B, with notches or slots, a, a, substantially as described.

2d, The bars, E, F, and the measuring block, H, with the pin, I, together with the following-block, G, with its projections, c, and lug, d, substantially as described.

The nature of the invention is to provide a machine, such as will enable that class of persons who have become prematurely blind or near-sighted to write letters and direct them, as well as to perform any correspondence or manuscript writing. In order to accomplish this object, the inventor employs an inclined tablet or desk, having an inclined drawer for stationery. On this tablet is placed a hinged frame, upon the sides of which are placed slots, about one-half of an inch apart, in which are placed two rods or bars, the upper one of which acts as a guide to obtain the width of the line, and is curved at both ends. Upon the lower bar or rod are placed two blocks, one of which fits closely upon it, and is for the purpose of a measure; the other one acts as a guide, and moves easily along the bar. Pins are placed in one corner of the tablet for the purpose of a guide to the sheet of paper and envelope.

REISSUES.

FUSIBLE DISKS FOR STEAM BOILERS.—William Burnett, of San Francisco, and John Absterdam, of New York city, having petitioned for the extension of a patent granted to them the 28th day of February, 1854, for an improvement in the use of fusible disks in steam boilers, for seven years from the expiration of said patent, which takes place on the 28th day of February, 1868, it is ordered that the said petition be heard at the Patent Office on Monday, the 10th day of February next.

GANG PLOW.—William B. Ready, of Sacramento, Cal., has petitioned for an extension of a patent granted to him Dec. 3d, 1861. The claims for the same are as follows: I claim, 1st, The curved beams, A, when used in connection with a gang plow, or a series of plows connected together by cross-bars, B, B, constructed and operating as and for the purposes herein set forth.

2d, The arrangement of the arms, G, wheels, I, and lever, J, when attached to the right-hand arms, G, and connected to the central beam, A, as and for the purpose set forth.

3d, The arrangement and application of the draught at any point or place below the top of the standard of the plow, as specified and described and for the purposes set forth.

CHICKERING & SONS'

PIANOS

Received the FIRST PREMIUM (Gold Medal)

And Decoration of Legion of Honor, at the Paris Exposition.

KOHLER, CHASE & CO., Agents,

26v14n16p

421 Montgomery street, San Francisco.

W. T. GARRATT, City BRASS AND BELL FOUNDER.

Cor. Mission and Fremont sts., SAN FRANCISCO. Manufacturer of Brass, Zinc, and Anti-Friction or Babbet Metal Castings; CHURCH AND STEAMBOAT BELLS,

TAVERN AND HAND BELLS AND GONGS, FIRE ENGINES, FORCE AND LIFT PUMPS,

Steam, Liquor, Soda Oil, Water and Flange Cocks, and Valves of all descriptions, made and repaired. Hose and all other Joints, Spelter, Solder, and Copper Rivets, &c. Oauge Cocks, Cylinder Cocks, Oil Globes, Steam Whistles,

HYDRAULIC PIPES AND NOZZELS For Mining purposes, Iron Steam Pipe furnished with Fittings, &c. Coupling Joints of all sizes. Particular attention paid to Distillery Work. Manufacturer of "Garratt's Patent Improved Journal Metal."

Highest Market price paid for OLD BELLS, COPPER AND BRASS. 67

SIXTH INDUSTRIAL EXHIBITION

UNDER THE AUSPICES OF THE

MECHANICS' INSTITUTE, SAN FRANCISCO.

The undersigned, acting under authority from the Mechanics' Institute of the City of San Francisco, take pleasure in announcing to the public that they have resolved upon holding an Industrial Exhibition in the month of August, 1868, on a much larger scale than was ever before attempted on this coast; and they make this early announcement of their intention, that all who may desire to participate shall have ample time for preparation.

A programme, embracing rules and regulations for the government of participants, with list of Premiums to be awarded, etc., is receiving such earnest and careful attention as the importance of the enterprise demands and in due season the same will be made public by circulars widely distributed, and by advertisements in the leading journals of this coast.

Executive Committee:

## Close of the Year.

With this number we close the year 1867. The year's list of the distinguished dead, so far as their names have reached us, is recorded in another column; but as we have not yet quite reached the point where the "down grade" commences, the sad tidings of the departure of others may yet come in. But these constitute a mere moiety of the mighty procession which has crossed the dark river during the year just drawing to a close. More than thirty millions of human beings have gone down into the shoreless ocean since last wo, who are left, exchanged New Year's greetings! What a terrible "dead march" is that of this mournful column,—moving along,—tramp, tramp,—on its way to the silent shades of "the evermore!"

Men fall everywhere. From the throne, from classic shades, from the lofty seats of science, from the pulpit and from the forum,—they fall;—high or low, at home and abroad, they die. In how many home circles are missed to-day some who so happily commenced the year with us! The absence of father, mother, brother, sister,—some dear little child, or some favorite friend,—brings heartfelt sorrow to thousands. The quick tear starts to the eye as the vacant seat at the festive board is noted; and those who remain instinctively draw together in closer communion, as if to close the gap.

All things material bear the legend, "Passing away." Even the solid earth will, in its turn, cease to be. Not Revelation only, but Science, has thus declared. Its elements will recombine in changed forms, as will those which constitute the material part of man. Does nothing, then, remain unchanged? Yes! that which has had a single glimpse at the Infinite; that which has had, for one instant, a conception, however vague, of something beyond itself; that which feels within itself a dependence upon a personal Deity! This consciousness of Infinity, is itself infinity. What some men call Nature, and recognize as the only God, will die; and as man, when dead, is laid in the grave by those who remain, Nature herself will, in her turn, be buried and forgotten, so to speak, by the Eternal and his angels.

**MINING AND SCIENTIFIC PRESS PATENT AGENCY.**—Twelve patents were issued to inventors in this State from the U. S. Patent Office at Washington, for the week ending Nov. 19th. Of this number ten were obtained through the **MINING AND SCIENTIFIC PRESS PATENT AGENCY.** Inventors on this coast appear to have a due appreciation of the advantages of obtaining their patents through us. Having a regular established agency at Washington, where personal attention is given to every application through this office, gives us a most important advantage in securing an early, and the fullest and most favorable attention to our business. Inventors will always find it to their advantage to transact their business through a well established and responsible firm, whose interests are permanently and closely identified with the prosperity of this coast, to say nothing of the advantages of having their inventions fully set before the public through the columns of the **MINING AND SCIENTIFIC PRESS.**

## An Improved Compressed Air Hammer.

The invention herewith illustrated exhibits another form of the Compressed Air Hammer, illustrated and described in our issue of October 5th, 1867. The object of hammers of this description are to obtain a great range of force, coupled with any required rapidity of blows, so as to be suitable

for the blows beyond the speed of revolution of the driving-pulley.

An efficient hammer worked by compressed air is found very advantageous in many situations, such as where there would be a material loss of power by condensation in bringing steam from a great distance. It also meets the cases where water-power or other power than steam is alone available;

in the valve-chest, by which the air is drawn into the reservoir by inlet-valves, and there retained by suitable delivery-valves. The pressure of the compressed air is regulated by the safety-valve, E. F is the hammer-rod and piston; the air is admitted above and below the piston alternately by the valve, G, at the top of the cylinder, and escapes by an exhaust port at one side of the cylinder. The pressure of the air admitted from the reservoir, D, is regulated by the throttle-valve, I, worked by the foot-treadle, K. The slide-valve, G, is worked by a crank-pin on the horizontal disk, M, and this is driven by contact with the vertical wheel, N, on the shaft of the driving-pulley, B. The disk, M, is pressed down by a spiral spring on the lower end of its spindle, and the wheel, N, slides along the driving-shaft on a feather, and is shifted by a lever, P, varying the speed of driving the disk, M, by acting upon it at different distances from its center, and thereby giving a range of speed for driving the slide-valve up to more than double the rate of the revolution of the main driving-pulley, B. By means of the lever, P, the number of blows of the hammer can be changed without stopping from one hundred and fifty to four hundred and twenty per minute, with a working speed of the driving-wheel of one hundred and fifty to two hundred revolutions per minute. The valve-spindle is connected with the crank-pin on the driving disk, M, by a connecting-rod, which can be disconnected at pleasure, and the slide-valve can then be worked by hand or foot by means of the lever, T, when the hammer is required to be used for stamping. L, L are two screws, which pass through the side of the valve-box and serve to hold the cut-off slides stationary in any desired position. The force of the blow is regulated by shifting the safety-valve weight, E, or by means of the throttle-valve, I, altering the pressure of air upon the top of the hammer-piston, and the slide-valve motion admits of altering the rapidity of the blow instantaneously, giving also the means of obtaining a very high speed without involving any destructive tappet-motion as the small slide-valve, G, is alone required to be worked at the high speed; by the use of the hand or foot lever, T, the hammer is readily and conveniently worked as a simple stamp. When the hammer is at rest, the pump and air chamber may be employed as a blast or blower for the furnace with considerable advantage and economy.

GRIMSHAW'S PATENT IMPROVED COMPRESSED-AIR HAMMER.

for any description of forging, light or heavy, for tilting or for planishing. These machines are also capable of being worked by hand, with heavy blows, for stamping.

The machine herewith illustrated consists of a force-pump, supplying compressed air to a reservoir, and a working cylinder and piston with hammer similar to those of a steam-hammer, but worked with compressed air instead of steam, and having arrangements for varying the action of the hammer as required, and increasing the rapidity of

and has an advantage in being always ready for work, not having any accumulation of condensed water in the cylinder and passages as in the steam-hammer. It also possesses many other advantages which we have no space to enumerate.

In the illustration, the double-acting air-pump, A, is worked by a crank-pin on the driving-wheel, B. The interior of the hammer-frame, D, is hollow and air-tight, and forms a reservoir into which the compressed air is delivered by the pump. C is a port

This hammer is the invention of Wm. D. Grimshaw, of Birmingham, England, an illustrated description of which first appeared in the United States in the *American Artisan* of January 30th, 1867. The United States patent is owned by Thomas Prosser & Son, of No. 15 Gold street, New York, who manufacture the hammers, and on whose premises one may be seen in operation.

The amount paid for Russian America is about 2½ cents for each acre contained in the ceded territory.

## Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all practical subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

### The Freiberg, or Barrel Process, for the Reduction of Gold and Silver Ores.

BY PROF. ROWLANDSON, F. G. S. L.

NUMBER SIX.

#### THE CHLORINE AND BRINE MODE.

An article by Dr. Lanzweert, which appeared in the *MINING PRESS* of the 14th instant, has induced me to return to this subject at greater length than I originally intended when commencing this series. In the first place, I wish to observe that it was my intention to confine my observations, in a great measure, to actual working trials, not to mere experiments, such as those quoted by Dr. L. appear to be, as I shall show hereafter.

In order to arrive at a proper understanding in relation to this process, it is requisite to become acquainted with the respective properties of chlorine as a solvent of gold, and a solution of common salt as a solvent of chloride of silver, before a rational conclusion can be arrived at, whether the process now under investigation is the most economical, or otherwise, for the reduction of any particular variety of ores containing an admixture of the above-named metals.

As Dr. L. states that "he is not aware as to the amount of chlorine gas capable of being held in a *hot solution* of common salt," I will endeavor to supply the necessary information of which he states that he is deficient, and respecting which it cannot therefore be expected that chemically uneducated men could be better informed.

Chlorine, at ordinary temperatures and barometrical pressures, is a greenish-yellow gas, having a specific gravity, as compared with atmospheric air, of 2.470, so that 100 cubic inches will weigh within a minute fraction of 77 grains. This high specific gravity forms one of its most useful properties in obtaining gold from its ores, as it is easily applied by displacement. At the temperature of 60° water holds in solution twice its volume of chlorine. At the freezing point it can be further condensed, in combination with water, into crystals—the hydrate of chlorine—composed of one atom of chlorine (28.23 per cent.) added to ten atoms of water (71.77 per cent.). There are other interesting properties associated with this compound as well as the one which will be next noticed, which in the hands of a skilled expert could, not unfrequently, be economically taken advantage of in a cold country, or one possessing great diurnal as well as seasonal alterations of temperature like the State of Nevada, to particularize which, however, would require more space and time to describe than can at present be afforded.

Chlorine water, or aqueous solution of chlorine, may be formed by saturating water at 60° with chlorine gas, which gas at this temperature, becomes absorbed by pure water to the extent of double its volume. The mixture will freeze at 32°, when the compound will resolve itself into crystals of hydrate of chlorine and ice, the latter being free from chlorine. The crystals so formed, however, gradually decompose into aqueous hydro-chloric (muriatic) acid, and oxygen, particularly, if exposed to light.\* The maximum absorption of chlorine by water takes place at a temperature of about 48° from which, up to the boiling point (212°), this absorption property gradually diminishes as the temperature increases, so that when boiling heat is reached it may be regarded as nil. In a saturated solution of common salt the absorption of chlorine is slightly more than one-third less than what takes place when pure water is employed; a saturated solution of common salt, therefore, in place of absorbing 154 grains of chlorine in

every 100 cubic inches of liquid, will only absorb 103 grains, on which scale are based many of the succeeding calculations.

The temperature of lixiviation assigned by Rivot\* when a solution of common salt is employed as the solvent for extracting chloride of silver is stated to be 131°, at which temperature a solution of common salt, such as is ordinarily employed, would be capable of holding in solution, even at that temperature (131°), a volume of chlorine equal to that of the space occupied by the leaching liquid.

With a ton of prepared ore this could not amount in any case to less than 1,000 lbs. of such saturated solution, or 16 cubic feet, which, at 1,330 grains of chlorine for each cubic foot of liquid, would amount to 21,280 grains in 16 cubic feet (1,000 lbs). The combining properties of chlorine is 35.4, that of gold, 199; as, however, the ordinary chloride of gold is a ternary compound, the former figures have to be multiplied by three, by which it will be seen that 44.33 troy ounces (21,280 grains) chlorine will combine with and render soluble 83.66 troy ounces of gold, which, as fine gold, may be estimated as worth \$20 per ounce, or a sum total of \$1,773.20. From the statement just made, it is quite apparent that at a temperature of 131°, a solution will be hot enough to scald Dr. Lanzweert's fingers or feet, if he should ever attempt their immersion in such a calorific bath; and chlorine will be present at this temperature sufficient to abstract in solution more than \$1,500 worth of gold per ton even when employing a minimum of solution to cover the ore. Such an ore would not be placed in the category of poor ores, at all events at the present day, whatever it might have been considered in the wild insane excitement of 1859-60. In conclusion, it may be observed that a *hot solution* does not necessarily mean "boiling hot."

The Solubility of Chloride of Silver in Solutions of Common Salt will be considered next week.

\* Which will hereafter be quoted more at length.

[Written for the Mining and Scientific Press.]

### Mining in Sierra County.

[Continued from page 393.]

#### AN EXTENSIVE MINING CLAIM.

The Downieville Buttes, thirteen miles up the river from Downieville, are located and are now being worked successfully. There are several leads here that will rank as first class. First and foremost, is the "Reis" mine, owned by the Reis Bros., proprietors of the Cosmopolitan Hotel of this city, and superintended by F. Reis. Unlike ninety-nine out of a hundred, this mine has paid from its earliest history—having never made a "clean up" without declaring a dividend. This mine embraces three ledges, varying in width from six to twenty feet, all merging into one main trunk near or within 300 feet of the head or upper end of the Reis claim. At the junction of the three veins, is an immense chimney from twenty to forty feet in width—all pay rock. Chimneys also exist and are being worked, in either of the branch veins below. The mine is thoroughly opened by a series of tunnels showing from one to two years' supply of rock ahead. The ore is let down the face of the mountain by car and double track—the loaded car hauling up the empty one. The ore averages fourteen dollars per ton, saves easily, using no process except copper plate. There are two mills placed a short distance below the lower tunnel, the upper one driving twelve and the lower sixteen stamps. Immediately below are erected and in operation, twenty-one arastras, griding tailings; these are contracted out to three separate companies, the whole three employing a force of twelve men, who build their own arastras and do all the work with nothing furnished except (water) power—paying twenty-five per cent. of gross receipts to the mill company. The latter receive a clear profit of \$3,000 per annum from the tailings alone. The gross receipts of the mill company for 1866, was \$226,000. Whole cost of milling and milling does not exceed five dollars per ton. All the machinery, including twenty-eight stamps and twenty-one arastras, is driven by water power, using less than 150 inches. The company give constant employ to an average of sixty men, paying from \$50 to \$65, per

month, with board. Mr. Reis is emphatically, a shrewd manager, devoting his whole time and energies to his business, and is rewarded, as his balance sheet will show, with perfect success.

"Independence Mine," or "Independence Quartz Co.," H. F. Wood, President, and Superintendent. This enormous vein, ranging from 40 to 60 feet in width, is a continuation of the main trunk of the Reis mine. The pay strata varies from four to twenty-two feet in width, averaging \$13 per ton. The company employ sixty hands; have a fine 24-stamp mill, hoisting and pump machinery for working lower level, raising to the tunnel that leads to the mill. There are also four arastras that nett to the company \$1,200 per annum. The gross proceeds of the mine from July 1866 to '67, were \$114,000, and will increase handsomely the coming year. All the machinery is driven by water power taken from a flume, built and owned jointly by the two adjoining companies at a cost of \$50,000. Mr. Wood has evidently had great experience in mining, and although this mine was heavily embarrassed when the reins of management were assumed by him, he is now nearly out of debt, and will very shortly be beyond the dictation and control of creditors.

The "Chips" ledge, Higgins & Vander-walker, proprietors, is a beautiful six foot vein of dark brown gold-bearing quartz, and situated about two miles or more from the Reis mine, on the opposite side of the Yuba, and a little above Sierra City. This mine is well prospected by 275 feet of tunnel, tapping the ledge 200 feet below the surface. From this point they have tunneled north 125 feet and south 50 feet, making 175 feet in all at the same depth on the line of the ledge. They have found quite an extensive chimney of good average \$16 ore, and occasionally showing some very rich specimens. The present owners have recently come into possession of this mine, together with an old fashioned 4-stamp water mill. They will erect another eight stamp mill the present winter or spring following. Also drive another tunnel, striking the ledge 400 feet down. Mr. V. is old in the business of amalgamating, and thinks the question of "success" only a matter of time.

"Hawkeye," (Beard & Co.) This is an astonishingly rich vein situated on the summit of Downieville Buttes. This vein is very narrow on top, but has increased to thirteen inches at the depth of twenty-five feet. It was discovered during the past summer, and to give an idea of its richness, the company were offered a quartz mill for the first twelve sacks of rock taken out! They refused the offer and have built a 5-stamp mill themselves, to be used principally for crushing ore from the "Phoenix," another lead partly owned by the same company, and situated about 400 yards below the Hawkeye. This latter vein is from eighteen inches to two feet in width, and appears to be a fair quality of rock. Their mill is located on the river at the foot of the mountain, distance about one and a half miles from the mine; whole cost ready for running \$4,500. The writer has since learned that this company has suspended operations for the winter.

"Keystone" (Scammon & Co.) R. J. Jones, Superintendent, situated three and a half miles south of the Buttes on the opposite side of the river; ledge from two to six feet in width, averaging from \$15 to \$18 per ton. This company have a hoisting engine in their present working tunnel, placed 900 feet from the entrance, and 400 feet below the surface. At this point they have a shaft down 200 feet below the above mentioned tunnel, and are to sink 100 feet further to connect with their lower tunnel, which taps the ledge 700 feet below the surface. The mine will soon be well opened and in a condition to be a steady paying property. They have a fine 12-stamp mill driven by steam, 30-horse power engine. They employ 28 hands—wages \$60 per month and board. This property is spoken of in the highest terms, and is now running in "full blast," taking out "big pay."

#### EUREKA NORTH.

Although many have left this locality with their fortunes, and gone back to their native homes, there yet remains here a vast range of unwashed gravel, a portion of which is or will eventually be proven to be equal in richness to any yet worked. The recent rich "strike" at Fir Cap Mountain,

only one and a half miles from town, where they have taken out as high as \$800 to the man [per day?] is evidence, unquestionable that but a fraction of the precious metal has yet been found. The Fir Cap discovery is evidently a new channel, ranging through from the place of discovery to a point immediately east of Howland Flat. The gold is of a different quality from any yet found in this vicinity, is worth only \$16 per oz.; while that of Monte Christo and Eureka ranges from \$18 to \$18.50. Other appearances and indications also go to show to the close observer that an unknown channel bearing a new quality of gold is but just barely tapped. Miners hereabouts are all busy putting their claims in order for another season, for there is yet a great amount of money to be taken from known claims that are only partially worked.

#### HOWLAND FLAT.

Mining at this place is carried on quite extensively. All the different companies are engaged trying to scrape the bottom out from Table Mountain. The poorest of them appear to obtain enough to keep up expenses and still prosecute their search for richer placers, and some of them, particularly the Union company, are doing a heavy paying business. This mine is owned by E. A. Stroh & Bro., and Moyle & Bro., four partners. They have a drain tunnel over thirty-five hundred feet in length, and hoist all their pay dirt up an incline of 375 feet. Hoisting works are driven by water power ingeniously and economically applied, using the water over again in washing. This they own themselves, and have a constant supply sufficient for their own use. By invitation, the writer was present to witness a "clean up" from four days' run. Only about fifty feet of the upper end of the sluice was taken up, and inside of two hours' time a clean batch of over \$3,000 was panned out and ready to be deposited in the safe, no quicksilver being used except in the lower part of the sluices, which they clean up only once a month. The gold is coarse and easily saved.

The "Sierra" and "Fashion" companies, on the opposite side of the mountain, are evidently doing a fine paying business. Mr. Foss of the former and Mr. Chase of the latter are chiefs-in-command. Mr. Tabor, of the "Monumental" company, is striving diligently, and rumor has it that he has got a "good thing."

The "St. Louis" is not yet worked out, and apparently has a chance to exist for a long term of years. The town itself has only to slide over the bank and a new set of claims opened as good as any yet worked.

#### GIBSONVILLE.

Drift mining is being carried on quite largely in this district. Some rich and extensive mines are being worked with marked success. The writer hopes that upon his next visit he will be enabled to make a longer stay, and acquaint myself with more particulars.

#### PORT WINE.

Considerable is done here, evidently. All are making a good living and investing their surplus funds developing their claims.

#### MORRISTOWN.

The American company, Thomas Smith & Co. owners, are doing exceedingly well, realizing \$18 to the man during the water season, which lasts generally from six to eight months. Several other claims are supposed to be doing nearly as well. All are busily engaged fitting up to commence "playing" their pipes now very soon. B.

COAL in abundance has been discovered on the route of the U. P. R. R., west of Dale creek. Beds have been found equaling in extent those of England, and capable of supplying the whole country even if thickly settled to the Missouri river. Prof. Hayden, the U. P. R. R. Geologist, has examined it and pronounced it fit for locomotive purposes. So says the *Colorado Times*.

INSTANTANEOUS LIGHTING OF CANDLES.—At the Royal Palace at Berlin, 40,000 wax candles are instantaneously lighted by one match. The mode of proceeding is simple enough, the wicks being all previously connected by a thread spun out of gun cotton, on lighting one end of which all the candles are lighted simultaneously, and thus the whole of the 700 apartments are illuminated at once. In Russia the same ingenious method is employed for lighting up the churches on grand occasions.

TO BLEACH PETROLEUM.—Petroleum is bleached by shaking it successively and repeatedly with oil of vitriol, and then with a strong solution of caustic soda, allowing the oil to separate each time. A subsequent distillation will also greatly improve it.

\* It was in reference to this circumstance, that muriatic acid is formed in aqueous solutions of chlorine, that I considered the so-called Calvert invention inferior to the use of gaseous chlorine, that has been purified from muriatic acid by passing through water prior to use.

## Mechanical.

## Necessity of Further Methods for Producing Steel.

The growing necessity for the production of steel in large quantities, and to serve many purposes hitherto fulfilled only by iron, is calling loudly for a converting process which does not entail the very heavy cost incident to the adoption of the Bessemer process. Great as has been the benefits derived from the discovery of the Bessemer principle of conversion, in the possibility which has thereby been created for the more wide application of steel in the industrial arts; the want of a still more general application of this most valuable condition of iron, is perhaps more sensibly felt at the present time than ever before. As a consequence, researches in this direction, which seem to be almost exclusively confined to our English cousins, is constantly being applied to efforts to satisfy this great and growing want. At this particular time the attention of English ironmasters is being particularly directed to the process recently invented by Mr. Heaton, of the Langley Mills, Nottingham, for purifying pig iron, and converting it into a kind of steel, a brief description of which is given in *The Ironmonger*, as follows:

The mode of procedure is to place from seven to nine pounds of nitrate of soda in a movable bottom, which, with a perforated iron plate over the salt, is clamped to a cylindrical converter lined with fire bricks, and having an upright funnel to carry off the products of combustion. A charge of about fourteen hundred weight is run into this converter from a cupola. Rapid combustion takes place for about two minutes and a half. The flame then becomes bluish, and finally dark colored, after which a series of sharp explosions follows in rapid succession, and brilliant sparks are given off, something similar to the scintillations observable in the Bessemer process. When the action has subsided, the molten metal is run into ingots.

It is said that a substance closely resembling steel has been made by this process, but the experiments do not seem to have been yet conducted with that systematic accuracy which is desirable before the results can be relied on unhesitatingly. The trade will await with interest the further experiments in progress, and also the publication of analyses showing the nature of the products obtained by this chemical process. Already several Staffordshire firms have taken up the matter, and are said to be satisfied of the value of the discovery. They intend to apply it especially to the production of the cinder iron produced extensively there.

**TRINITY CHURCH SPIRE** of Brooklyn, N. Y., is being built of stone to the very summit. The topmost stone will be a cap completely covering the spire, but surmounted with a cross 11 feet high, the top of which will be 275 feet above the pavement of the foot walk—the spire for 18 feet below and including the cap stone, will be solid masonry, below that point it will be hollow and intersected with floors and strongly anchored with iron cross bars and braces. The mason work is all laid in hydraulic cement, which will render the structure so firm and compact, that were it to topple over it would be quite as likely to break in sections through the stone as through the mortar seams. It will be the highest spire in the country. It is built very slender; but is said to be very strong.

With a view of ascertaining the degree of penetration, when the rifling is carried to an extreme, Mr. Whitworth made a rifled barrel twenty inches in length, giving twenty turns to the rifling, or one in every inch, so that the velocity of rotation at the surface greatly exceeded that of progression. In firing it drove a bullet composed of lead and tin through seven inches of elm.

A DAM has just been built at Marseilles, Ill., on the Illinois river, which is 936 feet in length. It contains 618,000 feet of plank, and 21 1/4 tons of bolts and spikes.

**THE ENGLISH CHANNEL BRIDGE.**—The project of connecting England and France by a tunnel or bridge, seems to be followed up by a persistence which is full of promise for something which shall eventually become practical. Mr. Boulet, the engineer, who seems to have set all his heart and the energies of his life on the enterprise, is now getting up a company for the purpose of making experiments on a large scale, and half the capital required has already been subscribed. The bridge is to be constructed in metal, and supported upon piles carried down to the bottom of the Channel, the enormous weight to be alleviated by a series of gigantic bnoys. The wish of the inventor is now to construct a large model across some river or other, all the proportions being carefully observed.

**LARGE MINING PUMP.**—The proprietors of the Walla Walla Foundry, in Oregon, are building a pump with a cylinder five feet long by 16 inches in diameter. It will raise 72,000 gallons of water per hour, which would be an ample supply for a city of 200,000 inhabitants. The pump is for a gold mining company working a bar on the Columbia River.

A STATIONARY high-pressure steam engine was exhibited in Brooklyn recently, which is said to be the largest ever built in this country. The frame is a hollow tower of cast iron and weighs 33,000 pounds. On the top of this is the cylinder, 46 inches in diameter, and weighing 10,000 pounds. This cylinder is calculated for 1,200 horse power at half stroke, or 2,000 at full stroke. When the engine is in operation, the principal bearings are covered with cold water from a pipe which runs through.

AN ingenious arrangement for the artificial raising of water to supply power for a flour mill in Virginia, is briefly described as follows: "The process is nothing more or less than to introduce steam—the exhaust of a non-condensing engine is sufficient—into a reservoir connected by a pipe with a supply of water below, and then by a jet of water, to condense the steam, creating a vacuum, which is instantly filled with water to be discharged into a flume or reservoir, from which it is carried to the water wheel.

**AN IRON BRIDGE ON THE PACIFIC RAILROAD.**—It has been decided to throw an iron bridge across a deep ravine on that part of the Union Pacific line now being built. The length of the bridge will be 650 feet, in three spans, and it will be carried about 150 feet above the water. It was intended at first to fill the ravine, but it was found that it would take a year's time, and the cost would be greater than to build a wooden bridge.

A GERMAN engineer states that oxide of chromium is the best substance for polishing steel. The article can easily be prepared by heating bi-chromate of potash to redness. It is also used for painting on porcelain. One equivalent of chromic acid is reduced to oxide of chromium, and on well washing the residue of the ignition, neutral chromate of potash, is washed away and the ignition is left behind.

A NEW mode of testing armor plates for ships has been introduced and tried at Chatham Dockyard, England, in which the detection of interior and unseen flaws is made by means of a magnetic electric current. The results are described as satisfactory and conclusive, whether in plates or bars, the smallest defects even having been discovered.

A NICE MECHANICAL WORK.—It is stated that Mr. S. F. Gold, of Cornwall, Conn., an amateur millwright, has built and put in operation a water wheel thirty one feet in diameter, which he claims runs absolutely true, and can be kept in motion by the water through a two inch pipe.

It is said that the number of patents annually issued by the United States is three times greater than that of Europe. More than 200 patents a week have been issued at Washington for the last six months.

The first sleigh bell manufactured in America was made at Chatham, Conn. That town still enjoys a monopoly of this species of manufacturing, having seven factories within its limits that are devoted to it.

THE hardness of silver, so often experienced in carving it, is not so much owing to the presence of tin or lead as it is to the high temperature at which the silver is cast.

## Scientific Miscellany.

## Natural Crystallized Terpin.

Crystallized pitch, or as it is technically called "terpin," is well known in the laboratory; but its occurrence in nature was never met with until some time during the summer of 1866, when Mr. Charles Voy, of this city, a persevering and industrious amateur collector of mineralogical and fossiliferous specimens, and other matters of scientific interest, discovered its existence in Sierra county in this State. While Mr. V. was passing through that county his attention was called to the occurrence of a crystallized substance that was adhering to the fiber of a partially decomposed pine log, which had recently been dug up from beneath three or four feet of loam. The crevices and cavities of the wood were plentifully covered with these crystals, varying in size from a mere point to some three-eighths of an inch in length. They were of brilliant luster, and save in their form of crystallization, resembled small crystals of quartz. Supposing them to be crystallized pitch or "terpin," he collected some of the wood to which they adhered, brought it to this city and submitted them to Mr. Wm. M. Gabb, of the Geological Survey, who forwarded them for examination to Prof. S. W. Johnson, of the Sheffield Scientific School, at New Haven, Conn. Mr. Johnson communicated the result of his examinations to the *Journal of Science* for March, 1867, from which we condense as follows:

The crystals were colorless and transparent; the largest individual was three-eighths of an inch long, one-eighth of an inch wide and one-sixteenth of an inch thick. They were of brilliant luster and well terminated at the free ends. From their occurrence in buried pine wood and from their general appearance, it was at once suspected they might be identical with crystallized terpin. Their faint resinous taste and odor, not to be distinguished from that of the artificial substance, confirmed this view. On application of heat, the substance swelled and afterwards vaporized completely, without blackening and without leaving a weighable residue. On the cold parts of the tube silky crystals of anhydrous terpin condensed. This deposit is characteristic of terpin.

The amount of substance burned was but 0.0975 gm. The increase in weight of the potash bulbs and tube was 0.225 gm. This gives carbon 62.93 per cent. The calculated quantity was 63.16 per cent. The hydrogen determination was lost by the fracture of the tube employed in the examination.

The substance is therefore hydrated terpin or crystallized turpentine camphor  $C_{10}H_{16}O_2 + 2aq$ . Perhaps we should say it is one of the terpins, since, according to Berthelot, the oils of turpentine, on hydration, yield crystals of different degrees of solubility.

The formation of this substance in the buried tree presents no difficulties, since we know on the authority of Dumas, Deville and others, that oil of turpentine in contact with water, combines with the latter in absence of acids or other powerful agents of chemical change.

Prof. Brewer, who is familiar with the timber of California, is of the opinion that the wood to which the crystals were attached is that of a pitch pine, *Pinus ponderosa*. This appears to be the first recorded instance of the occurrence of crystallized terpin, native.

To obtain full information regarding the crystallometrical character of the substance, a portion of the same was submitted to Mr. John M. Blake, of New Haven, who also communicated the result of his examination to the *Journal of Science* of same date, from which we collate as follows:

A comparison of these crystals with terpin of artificial preparation leaves no doubt that the natural substance is hydrated turpentine camphor. The natural and artificial crystals agree closely in their angles, and have the same cleavage. The position and separation of the optical axes is alike in both.

Certain observations made at first, suggested that the two specimens might not be absolutely identical, but rather isomeric hydrates, such as were supposed by Berthelot to result from isomeric oils, derived from the same or different trees. Thus, hemihedrism constantly occurred on the natura-

crystals, which has not been observed on the artificial. The proportional development of the planes was strikingly different. The two specimens manifested opposite pyroelectric characters, in so far that the free-growing extremities of the natural crystals were antilogous poles, (developed negative electricity on heating,) while those of the artificial crystals, first examined, were the reverse, or analogue poles.

On further investigation, these points of difference disappeared. By recrystallizing from alcohol and other solvents, much variation was produced in the planes. On recrystallizing from alcohol, natural terpin lost its hemihedral character, and in case of crystals grown radiating from a support, presented the analogous pole to the solution, like the artificial substance when deposited from the same solvent. Crystals of each, when free-growing in alcoholic solution, had the same development of the planes, and with each there was the same perceptible difference in the proportions of the planes at the two ends of a crystal, by which the poles could be distinguished; but no corresponding difference could be detected in the angles of these terminal planes.

The crystals were found in Sierra county, and not in Shasta, as reported in the *Journal of Science*.

## GENERATION OF STEAM BY HEATED METAL.

Carefully conducted experiments made by immersing iron raised to different temperatures in boiling water, show that more steam is generated, in a given time, by iron of a red heat, just visible in daylight, than by the same piece of iron heated to a white heat. This of course arises from the greater quantity of steam-atmosphere formed around the white hot iron. It has also been further ascertained that the steam generated bears a strict relation to the weight of the metal—being about one pound of water, evaporated from the boiling point, to every nine pounds of red hot iron immersed therein.

The most singular development in connection with these experiments, is the fact that cast iron, raised to the same temperature, generates more steam than wrought iron, the former generating one pound of steam for every eight pounds of iron; while it requires 8 1/2 pounds of wrought iron to generate one pound of steam.

**THE HONEY ANTS OF MEXICO.**—A most curious species of ants is found in Southern Mexico, known as the "honey ant." Among these curious insects a portion of the community secrete honey in the abdominal cavity, until they swell up to the shape of small grapes. These individuals form the storehouse for the balance of the community, and during the winter they are dispatched in succession, to furnish food for the other members of the colony. They also bear much relation to the workers among the honey bees, and, like them, do not possess the power of fecundity. It is a puzzling question among the inquirers into the "origin of species" from a scientific stand point, to comprehend how the sterility of the working ants and bees was ever introduced through the medium of modified descent—the Darwinian theory—or how it is kept up from generation to generation among those individuals who have no posterity to inherit their peculiarity of structure. How, by modified descent, is the honey-making capacity of the "honey ant" transmitted, when those who possess it are year after year, systematically destroyed? These facts seem to point, with almost irresistible logic, to the theory of "special creation."

**CHEAP SUBSTITUTE FOR ANILINE.**—A substance having all the properties of a compound of aniline, has been found to exist in the bodies of a cephalopod of the Mediterranean, known to naturalists under the name of *Aplysies Depilans*. It is estimated that the cost of this substance, after all expenses of fishing and extraction had been included, would be only about \$5 per pound.

The first employment of electricity for firing gunpowder dates as far back as 1751, and is due to Franklin; and in 1767 Priestley turned his attention successfully in the same direction.

## New Patents and Inventions.

Under this heading we shall mention, from week to week as occasion may demand new and important inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

## PATENTS RECENTLY ISSUED.

70,995.—IMPROVEMENT IN FURNACES FOR ROASTING ORES, HENRY GOLDING, SILVER CITY, NEVADA.:

I claim, 1st, The working of ores in molds or chambers, substantially as described.

2d, The arrangement of molds containing ores to be roasted, so that they can be gradually brought nearer the fire or removed from it.

3d, Removing the molds containing ores from the fire, while undergoing the process, so that the decomposition may be conducted without additional heat, by the placing of a freshly filled mold containing unroasted ore upon the top of a mold that has been removed from the fire, for the purpose of utilizing the excess of heat.

5th, The arrangement of furnace, cooler and crane as described.

6th, The conducting of the flue through water, or its equivalent, for the purpose of condensing the volatile matter, when and in connection with ores roasted in molds.

The object of this invention is to provide a furnace for roasting ores containing the precious metals, and consists in placing the ore, pulp or tailings in a plastic or wet state in cylindrical molds, having vertical pipes or plugs through them, which form flues for the heat and flames of the furnace to pass up through, which roasts and dries the ore, rendering it fit for easy amalgamation. The base of the molds are provided with plates, either separate or attached to them, and are furnished with lugs with which to raise or lower the molds, changing their position from top to bottom of the furnace, or transferring them to a cooler place at one side of the furnace by means of a crane. The object of the cooler is for the purpose of utilizing the waste heat, and when the lower mold in the furnace is roasted, it is removed by means of the crane into the cooler, and a freshly-filled mold or molds are placed upon it, so that it may become partially dry before being placed in the furnace. A pipe is placed on the top of the furnace for conducting away the gases and volatile matter from the ore, which passes through a horizontal water tank, which condenses the volatile parts and saves the quicksilver, as in case of working tailings.

71,141.—FURNACE FOR SOLDERING.—Lewis Cnting, San Francisco, Cal.

I claim a soldering-furnace, having heaters G G, provided with plates H H, for utilizing the heat of the surface, substantially as described, and in combination with the heaters provided with plates H H.

I claim filling the center of the heater with gypsum, fire-brick, or some slow conductor of heat.

I also claim, in combination with the heaters G G, the top cover of the furnace, formed of gypsum, fire-brick, or other slow conductor of heat, substantially as described and for the purposes set forth.

71,167.—HORSE HAY FORK.—Isaac J. Hatbough, Santa Clara County, Cal.

I claim the slotted ring hinge B D, or its equivalent, and the claw-shaped teeth c c c c c c c, in combination with the rake-heads C C and levers E E, all arranged and operating substantially as above set forth.

71,195.—IMPROVED GATE FASTENING.—Geo. McCoy, Antioch, Cal.

I claim a gate-fastening, having the holt, a, operated by the lever, B, and spring, c, together with the securing-lock, g, or its equivalent, constructed and operated substantially as and for the purpose described.

This invention consists in providing an improved gate-fastening, which shall be at once secure, simple and easily operated. This is attained by constructing a case of metal or other substance, through which a holt passes. This case is fastened to the gate, so that the end of the holt enters the post and holds the gate securely closed, there being a spring which keeps it always in place. A small lock, of ordinary construction is placed inside the case, so that when the main bolt is in place, the bolt of the lock can be entered into a slot in it which keeps it from moving. A convenient handle is attached to the main holt, by which to operate it.

71,221.—IMPROVEMENT IN LAMP-EXTINGUISHERS.—Fred. Rohrer, San Francisco, Cal.

I claim a lamp-extinguisher, constructed and arranged substantially as described, as a new article of manufacture.

The object of this invention, as its name imports, is to provide a device which may be applied to any kind of a lamp, but chiefly to be used on lamps employed in burning fluids from which explosive compounds may be generated, and from which danger may be apprehended in suddenly turning down the wick or blowing out the light. This device consists in providing a means by which two thin plates of tin or other metal are so arranged as to be thrown up by the side of the lamp-tube by means of a lever so as to close over the wick and effect an instantaneous extinguishment of the flame, without turning the wick down or blowing into the chimney. When the lever is released, these plates drop back to their former position, without disturbing the oil or wick—the lamp being left in condition to be lighted again. These extinguishers may be made to emit any shape of wick tube, and are applicable to any lamp now in use at a trifling expense.

71,228.—CARRIAGE TOP PROP.—Anson Searls, San Francisco, Cal.

I claim, 1, The tubular joint-bar standard B.

2, The clamp or claw, or equivalent.

3, The screw-bolt C that passes through the joint-bar standard B, and a part of the clamp, holding them firmly together and in position.

4, The combination of the joint-bar standard B with the clamp A, in combination with the screw C, for the purposes substantially as described.

71,267.—IMPROVEMENT IN STEAM ROTARY VALVES.—Louis Begon, San Francisco, Cal.

I claim the arrangement of the openings b b, and two exhaust-passages, B B, in the conical valve, A, in combination with the posts, F F, G G, and exhaust posts H and H, in the case, C, substantially as described.

The object of this invention is to provide a valve for steam-engines, which shall be so constructed as to be exactly balanced, and move with the least possible friction. It also relates to cutting off the steam at any desired point, so that it may be expansively used for a greater or less portion of the stroke. In order to accomplish this, the inventor constructs a valve, formed like the frustum of a cone, which is placed in a case into which it fits steam-tight, and which has flanges, by which it is bolted to the steam chest; the case in which the valve moves being entirely surrounded by steam. The valve and case have openings at the side, so as to allow the steam to circulate freely through it; and the valve, which is supported at each end, may be moved by an ordinary eccentric, or by a cam, by which it is made to revolve so far as to admit steam to the passages connecting with one end of the cylinder from opposite sides of the valve at the same time; while the ports which open to the other end of the cylinder, also on the opposite of the valve, are closed, thereby making the pressure on one side of the valve counteract that on the other. The valve has an arm which allows the end of the eccentric-rod to be moved to a greater or less distance from the center of oscillation, thus opening the parts to a greater or less degree, as may be required. When a cam is used to move the valve, it is placed on the shaft in such a position that by its motion the valve will be completely opened at once; and by a second cam, it will be closed at any point at which it is desired to cut off steam from the cylinder, these quick motions being rendered possible by the perfect balance of the valve. When the valve is in position so as to cover all the ports and admit no steam to the cylinder, the pressure exerted by the steam from its interior will be equal upon every side, so that the valve will not be pressed against the case in any direction, any more than if it were a plain hollow cone, with a pressure exerted from the interior. As the valve moves about its center, so as to admit steam to the ports connecting with one end of the cylinder, the pressure is removed from two points diagonally opposite in the valve, at the same time, while the pressure in the direction of the receiving ports and the exhaust-passage remains; but, being at the opposite points, still it is neutralized and is of no effect.

71,528.—IMPROVEMENT IN CHURNS.—Andrew N. Elzy, Placerville, Cal.

I claim a churn-dasher, with a central revolving shaft, B, carrying oblique arms E, and square arms G, alternating with each other, and specially arranged upon the shaft.

To accomplish this the inventor contrives

a cylindrical barrel to hold the cream, through the center of which a shaft passes, standing upright, and turning in a step at the bottom. This shaft is revolved by a crank, and may have gearing to give it any desirable speed. On the shaft, and radiating from it, are arms so placed that they form a sort of screw, the tendency of which is to force the cream to the bottom of the churn, in the center, where it passes to the sides to again undergo the same process. Two posts are placed at opposite sides of the cream would otherwise require.

CALIFORNIA BLACKING.—Several ineffectual attempts have been made to introduce the manufacture of blacking into this city, but without success until quite recently. After surmounting many difficulties, chief among which were the cost of the boxes, and the difficulty of making an article that would not mold, a party has finally met with the fullest success, and the production of "Austin's Brilliant Paste Blacking," may now be considered one of the permanent industries of San Francisco. The oil, hone black, acid, boxes, and everything connected with the manufacture, is of California production. The factory is able to supply the entire demand of the coast, the total importation of which has heretofore been about 400 gross per month. In addition to the home market, a foreign demand has already sprung up, as the proprietors have received an order for twenty-three gross from Yokohama; so that the Japanese will soon be made to shine with California "brilliant."

NEW INCORPORATIONS.—Articles of incorporation have recently been filed in the County Clerk's office in this city as follows:

GREEK RUSSIAN SCLAVONIAN ORTHODOX EASTERN CHURCH AND BENEVOLENT SOCIETY. San Francisco. Dec. 26th. Trustees: Semlovich T. Franetta, M. Cheriari, N. Davovich, P. Zenovich, S. Chielovich, T. Constantin, G. Tankovich, S. Maztinovich, N. Makrie, G. Lazarovich, P. Aristotle, P. Radovich, and Charles Baum.

ELECTION OF OFFICERS.—CONCORDIA ASSOCIATION.—San Francisco. Dec. 27th. President, Jules Cerf; Vice President, H. Robitschek; Recording Secretary, D. E. Speyer; Corresponding Secretary, Theodore Liberman; Treasurer, M. Toklas; Directors; Levi Strauss, D. S. Bachman and Jos. Naphtaly; Local Directors: Benj. Price, L. Hildberghauser and H. Oppenheimer.

PENNSYLVANIA furnishes 73½ per cent. of all the coal produced in the United States.

MARKET STREET HOMESTEAD ASSOCIATION.—J. S. Lutz, Secretary. Office, 305 Montgomery street, corner of Pine, San Francisco. 2v15

ANOTHER CALIFORNIA ENTERPRISE.—A factory has been started in this city for the manufacture of AUSTIN'S CELEBRATED BRILLIANT PASTE BLACKING. This preparation not only produces a most brilliant polish; but, unlike imported blacking, it is pronounced the best LEATHER PRESERVATIVE ever introduced. Trade supplied twenty per cent. less than any imported article. Factory, No. 1 Montgomery Court, near the corner of Broadway. 26v15-3m

JACOB SNEW, Pioneer Photographer, 612 Clay street, north side, four doors above Montgomery, (late 315 Montgomery street), takes all kinds of Photographs in the best style of the Art. He would invite especial attention to the new "Cabinet Photographs," which he is taking to perfection. 16v14f

SECRETARYSHIP FOR MINING COMPANIES.—A gentleman of education, ability and experience, is desirous of procuring a position as Secretary, or Assistant Secretary, in some good Mining Company. Has most unexceptionable references. Address "SECRETARY," at this office. 6v15f

Save Your Teeth.—Do not have them extracted without first consulting a good Dentist. The loss is irreparable, and, in many instances, unnecessary. DR. BEERS, corner of Montgomery and Sutter streets, over Tucker's Jewelry Store, makes a specialty of filling the fangs of dead Teeth, and building up broken crowns with pearl gold—thus restoring them to their original usefulness and beauty.

Call and examine the work. Finest quality of artificial work also manufactured. 16v14-1f

CO-OPERATIVE UNION STORE.—This is becoming one of the most useful institutions in the city, and the Mechanic and Laboring Man fully appreciate it. They are now enabled to buy their Groceries and Provisions twenty per cent. cheaper than ever before, and the very best articles in market. The store is located at 115 Sutter street, Lick House Block. 2v15f

## AN INSTRUCTIVE BOOK!

Prof. LAYRES'

## ELEMENTS OF COMPOSITION,

## BELLES-LETTRES AND ORATORY

For Scholars, Teachers, Lawyers all Professional Persons, and those of Common

Education, who would improve the

Eloquence and Effectiveness

of their Composition and

Manners of Address.

Price, postage paid, . . . . \$1.10

This is a new publication, and in style and treatment of this important subject, is original, simple, plain and comprehensive. The author, PROF. LAYRES (a most successful Teacher of good standing in California, and a sound thinker and reasoner) in his preface says: "The method pursued by the Author in developing the subject of Composition, is both the synthetic and analytical. The former is necessary to teach the theory, the latter the practice of the art; and as these are both indispensable to the scholar, so are also the two methods, as the sequel will show."

The Work has lately been approved and authorized by the State Board of Education for use in the Public Schools. To further illustrate the varied and popular endorsement the book has so rapidly received, we quote the following

## RECOMMENDATIONS:

It is simple, concise, and well arranged. It seems to be a work of great value.—John Seelt.

I am prepared to concur in the recommendation of the Honorable Superintendent of Public Instruction.—J. C. Felton.

After a careful and thorough perusal of the same as it was in my power to give, I came to the conclusion that, for conciseness, correctness, and precision of definition, as well as for completeness and simplicity of style, it was, and would be, without a rival. I regard your work as the best of its kind. I know of but few men in any profession who would not be benefited by its careful study.—Wm. H. Hull.

I regard it as one of the best treatises upon these important branches—perhaps the only one obtainable, possessing equal advantages—combining comprehensiveness with conciseness, and of such simplicity in its arrangement as to be readily understood by the advanced pupil.—F. W. Hulch.

It is admirably arranged to develop the correct idea of the analysis and synthesis of language, and the amplification of ideas into sentences and periods. The style is clear, terse and pleasing. I do not hesitate to recommend it as a great acquisition to our text books.—James Denman.

I am happy to express my conviction of the value of the whole treatise. It would give me much gratification to see so thorough and excellent a treatise emanate from young California.—Martin Kellogg.

I recommend it to all those who wish to obtain a book that will give them definite ideas on this subject, and teach them to express their thoughts and feelings in a clear, simple, and forcible manner.—Caroline L. Atwood.

I regard the book about to be published as far superior to any work extant upon that subject.—Wm. S. Hunt, A. M.

I believe the work will be a valuable and much needed addition to our school text-books.—Herman Perry.

You have brought the results of a profound analysis, and made them available, in a practical form.—J. H. Brynton.

I can recommend it particularly to my young friends of the legal profession, as a source from which they may be able to learn much of value as special pleaders and advocates at the forum.—John Curry.

The subjects upon which you treat have heretofore been too much neglected in the education of young men in America. Exactly calculated to interest. It will soon become a necessity in every lawyer's library.—Charles A. Tuttle.

Its clearness and comprehensiveness make it easy.—G. W. Boite.

A gentleman of varied learning and ripe culture, who has half a dozen languages at his tongue's end. He seeks to teach the student not only how to take sentences apart, but how to construct them. His system has the merit of simplicity. We know of no work in which can be obtained so lucid an exposition of the elements of composition, and such valuable assistance in learning how to put his ideas into language. Prof. Layres has done the cause of popular education good service.—S. F. Dutton.

This is a San Francisco book by a San Francisco author. It contains 166 pages, and is altogether creditable to San Francisco. It meets a public want, and meets it in a form and size cheap and convenient, and in reach of the humblest.—Alta California.

The writer, the lawyer, the minister, or the statesman, may study its rules and definitions with profit. Nothing conduces more to the purity of a national literary taste than a general and thorough knowledge of the rules by which the construction of language is governed.—S. F. Times

Prof. Layres plunges at once "in medias res." He seizes a sentence (which is the unit in composition, whether written or spoken) holds it up before you; tears it to pieces before your eyes—or rather, we should say, neatly and skillfully dissects it—displays one by one its several parts; makes you thoroughly acquainted with each, in its entirety; and then shows you how to put them together again. A series of such exercises, presented in a complexly so gradually that you do not feel the difficulty, and the thing is done; you are master of the subject.—Mining and Scientific Press.

Its design is to show that ideas can be so arranged as to increase their power; in short, to teach the mechanism of composition, eloquence and oratory. A desideratum long felt is supplied.—S. F. Examiner.

This is an age in which the occasions now rapidly multiplying, when educated men, and women, too, are called upon to express their views in writing, either for public or private inspection and criticism.—Stockton Independent.

The most eminent educators in California give it their hearty approval, and we concur.—Marysville Appeal.

Not only one of the best of its kind, but, what is still better, one of the briefest. It contains 166 pages.—Virginia Enterprise.

Price, \$1.10. Sent by mail, postage paid, without extra charge. Liberal reductions made to the Trade, Teachers and Schools, ordering by wholesale. Orders received by our Traveling Agents.

THE BEST IN AMERICA.

The Mining and Scientific Press,

is the Largest and Best MINING AND MECHANICAL Newspaper issued in the United States.

DEWEY & CO.,

Patent Agents, Publishers, Book and Job Printers, 505 Clay Street, San Francisco.

THE MINING AND SCIENTIFIC PRESS is published every Saturday. Each issue comprises sixteen pages (64 columns), and furnishes more valuable reading matter than any other weekly journal in California.

To the practical mechanic, metallurgist, prospector, millman, mine holder or worker, it is worth many times its subscription price.

SAVING PRECIOUS METALS,

All progressive information, in fact, transpiring with the times—which cannot be obtained from books.

THE MINING AND SCIENTIFIC PRESS is now in its FIFTEENTH VOLUME, and enjoys a large circulation. It received the following hearty endorsement of the California Miners' State Convention, held at Sacramento, January 17th, 1866:

RESOLVED, That we regard a mining paper or journal of great importance to the mining interests of California, and recommend the MINING AND SCIENTIFIC PRESS, of San Francisco, to the consideration and support of the miners of the Pacific coast.

TERMS OF SUBSCRIPTION.—One year, \$5; six months, \$3.—In advance. Send for sample copies. Remittances may be made by mail at our risk. If parties sending will register their letters, or send money order.

AS AN ADVERTISING MEDIUM throughout the whole Pacific States and Territories, the Press is unsurpassed. Rates moderate.

SPECIMEN NUMBERS of the Press and Patent Circulars, sent free.

DEWEY & CO., San Francisco.

National Mineral Land Law, Instructions, Blanks, Etc.

Copies of the Act of Congress, approved July 26th, 1866, relating to the Location of Mineral Lands, together with the instructions to the "United States Registers and Receivers and Surveyors General," from the Commissioner of the General Land Office Department of the Interior, dated at Washington, Jan. 14th, 1867, can be had at this office.

Generous Compliments.

The following is a sample of the generous acknowledgments which we frequently receive. We can only return thanks for such gentlemanly obligations, and assure our friends of our best endeavors to merit their respect and kindness.

HYDRAULIC PIPES AND NOZZLES

For Mining purposes, Iron Steam Pipe furnished with Fittings, &c. Coupling Joints of all sizes. Particular attention paid to Distillery Work. Manufacturer of "Garratt's Patent Improved Journal Metal."

Highest Market price paid for OLD BELLS, COPPER AND BRASS.

SIXTH INDUSTRIAL EXHIBITION

UNDER THE AUSPICES OF THE

MECHANICS' INSTITUTE, SAN FRANCISCO.

The undersigned, acting under authority from the Mechanics' Institute of the City of San Francisco, take great pleasure in announcing to the public that they have resolved upon holding an Industrial Exhibition in the month of August, 1868, on a much larger scale than was ever before attempted on this coast; and they make this early announcement of their intention, that all who may desire to participate shall have ample time for preparation.

A programme, embracing rules and regulations for the government of participants, with a list of Premiums to be awarded, &c., is receiving such careful and carolful attention as the importance of the enterprise demands and in due season the same will be made public by circular letters widely distributed, and by advertisements in the leading journals of this coast.

Executive Committee:

Minerals for Sale.

A COMPLETE COLLECTION OF VALUABLE MINERALS, together with a large collection of Fossils, from the Trias, for sale. Every object numbered and explained. May be seen at FFEIFER'S DRUG STORE, No. 210 Post street, San Francisco.

## Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

OWING to the late storm which prevailed, so far as heard from, over the entire State, our mails have failed to come to time. Our readers will, therefore, have to be content with a slight summary this week. However, from what we have, we should judge that wherever the weather permits mines are doing well, especially those working placers. There can certainly be no want of water after such a "Noah's deluge" as we have been having during the past week.

## CALIFORNIA.

## Alpine County.

*Miner*, Dec. 14th: The Silver Creek Mill is grinding up Tarshish ore, preparatory to turning out a batch of silver bricks next week.

The drift south from the shaft of the Tarshish, 75 ft. below the tunnel, is encountering large quantities of first and second class ore.

This week we have nothing of special note to chronicle in regard to new enterprises here, though there are one or two in process of incubation which we believe will, at no distant day, revolutionize the present mode of mining in Alpine.

## Amador County.

*Ledger*, Dec. 21st: Last week, the owners of the Kennedy mine cleaned up a "run" of 110 tons of rock, worked at the Tubbs' mill, and received \$3,500—an average of about \$32 dollars per ton, pure gold, while the sulphurets, which are known to be rich, are not taken into account.

## Calaveras County.

*Chronicle*, Dec. 21st: The long-expected water has at last reached Cat Camp, and miners have commenced operations in earnest. We are informed that the returns received by the companies which commenced work are flattering in the extreme—the claims yielding from \$6 to \$8 per day to the hand. There is no abatement in the excitement regarding that section of the county, and the rush in that direction continues as great as ever.

*San Andreas Register*, April 21st: While the hands at work in the mine of Bovee & Co., at Angels, were away from the shaft, at dinner, a huge cave occurred in the shaft, which disclosed an entirely new vein of fabulous richness, of the existence of which the proprietors and workmen had until then been utterly ignorant. Threads of gold were literally spun through the rock; in fact, it appeared like quartz pebbles strung on threads of gold.

Fowler, Sanborn & Co., recently discovered a lead of plumbago, about one-half mile from San Andreas. The lead is from four to five feet in thickness, and has been traced to a considerable distance. They dissolved a quantity in water, then allowing it to settle, poured off the mud and water, leaving the plumbago at the bottom, which seems to possess all the qualities of the best black lead. We have a "brick" in our possession.

## Colusa County.

*Marysville Appeal*, Dec. 19th: All the property known as the Mosello Copper and Smelting and Crushing Works, in Colusa County, is advertised at sheriff's sale on the 28th inst. at Colusa.

## Kern County.

*Havilah Courier*, Dec. 14th: The St. John mine, at Sageland, continues to yield well, and since our previous mention of it \$5,000 has been obtained. The New York and Clear Creek Mining Co., near this town, are progressing finely, and getting out rich ore.

## Mendocino County.

*Colusa Sun*, Dec. 14th: Silver mines have been discovered on Eel river, in Mendocino County.

## Mono County.

The Benton correspondent of the *Esmeralda Union*, says: Our residents, however, are confident of the correctness of the new process discovered by Dr. Dozier, and the richness of our mines. The furnace is completed, and is now being dried by slow fires. The Dr. intends to make the first trial of a ton of Comanche ore. He says if the material of which the crucible is composed, will stand the action of the chemicals used in reducing, there is no doubt of the success of his mode of operating.

## Nevada County.

*Transcript*, Dec. 21st: Rich diggings have recently been struck by a party of miners, about three miles from town, on the old road to Jones' Bar. The company have been at work some weeks sinking a shaft,

and a few days since they struck gravel containing an abundance of coarse gold. Quite a number of claims were located in the vicinity on Thursday, by persons who have been watching the developments of the successful parties.

Dec. 18th: Hubbard and others have recently commenced work upon a ledge at Grizzly Ridge, the rock of which gives evidence of being exceedingly rich, assaying about \$1,800 to the ton.

23d: J. L. Sandford has left in the Recorder's office, for record, a deed of 50 claims of 300 ft. each, on Greenhorn Creek. The location commences at Lewis and De Golia's mill dam, running thence up the stream 15,000 ft., to the Nevada and Red Dog crossing. The company has been incorporated under the name of the Newark Mining Co.—capital stock \$100,000—the stockholders being mostly San Francisco men. They now own all the ground from the mouth of Greenhorn to the Red Dog crossing, together with 4,000 ft. in Missouri Cañon.

The North Bloomfield Co. have purchased the right of the Middle Yuba river, heretofore owned by the old English Co., and the water will be conducted by ditch to Graniteville and Bloomfield. On the Chalk Bluff range the work of opening the channel, by the Chalk Bluff Gravel Co. is a great one, and the Newark Co. has undertaken to build a flume that will stand the severest freshets, and that will open nearly eight miles of some of the richest channel mines known in the county.

The Gold Hill quartz mill, at Grass Valley, has been doing a very good business of late in crushing quartz boulders, picked up in the bed of Wolf Creek and other places. The result has been so satisfactory, that the Town Talk Co. are now erecting a mill on their claims at Howard Hill, for crushing the float quartz with which their claims abound. Some years ago, the owner of the Canada Hill mill, near Nevada, employed a man with a team to pick up float quartz on Gold Flat, in Little Deer Creek, and other places, which were crushed at the mill and yielded fair returns, and at times a considerable profit was realized. The quartz probably yielded as well as the average of that crushed from the ledges, and the cost of picking it up is far less than mining it.

*Grass Valley Union*, Dec. 19th: A beautiful specimen of quartz and gold was taken on Tuesday last from New York Hill. The value of the gold in the piece is about \$50, while as a specimen the value is much more. Messrs. Dibble & Byrne have corralled the quartz in their cabinet.

Dec. 20th: The Scandinavian Co. have been, for several weeks, running a tunnel from Deer Creek to their shaft, calculating to strike the ledge and shaft at the same time. On Tuesday last the workmen struck the ledge before they reached the shaft, and the rock taken out shows rich in gold, much better than that lately crushed at Palmer's mill, Nev., paid over \$25 per ton.

Dec. 21st: During the last week all of the leading mines about the town have been doing well in taking out rich rock. The New York Hill mine has largely overpaid its expenses with rich specimens alone, leaving other splendid rock for the mill which is going up. The Dromedary has its back still up on specimen rock, while its common dump pile is a sight good for sore eyes. The Empire, on Ophir Hill, holds its own and is turning out quartz which will go up to a handsome figure. The Wisconsin is crushing \$70 quartz. The Eureka and the North Star are making their usual rich returns. Taken altogether, the mines around Grass Valley for the past week have exceeded any week's yield for several years.

*Grass Valley National*, Dec. 18th: A quantity of splendid specimen rock was taken out last night at the Empire mine, Ophir Hill. We have heard the value of the specimens placed at about \$5,000.

A piece of quartz was picked up by a gentleman in Wolf Creek yesterday, for which he refused \$100 in coin.

Dec. 19th: A piece of quartz was picked up this forenoon, on Pike Flat, containing, we should judge, about \$20 in gold.

Another lot of specimens of the richest kind were taken from the New York Hill mine, yesterday, one of them about the size of a man's fist, containing, it is estimated, about \$150 in gold.

Dec. 23d: In addition to those noted during the week, we saw on Saturday evening, at Delano's hanking house, another lot of specimens from New York Hill mine—and rich indeed were these.

A number of our specimen hunters are on the *qui vive* to-day, the rain storm having cleared off a large quantity of surface dirt, and thus afforded them a good opportunity of pursuing their peculiar profession.

Dec. 17th: The miners in the Empiro Co's mine, Ophir Hill, on Saturday, struck

a 20-inch ledge in the south drift of the lower level. The rock gives evidence of being as rich as any heretofore taken from the mine.

*Excelsior*.—Grass Valley *National*, Dec. 20th: Meadow Lake district is closed up for the season. The snow on the summit was five ft. deep last Tuesday, and it has been falling quite heavily since that time.

## Placer County.

*Auburn Stars and Stripes*, Dec. 19th: Thos. Cain and two others have located a claim on a quartz ledge near the Good Friday mine. Cain has his pockets filled with specimens of the rock which were literally studded with gold. A few tons like the samples shown us would be enough to satisfy any reasonable man. These specimens were taken from the ledge at a point five ft. from the surface.

The editor is of the opinion that a good 20-stamp mill located at Ophir in that county, would find constant and profitable employment.

The Fred Mallett claim has been opened by an incline shaft to the depth of 50 ft. At a depth of about 25 ft. from the surface drifts were run on the ledge, in following which very fine rock was encountered. Work was then resumed on the incline and continued until the present level was reached, when another drift was run on the ledge, and at a distance of eight ft. from the shaft the workmen came upon rich rock, the discovery of which has created great excitement in mining circles.

*Herald*, Dec. 21st: The McGonagle, Perry & Co. claim, on this ledge, is now completely timbered, and is being worked night and day. As good pay has been struck in the new shaft as was found in the old one; and that yielded the *ore* by the pound to the pan.

*Dutch Flat Enquirer*, Dec. 21st: Six miners of Gold Run have purchased the ditch owned by E. M. Hall, and formerly known as the Bartlett and Thomas ditch. The price given was \$50,000.

Mr. Taef is now engaged in running a shaft to strike what is known as the big tunnel at a depth of 80 feet.

The Dutch Flat is one of the oldest claims in the district, and with but one exception has probably yielded more gold than any other one claim in this vicinity. The average yield of this claim is about \$3,000, making a clean up every 15 days, using 400 in. of water, and working seven men. They have a fall for their water of about 200 feet from the head, and have a face on their claim extending probably 200 ft.

## Plumas County.

*Quincy National*, Dec. 14th: Prospecting in Cherokee District is as lively as ever. New ledges are being found almost daily. The works of H. C. Bidwell & Co., and Judkins & Kellogg are in full tide of success.

H. C. Bidwell & Henry McClellan have recently bought the Berge mill and mine, on Rush Creek, and have commenced crushing quartz. The ledge is ten feet wide—with good walls—and that the quartz is paying.

The mines at Blackhawk are paying handsomely. The lower claim of Turner, Reynolds & Co cleaned up 21 ozs. last week.

Messrs. McNulty & Co.'s claim was filled up and sluice boxes washed away by the recent flood on Mill Creek. It is estimated that it will require two or three months to re-open the claim.

The Carriboo correspondent writes: Chris. Lind & Co. are making from \$10 to \$25 per day to the man. Tom Orton's claim is paying an ounce per day to the man. Joe Hickman's claim continues to pay rich.

The *Grass Valley National*, of Dec. 17th, speaking of a party of young men who left that place to prospect in Plumas County, says: "From a letter recently received, we learn that they succeeded in finding sufficient encouragement to locate claims about 25 miles from Quincy. The writer says their 'claims prospect gloriously.' Quite a number of the miners in that section, the writer adds, 'have been looking at our diggings, and the adjoining ground of late, and two companies have located claims in our vicinity.'"

## Tulare County.

*Visalia Delta*, Dec. 18th: The White River mines are more prosperous at this time than usual. The Philadelphia Co. are sinking new shafts on two or three different ledges, which are proving to be large as well as rich. Messrs. Brooks & Co. are also doing well in the way of working over their old tailings, while at the same time they are developing their mines and placing them in such condition that they will produce a large amount of paying ore during the coming season.

## Yuba County.

*Marysville Appeal*, Dec. 21st: Messrs. Keudall & Boyle, successful miners at Bangor, started a 4 stamp (capacity 8 stamps) steam mill yesterday for crushing blue ce-

ment, hoisted through a shaft 70 feet in depth. This mill was manufactured at the Marysville Foundry, and is said to be the prettiest cement mill machinery ever put up in the State. The cement taken from this mine is rich, being thickly studded with gold visible to the naked eye.

## COLORADO.

*Times*, Dec. 30: Things are looking up in general, and in Black Hawk in particular. There are now 16 or 17 mills running as hard as they can in Black Hawk, and in consequence trade is generally improved there. Almost all the mills around Central City that have water at hand are busy.

We saw yesterday 4 or 5 nice looking bars, the result of some runs recently made of ore from Mr. Fleming's property in Nevada Gulch. Mr. Fleming says the property is looking first rate, and the pay dirt is quite plenty.

Robert Teats has just finished a run of Smith & Parmelee ore, with most satisfactory results. The average yield was about 5 ounces to the ton; value \$18, coin, or between \$80 and \$90 a ton.

*Denver News*, Dec. 5th: Great excitement prevails in Boulder city occasioned by a party under the lead of a man named Hawk Nickirk, who have jumped and hold by force the Hoosier lode. Some 40 armed men keep forcible possession of the lode, and declare that they will hold it at all odds. In the ledge a crevice of 7 feet in width is developed, (neither wall reached) the poorest part yielding \$400 per ton in silver, and about two feet yielding at a rate which would give Georgetowners cold shivers. Until recently, Gold Hill was looked upon as gold-bearing exclusively, but now it is discovered, by testing lodes which seemed worthless in early days, that the district is richer by far in silver. From Gold Hill eastward to within a mile of the out-hills, silver indications are abundant. Some rich discoveries have recently been made within three miles of Boulder city, one yielding \$120 per ton by assay from the blossom rock, with a mass of solid ore 5 feet thick. Some valuable discoveries of silver have recently been made near the mouth of Middle Boulder.

## IDAHO.

*Lewiston Journal*, Nov. 28th: The Washington correspondent writes as follows: Snow on the summit of the Florence mountain is 15 in. deep. Matters are in a flourishing condition; about 125 more men will winter in this camp this year than last.

The William's & Maxwell mill will commence operations to-day. The cold weather has reduced the water in their ditch, so that the machinery does not move with the speed that is desirable; about 125 tons of ore lie at this mill, ready for reduction, and some of it is very rich. It is principally from the Hic Jacet, Windfield Scott, Andy Johnson and Washington leads.

The Hic Jacet Mill Co., have their building erected, their battery set, their boiler put together and riveted and the work of constructing their mill for progressed, considering the time in which they have had to operate. All their machinery and supplies for the winter have been safely laid upon their grounds. The engineer says that the mill will be in full operation before the 1st of January, 1868.

James Crenan leaves here to-morrow for San Francisco. He is authorized by the Trustees of the Miner's Mill Co., to make a purchase of the machinery for their mill, and ship the same to Lewistown. The money is already on the way to San Francisco, so that we have a full prospect of the third mill in camp next spring.

The new discovery of placer mines east of South Salmon will attract many from this camp early in the spring.

About 25 men are wintering on South Salmon, and mining on the bars. The Dwight brothers are among the number, and are reported as having good paying claims.

*World*, Nov. 30th: We learn from Silver City that the Poorman ledge, which had somewhat failed of its original famous richness for a few months past, has again developed a wealth of ore equal to, if not surpassing, the first taken from it. Other ledges in Owyhee are reported to be also greatly prospering.

## MONTANA.

*Post*, Dec. 7th: Boom & Molitor cast a gold brick last week of the value of \$21,154.41. This, together with the nine monster silver bricks, in the National Bank window, made a large display of material wealth.

The silver bricks on exhibition at the First National Bank make a poor devil wish he was in that kind of brick-making business. There were six mammoth fellows, the total valuation of which was something over \$9,000.

The Golden Gate Co's mill at Brown's Gulch started up on Tuesday. The rock being crushed is silver ore from the Lonaine lead of Prof. Eaton. It is intended to experiment on a few cords of the rock to test the capacity of the mill for saving silver. If successful in this, there will be ample supply of ore furnished to keep the mill constantly employed, as the silver leads of the district are numerous, rich, of good width, and several of them developed to a considerable extent. Prof. E. has also some ten cords of gold ore from the Brackett and Red Wing leads ready for crushing in case the silver ore needs other appliances than those now in operation, and Mr. Conner is also developing gold leads in the immediate vicinity of the mill, and near the city.

Libbia's ten stamp mill situated at the head of Grizzly Gulch, near Hendries, will start up on Monday next.

The Helena Herald reports all the mills running in the vicinity of Helena with great success. The Philadelphia Enterprise Co. are cleaning up from \$4,000 to \$6,000 per week. The St. Louis & Montana Co's mill at Phillipsburg is proving a great success. There have been several small clean ups. One brick of silver, with a little gold, weighed between 90 and 100 lbs, and was worth some \$250.

**NEW MEXICO.**

The Santa Fe Gazette says: That extensive preparations are being made for working the Moreño mines next season. A company with \$100,000 capital has been organized for the construction of a ditch from the Little Red river to the mines.

**NEVADA.**

The Pino Grove correspondent of the Virginia Enterprise of Dec. 19th, says: Our mines were never looking better or being more thoroughly worked. They contain thousands of tons of low grade ores, which will yield from \$10 to \$20 per ton and is easily extracted, but will not at the present time more than pay for mining and working. This ore is left untouched as discovered in developing the mines, being reserved for future use, and only the high valued ores are extracted.

The Wheeler mine, the major part of which was purchased by Baker & Faddock of San Francisco, is being thoroughly worked, and extensive bodies of ore have been disclosed, 1,000 tons of ore, valued at from \$20 to \$100 per ton, can be immediately taken out, if the Co. were prepared to work it. About 40 tons of ore taken from this mine by Goodrich & Clark, contractors, recently, worked \$75 per ton. Thomas Wheeler had some of the sulphuret rock, that was taken out prior to the sale, worked at the Pioneer mill, which yielded about \$23 per ton, in free gold, and the tailings, which were saved, assayed \$31 per ton, in free gold. The dimensions of this mass of sulphuret ore have not yet been ascertained, although a cut has been made in it of about 20 feet. This mass of vein has a west or foot wall of clay, which is from 20 to 30 feet thick—the eastern or hanging wall has not as yet been discovered.

The Poorman Co., have run a 200-foot tunnel without any satisfactory results, other than the making of the tunnel and striking a 10-foot vein of rock which will work about \$20 per ton.

Work is to be commenced on the Cadman Co's claim some time next week. This claim is supposed to be the eastern extension of the Wheeler.

Ex-Lieut. Governor Crosman is engaged in taking rock out of one the deposit series of ledges. It will go about \$30 per ton in free gold.

The Wilson and Midas claims were never looking better, and both are taking out a fine class of ore.

Toombs & Abraham, who have leased a portion of the Wilson mine, are taking out the richest kind of rock, which ought to yield \$150 per ton. They have struck a large vein of quartz which ranges from 8 to 15 feet in width, with no end as yet to its depth. They had 16 tons of this rock worked in the anastra, recently, which paid \$126 per ton, and still later 10 more tons which went \$100 each.

The Ophir Co. have let a contract for running a tunnel 200 feet, to Langford & Goodrich, who are to have the privilege of taking ore out of any part of the claim for a period of 9 months after the completion of the tunnel.

The Pioneer mill is doing good work and making excellent returns from rock out of the Wheeler.

Wilson's new 10-stamp mill is nearly completed, and will be set to pounding out ore in a week or so.

It is probable that the Wheeler Co. will in a short time erect a mill of its own.

**Tennessee.**

Unionville Register, Dec. 11th: The Etna correspondent writes: The Goldconda mine was located by White & Webb, about 14 months ago, who finally secured the ownership of the entire mine of 1,200 feet. They subsequently sold one half of their interest to an Eastern Co., for a small sum of money and one-half interest in a mill. The other half interest the Co. are negotiating for at the sum of \$75,000, in gold. The ore averages a very handsome yield, and the cost of mining, hauling and milling does not exceed \$10 per ton. The Goldconda mine is one of the great wonders of the age. It is about 14 feet in width, lying between two regular slate walls, and dips westward at an angle of some 70° from a perpendicular, and pays from the very surface. The superintendent assures me that the ore can be extracted for two years to come without going under ground. Fairbanks & Co. have a contract for hauling 10,000 tons of ore from this mine to the Co's mill at Fairview.

**Reese River.**

Revere, Dec. 10th: Since the purchase of the Santa Elena by the Tannehill Co., things have assumed a lively appearance in the district of Washington, and the present and future activity will compensate for its long neglect. Work on the Tannehill Co's mine in Webster cañon progresses rapidly. The smelting furnaces are being erected. They have begun to sink upon the Santa Elena mine from the tunnel, and are pushing the work with all the force that man can be used to advantage. There are now about 300 tons of ore upon the dump, the whole of which will give a good yield of silver.

The Utica and Herkimer Co., is getting its machinery upon the ground preparatory to building a fine 15-stamp mill. In the meantime the mines are being worked, and will produce a good supply of ore for the mill.

The company which purchased the original location upon the great Northumberland ledge district, is quietly doing its work. Some busy prospectors in the district discovered recently several small veins holding exceedingly rich ore, which they are extracting to send to mill. The owners estimate that the ore will produce from \$500 to \$1,000 of silver per ton.

Our attention was called this morning to an assay by Bault & Stetefeldt of the pulp of the Diana ore, which gave 90 per cent. of silver. The sample assayed was thoroughly roasted at the Mettacom mill, where there is being reduced. The yield of the pulp is an indication of superior work, for the ore produced by the Diana mine has always been regarded and treated as very rebellions.

Dec. 11th: Our attention was called today to some 6,000 lbs. of ore from W. F. Leon & Co's claim on the great El Dorado ledge in the Silver Bend district. This lot is the first installment of 10 tons which are to be brought to Austin for reduction. The ore is in large masses and evidently of superior quality. It is identical in appearance with the best ore from the Highbridge and Transylvania.

Belmont Reporter, Dec. 14th: A gentleman just from Morey district, has laid upon our table some very fine ore taken from the Magnolia and American Eagle ledges. That from the Magnolia is a mass of compact black sulphuret, with little or no quartz. It was taken from a depth of about 30 feet from the surface, where the vein is three and a half feet thick—two and a half feet of which is solid ore, which, as taken from the mine yields at the Hot Creek mill about \$260 a ton. The ore from the American Eagle is a chloride, having a greenish-yellow color, and pays at the same mill about \$225 per ton. The greater portion of it pulverizes to a fine powder in the process of extraction, and has to be carefully sacked. There are 25 to 30 men at work in this district.

During the past week there has been received, for molting and assay, at the assay office of Thomas Cahill & Bro., 4,320 ozs. of ernde bullion.

The El Dorado South this week forwarded 6,600 lbs. of ore to Austin for reduction which was not to be excelled in richness, and it will work up to a high figure. A few days, however, have elapsed since the shipment was made and developments have progressed in the meantime. The body of ore in the incline has increased so wonderfully in richness during the past few days as to create astonishment in the minds of all who behold it. Compared to that which is at present taken from the mine, the lot sent to Austin will rank only as medium, or second class. The incline has now been driven 12 feet below the point at which the good ore was first struck. It is following the foot wall and is about 5 feet in height. Four feet of the vein immediately adjoining

the foot wall is a mass of mineral, probably the richest body of argentiferous ore ever disclosed in any mine in the State, while the remainder above will probably mill upwards of \$100 per ton. The thickness of the ledge at this point is conjectured to be from 25 to 30 feet, but it has never been cut through; its width is not known with certainty. The total length of the incline is 112 feet—giving a vertical depth from the surface to this body of ore of about 70 feet. It is the most extraordinary strike ever made here and enhances the value of all mining and other property in this section of country.

**Washoe.**

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

Enterprise, Dec. 17th: We were yesterday shown two assays of ore from a mine called the Nil Desperandum, in the town of Union, Union district, Nye county, which proves the mine to be a valuable one. A specimen of first-class ore showed by assay, \$812 14 in silver and \$49 98 in gold; total, \$862 12, and a piece of the poorest ore yielded \$66 55 in silver and \$6 30 in gold; total, \$62 85.

The repairs to the Bower's mill being completed, it is now in full operation crushing ore from the Bower's mine.

The Central mill, in this city,—“old perpetual motion”—which has for some time been lying idle, has again resumed work.

The Crown Point hoisting works have been stopped for about 24 hours for the purpose of mending a weak place in one of the boilers.

Dec. 18th: The snow is and has been falling and the winter of our discontent has fairly set in.

**UTAH.**

The Salt Lake Vedette says that decomposed quartz from the Sweetwater mines yields \$824 88 per ton.

Gen. Dodge and Gen. Rawlins paid the district a flying visit, and after examining some of the claims, expressed themselves highly pleased with what they saw, declaring it the richest and most extensive mining district they had ever seen.

**A PREDICTION MORE THAN VERIFIED.**

It is astonishing how the predictions of eminent men, but little more than a quarter of a century ago, are rapidly approaching verification. All remember the sanguine predictions of Whitney, the first projector of the Pacific Railroad. While Mr. Whitney was considered a visionary theorist by most people, there were some whose comprehensive minds quite fully grasped the great facts with regard to the future of our country, which were then but so dimly shadowed forth. Among this latter class was the late Fenimore Cooper, who, more than twenty years ago, and before the annexation of California was thought of, or even our title to Oregon was definitely settled, wrote as follows: “If the past can be any pledge for the future in American history, there are now living those who will see steam extended across the continent from the Atlantic to the Pacific, and the Stars and Stripes flying at each end.” It was a bold prediction for the distinguished novelist; but it will be realized in about half the time which he allotted as the period for its consummation.

SOMETHING NEW IN PHOTOGRAPHY.—An illustrative work descriptive of the country along some 400 miles of the line of the eastern division of the Pacific Railroad, is now in press in New York. The illustrations consist of about 400 photographic views, duplicated by photographic impressions, to the number of the edition which will be printed. The facility with which such impressions may be duplicated bids fair to eventually supersede engraving to a very great extent.

GAS.—The word gas originated as follows: About 200 years ago a German chemist, observed in some medicinal springs in Germany a peculiar aciferous substance—carbonic acid gas—which from its peculiar other qualities he termed *ghost* (ghost), from whence we obtain our present English word gas.

Any of the above Books will be furnished by return mail or express, on receipt of the price with postage added. Any other books desired will also be furnished at the lowest San Francisco retail prices. Address, DEWEY & Co., Mining and Scientific Press Office, San Francisco. 14 1/2 Namf.

THE PYRENEAN SINKING.—A Madrid paper says that scientific researches have established the fact that the Pyrenees have, in the last twenty years, lost thirty meters in altitude. Supposing the depression to continue, our worthy contemporary calculates that, after the lapse of one thousand years, the chain that separates Spain from France will realize the celebrated words, “*Il n'y a plus de Pyrenees*,” by disappearing altogether, in which case the Ebro will fall into the Bay of Biscay instead of emptying itself into the Mediterranean.

The composition of atmospheric air was first discovered by a German chemist, named Van Helmont, about 150 years ago.

## Canvassing Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. A. G. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. Jan. 11, 1866.

Mr. C. T. Raney is our duly authorized agent for Sacramento County. Nov. 23, 1867.

Dr. L. G. Yates is our duly authorized traveling agent. July 6, 1867.

Mr. A. B. Butler is a duly authorized traveling agent for this paper. July 15, 1867.

Mr. H. C. Northrop, is our duly authorized agent for Oregon, Washington, Idaho, and Montana. Aug. 17.

OUR NEW YORK AGENCY.—Mr. M. A. LATEROP, formerly of California, is our authorized Agent in New York. Parties in the Eastern States who desire to subscribe for or advertise in the MINING AND SCIENTIFIC PRESS, can address Mr. L., at No 726 Broadway, for the present. Nov. 26, 1867.

## San Francisco:

Saturday Morning, Dec. 28, 1867.

## Notices to Correspondents.

**ASSAYER.**—The enormous discrepancy claimed to exist between the ordinary mode of assaying and the results stated to be attainable by more accurate, but, we suppose, novel methods to be introduced, we presume, in company with renewed trial promised to be made with Rivot's furnace, arises, we expect, from the loss occasioned by the small amount of the precious metal invariably evolved along with the fumes of lead oxide in the course of enpellation, or that sinks into the cupel. By experiments performed in the School of Mines, London, two important facts appeared to be confirmed: first, that according to the decrease of the silver enpelled, the loss of that metal very slightly decreases, provided the ratio of lead employed be constant; secondly, an increasing ratio of lead produces an increasing loss of silver. From experiments it was found that when 25 parts of silver are cupelled with ten times their weight of lead (250 parts), the loss of the former is 1.05 per cent. When 10 parts are cupelled with 100, the loss is 1.10 per cent., and with 1 part to 10, 1.20 per cent. With regard to the second conclusion, it was ascertained that when the proportions of lead and silver are as 1 to 1, the percentage loss is 0.55 per cent; when 10 to 1, 1.52; when 20 to 1, 1.68; and 35 to 1, 1.88 per cent.

**J. D. F. B. S., AND OTHERS, Pioneer City, Idaho Territory.**—We have to apologize to these correspondents for not noticing their communication and enclosure received some two months ago, by reason of its having become accidentally mislaid. The enclosure consisted of a small sample of sulphurets from the Duncan extension. Free gold is perceptible throughout the sample, which latter consists chiefly of galena (sulphide of lead), and sulphide of iron (pyrites). With such a composition, it is not at all surprising that only \$13.33 per ton was obtained in this city by the ordinary pan process. Such an ore requires previous manipulation if anything like a satisfactory return is looked for. A gentleman, who has been accustomed to the treatment of such ores, has taken a small portion for further examination, and if anything specially interesting results, the fact will be communicated to our correspondents. Further details respecting the condition in which the sulphurets are found is desirable, such as, are they much mixed with rock, or other refuse matter.

**T. W. A., ESMERALDA.**—If, by the application of chlorine in the milling and arastra process, is meant the possibility of using this gas in the batteries and open arasstras, we can inform our correspondent that in this form the chlorination mode is quite inapplicable. In the present number will be found a paper by Prof. Rowlandson, in which many of the chief properties of chlorine are described, and will be more fully explained in one or more to follow, to which we call T. W. A.'s attention.

THE BEST GRANITE for building purposes, is found in Russia. A deposit of granite has lately been found in Minnesota, said to be quite equal to the best found anywhere.

CONTINENTAL Life Insurance Company, 302 Montgomery street, corner of Pine.

## The Distinguished Dead of 1867.

The death record for the past year includes a considerable number of notable names. The scientific ranks have been thinned; the literary world has lost of its members some who have been celebrities in prose and verse; and men who occupied prominent public positions have fallen. Among the

## SCIENTIFIC MEN

who are gone, it is fit that we mention first,—as the foremost and most brilliant of those luminaries which, though they may pass beyond our field of vision, still leave an inextinguishable line of light to mark their course,—

**MICHAEL FARADAY.**—Born in London in 1794, he died in August last, at the age of 73. The son of a smith, and apprenticed in his youth to a book-binder, he was a "self made man." A lover and a student of science, he succeeded at the age of 20, in edging himself into a scientific atmosphere, by securing, through the influence of Sir Humphrey Davy, a position as assistant in the laboratory of the Royal Institution. The irrepressible spark of his genius was soon detected by Sir Humphrey, and he became his fast friend. Young Faraday was elected to the Royal Society in 1824. He published several volumes upon chemistry, optics, electricity, and magnetism, and in 1833 became Professor of Chemistry in the Royal Institution. Honors have been conferred upon him by many of the literary societies of Europe. Since 1835 he has been in receipt of a government pension, and during the last ten years of his life occupied a residence at Hampton Court, specially allotted to his use by the Queen.

**LORD ROSSE**—whose name is well known in connection with the monster telescope, 52 feet in length, which he constructed—and who, though not a creator of worlds, gave "a local habitation and a name" to numbers of them which had previously appeared as mere patches of light, without form and void,—died on the 31st of October last, at his seat, Birr Castle, King's county, Ireland. He succeeded to the earldom in 1841; received the honorary degree of L. L. D. from the University of Cambridge in 1842; was elected President of the Royal Society in 1849, and a member of the Imperial Academy of Science at St. Petersburg, in 1853.

**THEOPHILE JULES PELOUZE**, the friend and associate of Gay Lussac and Liebig, died on the 31st of May last, at the age of 60. He was the author of several works upon chemistry as applied to different manufactures. At the age of 23, he became Professor of Chemistry at Lille.

**PROF. ALEX. D. BACHE**, Chief of the United States Coast Survey, died on February 19th, at the age of 60. He was born in Philadelphia. In 1825 he graduated with the highest honors at West Point, and became Lieutenant of Topographical Engineers. In 1827 he was elected Professor of Mathematics in the University of Pennsylvania, and afterwards President of Girard College. In 1843 he received the appointment which he held at the time of his death. He was well known as a thorough scholar, and for the practical applications, valuable to navigators, which he made of his scientific acquirements.

## INVENTORS.

**ELIAS HOWE, JR.**, died October 4th, in Brooklyn, N. Y., aged 48. He was notable as the author of one of those inventions, which, so to speak, revolutionize the world in the course of a single generation. Every body knows the history of the sewing machine. The story of Mr. Howe's early struggles and final splendid success, has been repeatedly told, and we will not dwell upon it here.

## AUTHORS—PROSE.

The name of Miss CATHARINE M. SEDGWICK may be given first under this head.

The precedence universally accorded to the sex, and to venerable age, both demand it. She was eighty years old at the time of her death,—in August last,—and had been before the public as a writer for nearly half a century. She was born in Stockbridge, Mass., in 1787. Her charming style of story-telling made her a general favorite, and she retained her position to the last. In 1857, at the age of seventy, she published a novel with the title "Married or Single?" which is said to be as lively and graceful as any of her younger productions. Her books will live;—and she will be remembered with kindly feeling, not only by thousands of delighted readers, but also by scores of personal friends.

**SIR ARCHIBALD ALISON**, the historian, died during the current year, at the age of 75 years. He was born at Kenley Vicarage, in Shropshire, England. His father was a clergyman of the Established Church. Sir Archibald is most widely known through his "History of Europe,"—an elaborate work, but one which has been criticized with considerable severity.

**VICTOR COUSIN**, the philosopher, died in Paris, of apoplexy, January 14th, aged 75. He was the founder of the Eclectic School. Of humble origin, he gave early indication of remarkable talent; and in 1812, having completed the course of study in the Normal School, was appointed Assistant Greek Professor in that institution. In 1815 he began to lecture at the Sorbonne. As a teacher, he was extraordinarily popular; and as a lecturer he attracted crowds. He became a member of the French Academy in 1830.

**PROF. CHAS. ANTHON, L.L.D.**,—died in New York City, the place of his birth, in August last, aged 70 years. He graduated with honor at Columbia College in 1815, studied law, and was admitted to the bar in 1819. At the age of 23, he was appointed Assistant Professor of the languages in the above named college, and in 1835 was placed at the head of the Grammar School connected with that institution. He was a wonderfully industrious worker; as is proved by the fact that besides the faithful attention to his duties as instructor, he published some fifty volumes, as text books of Greek and Latin authors, with copious notes and commentaries, many of which have been republished in Europe.

**J. D. B. DEBOW**, died at Elizabeth, New Jersey, on February 27th, aged 47. His name is known in connection with *DeBow's Review*, which was established by him in New Orleans in 1845, as the organ of the slave interest. In 1848 he became Professor of Political Economy and Commercial Statistics in the University of Louisiana. During the war, he held some important position on the Secession side under Jeff. Davis. After it, he determined to devote his journal to the Southern interest, under a system of free labor. He was undoubtedly an able man.

**CHAS. AUGUSTUS DAVIS**,—alias "Major Jack Downing," the newspaper *Nasby* of thirty years ago, died in New York, January 26, aged 72 years.

## POETS.

**FITZ-GREENE HALLECK**, died on Nov. 21st, at his birth-place, Guilford, Conn., aged 73. Unquestionably a genuine poet, he was nevertheless, in his early youth, compelled by straightened circumstances to become an accountant in New York. Showing an aptitude for business unusual in one of such tastes, he was highly valued by his employer, the well-known Jacob Barker. He became cashier, and continued in association with the house until he was secured by John Jacob Astor to occupy an important position of trust in connection with one of the many speculative enterprises in which that millionaire was engaged. Mr. Astor, at his death, left him a moderate competence, with which he retired to his native town, where he spent the remaining years of his life. Entirely unambitious, and philosophically indifferent to fame or wealth, he wrote only for recreation; although his genius was of a high order, and might have enabled him to take rank among the foremost.

**NATHANIEL PARKER WILLIS**, died in New York January 21st, aged sixty. For the greater part of his life he has been before the American public as poet, sketch-writer, and editor. Some of his poetical effusions, written in the hey-day of his youth, have sufficient merit to entitle him to rank under this head; but upon the whole, the position which he occupied was that of the highly cultivated *litterateur* of faultless taste, rather than that of poet. For a number of years past he has edited the *Home Journal*.

**ALEXANDER SMITH**, died near Edinburgh, Scotland, on the 5th of January, aged 37.

His early poems gave promise of extraordinary genius. For a time his name was on every tongue, and his poems were the theme of universal discussion in the literary world. His exquisite word-painting was likened in richness to that of Keats. But his productions of a later date did not fulfil the promise made; and it seemed at last to be acknowledged that he lacked the fertility of true genius. How far his continued ill health contributed to this, it is impossible for us to say.

## OTHER MEN OF MARK.

**GOV. JOHN A. ANDREWS**, of Massachusetts, died suddenly, Oct. 30th, aged 50 years. He was a man of no ordinary merit. Admitted to the bar in 1840, at the age of 22, he practiced his profession with distinction until 1858, when he became a member of the Massachusetts Legislature. Since that time he has been five times Governor of the State; and ever since the commencement of the late war, has been prominently before the public of the whole country. His course throughout has been marked by proofs of unusual energy, self-reliance and integrity. His unexpected death in the midst of his usefulness is universally deplored.

**HON. JOSEPH A. WRIGHT**, of Indiana, U. S. Minister to Prussia, died in Berlin, May 11th. He has been a public man since 1843. First, member of Congress from Indiana, then Governor of that State,—which last position he held for six years,—he was, in 1857, appointed by President Buchanan, Minister to Prussia. Having returned home on the accession of Lincoln to the Presidency, he was appointed a second time by President Johnson to fill the same place, and remained therein until his death.

**GEN. THOMAS FRANCIS MEAGHER**, the "Irish patriot," fell from a steamer at Fort Benton on July 1st, and was drowned. At the time of his death, he was acting Governor of Montana, though nominally Secretary of that Territory. He was 44 years of age. In some respects, he was a remarkable man. As an orator, he is spoken of as unrivalled. His enthusiasm in the Irish cause, and his frank and generous nature, endeared him to his countrymen.

**HON. ARTHUR P. HAYNE**, formerly United States Senator from South Carolina, and aid-de-camp to Gen. Jackson at the battle of New Orleans, died in Charleston, S. C., in January last.

**CHARLES F. BROWNE**, known to all mirth lovers as *Artemus Ward*, died of consumption, in London, March 5th, aged 33 years. He was born, we believe, in Cleveland, Ohio, and was a printer by occupation. His humor, which was irresistible, was of a peculiar character—entirely *sui generis*. Although his writings were well received in this, his own country, and on the whole appreciated—as a lecturer he only reached the zenith of his popularity in England. There he created a marked sensation. The jolly John Bulls were never tired of laughing at his grave jokes; and their public journals were full of articles, analyzing and explaining their peculiar and subtle keenness. A generous and genial friend, and a true gentleman, he was beloved by all his associates. As he gradually sunk under his disease, and it became evident that he must die in a foreign land, he was carefully and tenderly nursed by friends, who, though but lately strangers to him, had already learned to love him as a brother. He devoted, by will, the bulk of his fortune, amounting, we believe, to some \$20,000, to the founding of an asylum for aged and disabled printers. "*Eecit monumentum ere perennius!*"

**MAXIMILIAN**, the self-styled "Emperor of Mexico"—that scion of the ancient and noble House of Austria, who, seduced by the Mephistopheles who sits upon the throne of France, weakly forsook a dukedom for an *ignis fatuus*, was, in August last, as the whole civilized world knows, done to death by the outraged people over whom he essayed to reign. With the pride of his race, he scorned to flee the country while there was yet time, although he must have known that his cause was lost, and further effort hopeless. His untoward fate will not be without effect upon the crowned heads of Europe. His body has only recently been surrendered to the request—not demand—of the Imperial mourners who constitute his sorrowing family; and is now on its way to the tomb of his ancestors.

**PERSONAL.**—Mr. B. F. Kenney, late Superintendent of the Ophir mine, is now connected with the Pacific File Factory, in this city. As he is said to bring with him a practical acquaintance with all the minutiae of this business, acquired years ago in the East, he will no doubt add much to the already well sustained reputation of the establishment. See card elsewhere.

**A California Steam Plow.**

We last week briefly referred, under the head of "New Inventions," to the fact that Mr. P. H. Standish, of Martinez, had invented a steam plow, or rather a steam earth-cutter, which is intended to effect the purpose of the plow, by cutting up and finely pulverizing the earth, without turning it over in a furrow. The objects sought to be gained by such a modification in the structure of this most important implement are: First, the placing of the fulcrum upon which the machine depends for its work, within the machine itself, rather than upon the horse or steam power, by which it is driven. Various devices have heretofore been attempted to combine the motive power of the steam plow with the machine itself; but we have yet to hear of one which has been successful, unless such shall prove to be the case with the invention of Mr. Standish.

The English, who have, thus far, accomplished more than all the world beside in steam plowing, have abandoned the attempt of combining the motive power with the machine, and all their successful plows are driven, or rather dragged, by engines placed upon one or two sides of the field, the plow being thus dragged back and forth by a stationary engine. Mr. Standish accomplishes his work, as will more fully appear below, by revolving cutters connected with the motive power itself. The second object gained is the rapidity with which the work can be done, and the small, comparative amount of power required for its performance. If it works as expected, it will do double the work of the best English machines—or about 35 to 40 acres per day.

To afford a more clear idea of how the work is done, we append the following description of the invention which has appeared in the last number of the *Contra Costa Gazette*:

The machine consists of a massive frame of six by twelve-inch timber, 24 feet long, by 12 feet wide, mounted upon two carrying wheels 8 feet in diameter and 34-inch face, with two steering wheels, forward, 4 feet in diameter and 15-inch face. The carrying wheels are geared to a pulley shaft which is belted to the engine driving pulley, and one or both wheels may be thrown in or out of gear at pleasure of the operator, and the machine turned in its own length, and the locomotive movement may be perfectly graduated to the speed of the cutters and character of the ground. The cutting apparatus consists of four shafts set in a vertical frame attached at the rear of the machine; these shafts are connected by crown gearing to a horizontal pulley shaft on the upper part of the vertical frame, and the pulley belted to the engine driving pulley.

The foot of each of the four vertical shafts is furnished with four stout radiating arms of three feet sweep, in the ends of which arms the cutting arms are vertically set. The shafts are geared to revolve in opposite directions so as to divide the side strain of the cutting force; and the periphery of each set of arms strikes just within that of the other, so as to leave no ridges upon the ground after the cutters. The adjustment of the machine for ordinary ground will give the cutters one hundred and fifty revolutions a minute, each knife cutting an inch slice every revolution; and as the earth, after being cut, is subjected to trituration by the rotary and forward movement of the knives, it must be left well pulverized and prepared for seed, while the locomotive power required for the machine will be but little more than that necessary to overcome the inertia of its weight, as the traction draft of the cutters will be very light.

Capt. O. C. Coffin, a gentleman of energy, enterprise and means, well known in Contra Costa and the neighboring counties, has taken an interest in this invention, and will secure for it a thorough, practical trial. An experimental machine is about completed and will be subjected to a thorough test in a few days. It is designed to cut a breadth of twelve feet. For the experimental trial an ordinary thrashing engine and boiler will be used for the power—the whole apparatus weighing over seven tons; but with an engine especially adapted to the work, the weight will be greatly reduced. Application for a patent for this invention has been

**HANSBROW'S CHALLENGE**  
**Deep-Well, Mining and Double-Cylinder Patent Pumps.**

These Pumps combine all the advantages of the common Lift and the Double-Acting Suction and Force Pumps, and are equally fitted for all—Household, Furn, Mill, Manufactory, Brewery, Ship, Railway, Mining, and other purposes, and are especially recommended on account of their lightness, compactness, durability, cheapness, and the facility with which they can be placed in any position.

They are adapted for Hand, Steam, Horse, Water, or Wind Power. They are more durable in all their parts than any other Pumps of the same power.

**Four-Inch Deep-Well Pump.**

The Valves are of the simplest construction, and can be readily taken out by loosening two common nuts. They are not liable to get out of order, and can at all times be removed without the aid of a skillful mechanic.

The lower valves of these Pumps work upon inclined seats, which prevents sand or other matter that the Pumps may take up, from remaining under the valves, or stopping the flow of water.

These Pumps are worked with less friction, and consequently require less power than any other Double-Acting Pumps of equal capacity.

All sizes, from 2-inch to 8-inch Cylinder, manufactured by the Pacific Iron Works, GODDARD & CO., and for sale by the Agents,

made through the MINING & SCIENTIFIC PRESS PATENT AGENCY, and a beautifully finished model, with the necessary drawings and papers, were forwarded to Washington by the last steamer. Good mechanics and others, having a knowledge of this class of machinery, have expressed much confidence in its practicability. Should it succeed, it will prove of immense value to this State, as well as to the country at large. We trust all interested will realize their fullest expectations.

**Patent Steam Water Lifter.**

Received First Premiums at the California State Fairs of 1866-7.

Send for Circular.

A Steam Pump without Engine, Piston, Plunger or Inlets, using both the expansive and exhaust power of steam, and doing more work with the same amount of fuel, than any other Pump driven by steam power. It is applicable to either lighter or heavy work, whether for mining, irrigation, or other purposes. It has been used of various capacities, from 50 to 30,000 gallons per hour, and can be made of any size required. It is not injured by sandy or muddy water. In light of lift it is limited only by the strength of the boiler used.  
For further information, apply to M. & A. WILCOX, Proprietors, No. 19 Front Street, between I and J Sts., Sacramento, Cal. 25v152am3m

POSTMASTERS are requested to punctually inform us of the removal of subscribers of the Press from their locality, or of neglect to take the paper out of the office from any cause—when the subscriber omits that duty himself. It is not our intention to send this journal to any party longer than it is desired. If we inadvertently do so, subscribers and others will please inform us.

**Perry Davis' Vegetable Pain Killer.**  
Sudden colic, coughs, etc., can be cured immediately, as hundreds can testify, by mixing about one teaspoonful of Perry Davis' Vegetable Pain Killer with four tablespoonfuls of molasses, mixed well together, and taken as your coughing spell comes on; three teaspoonfuls of the mixture will answer for a dose. Also rub a little of the Pain Killer on the hands, and inhale the scent of it into the lungs. After you have taken the medicine, bathe the throat and around the collar-bone, also across the upper part of the breast and down the sides, if they have been made sore by coughing, and you will soon get relief if you do not neglect it too long. The sooner the medicine is applied, the more speedy the relief. In all cases, if you do not get relief in thirty minutes, take it again, and bathe freely according to directions.  
Prices, 25 cents, 50 cents, and \$1 per bottle.  
Sold by all Druggists, Grocers and Medicine Dealers everywhere. dextm

24 1/2 H. J. BOOTH & CO.

**INDIA RUBBER** will dissolve in naphtha, and if thinly spread on a surface, the naphtha will evaporate and the rubber regain its former properties. To make india rubber hard mix it with sulphur and some lamp black, red or white lead, according to the color you desire, and subject it to a temperature of about 360°. Goodyear's patent covers this process, however.

A NEW trade has appeared in London, being a body of men who deodorize and manipulate, partly, decayed fish, so as to render them saleable as food. The London *Field* describes their mode of carrying on business and says that few iniquities connected with the food supply are more disastrous.

**Gas.**—It is not the quantity of gas which determines its value, but its illuminating power. Rosin gas has about double the illuminating power of ordinary coal gas. Albertine coal is much richer than Cannel that is, it will yield gas of a higher illuminating power per cubic foot.

A HUGE water wheel, forty-five feet in diameter, is in operation at the Freiberg silver mines, 300 feet below the surface.

**Rates of Postage on Printed Matter to Europe and Asia.**

The Post Office Department has made arrangements by which a number of European and Asiatic countries, hitherto beyond the reach of our mail communication except by letter, are brought within the range of delivery of all, or nearly all, United States mail matter. It is a singular fact, unknown probably to most persons who have not occasion to learn it by unpleasant experience, that there was a considerable region in the civilized world where an American traveler might not receive a newspaper directly from home.

Under the arrangement now completed, prepayment of postage (sometimes at high rates), is made necessary in all cases. The following official statement gives a full list of the countries—with some of which there has been regular communication—that are now included in the delivery by way of Hamburg and Bremen:

Letters of postage on newspapers and other printed matter (periodicals, etc.) sent from the United States to countries in Europe and Asia, by Bremen or Hamburg mail—prepayment compulsory:

**NEWSPAPERS—MARKED AS FOLLOWS:**

Bremen, by Bremen mail—2 cents each.  
Hamburg, by Hamburg mail—2 cents each.  
Prussia, Austria and German States, by Bremen and Hamburg mail—3 cents each.  
Lunenburg, by Bremen mail—3 cents each.  
Lunenburg, by Hamburg mail—3 cents each and 1 cent per 1 1/2 ounce.  
Schleswig-Holstein and Denmark, by Bremen or Hamburg mail—3 cents each and 1 cent per 1 1/2 ounce.  
Sweden, by Bremen or Hamburg—3 cents each, and 1 1/2 cent per 1 1/2 ounce.  
Norway, by Bremen or Hamburg—3 cents each, and 3 1/2 cents per 1 1/2 ounce.  
Holland, by Bremen or Hamburg—3 cents each, and 1 cent per 1 1/2 ounce.  
Russia, by Bremen or Hamburg—3 cents each, and 1 cent per 1 1/2 ounce.  
Switzerland, by Bremen or Hamburg—4 cents each.  
Italy, by Bremen or Hamburg—3 cents each, and 5 1/2 cents per 1 1/2 ounce.  
Turkey, by Bremen or Hamburg—3 cents each, and 5 1/2 cents per 1 1/2 ounce.  
Greece, by Bremen or Hamburg—3 cents each, and 5 1/2 cents per 1 1/2 ounce.  
Gibraltar, Spain and Portugal, by Bremen or Hamburg—3 cents each, and 5 1/2 cents per 1 1/2 ounce.  
Austria, India and China, by Bremen or Hamburg mail via Marseilles—3 cents each, and 9 cents per 1 1/2 ounce.  
Austria, India and China, by Bremen and Hamburg mails, via Trieste—3 cents each, and 2 cents per 1 1/2 ounce.

Flour and Sawmills, and MACHINERY of all descriptions made and repaired at shortest notice.  
Particular attention paid to repairing Reynolds' Cut-off 5v15q7

**THE SPRINGFIELD MILITARY MUSEUM.**—The museum at Springfield, Mass., is to be made a military storehouse containing articles of great historical value. There will be an almost endless variety of guns—American and foreign, Federal and Confederate, muzzle and breech-loading. A valuable feature will be specimens of the scores of breech loaders which were presented to the commission for examining such arms which met in Springfield some time ago; also photographs of every part of each. Of course, war relics will comprise a prominent part of the collection. Blood-stained guns and swords from many a battle field will be found there, with a large number of specimens of Southern guns, swords and pikes which are so roughly finished as to show that the Confederates were too hard pressed to stop for much "style" in making them, even if they had skilled workmen to do the work in better shape. The museum will be enlarged as relics of various kinds are sent among the old guns forwarded to the armory; and it cannot fail to become a collection of much interest and worth.

**OWENS' RIVER VALLEY.**—This valley, from all accounts, is steadily growing in importance. The climate is remarkably healthy, and the soil yields the various products with astonishing prolificacy. Grapes grow finely, and tobacco flourishes. During the past season several acres of sorghum were planted, yielding finely and producing syrup of a good quality. The cereals flourish amazingly, especially wheat. There are already two flouring mills in the valley, and a splendid article of flour is manufactured. As a cattle raising country it is unsurpassed. There are several sawmills in the neighborhood, and lumber is cheap. A school has been established at one locality, which is attended by about thirty scholars. There are good mines in the neighboring mountains.

**TO CEMENT BRASS ON GLASS.**—Puscher uses a cement particularly adapted for fastening brass on glass lamps, which consists in resin soap—made by boiling three parts of resin with one part of caustic soda and five parts of water, which is mixed with one-half its weight of plaster of paris. This cement has great adhesive power and is not permeable by petroleum; it sets firmly in less than an hour, and is a very slow conductor of heat. Zinc-white, white-lead, or precipitated chalk may be substituted for plaster of paris, but the material will be longer in hardening.

It is expected that the track of the Pacific Railroad coming West from the Missouri, will be laid to Evan's Pass (the highest point to be passed between the two oceans) by the first of January—next week. The distance of that point from Omaha, the western terminus, is 555 miles.

**OIL WELLS.**—Seven thousand nine hundred and thirty oil wells have been sunk in the United States since the year 1861, and have yielded a total product of about 11,640,679 barrels of crude petroleum.

The clock at Hampton Court Palace, England, which was set up in 1540, is said to have been the first clock made in England.

**BEAN'S HISTORY AND DIRECTORY OF NEVADA COUNTY, CALIFORNIA.**

Containing a complete History of the County, with Sketches of the various Towns and Mining Camps, the Names and Occupation of Residents; also, full Statistics of Mining and all other Industrial Resources.

COMPILED BY EDWIN F. BEAN.

Price, \$5—For sale at the office of the Mining and Scientific Press, San Francisco 13v15t

**To Quartz Miners.**

**Mining Secretary.**

THE SUBSCRIBER, HAVING SERVED FOR THE LAST five years as Secretary of various mining companies, feels fully competent to serve in that capacity. Any parties wishing to secure the services of a Secretary can be accommodated on reasonable terms. Information given, and all necessary papers correctly made out. Having had a long experience in the purchasing of goods and machinery for miners, parties in the mines will find it to their advantage, when purchasing agents are employed, to send their orders to the undersigned. J. M. BUFFINGTON, No. 5 Government House, San Francisco. 17v15-1f

**CHALLENGE FOR TWO THOUSAND DOLLARS,**

—AND THE—  
"GOLD MEDAL."

**THE EXCELSIOR PUMP COMPANY**

Hereby challenge Mr. THOMAS HANSBROW in the above amount, to a Mechanical Trial between his "Challenge Pump" and the "Excelsior Pump," the trial to take place in San Francisco, before a

**COMMITTEE OF MECHANICS,**

Each Pump to be constructed in accordance with its patent, and to be tested from their least to their greatest capacity, together with the power required by each Pump. A meeting for settling arrangements for the trial may be had at the office of the MINING AND SCIENTIFIC PRESS. This Challenge open for sixty days.

**The "Excelsior Pump"**

Was NOT entered for the GOLD MEDAL, at the recent State Fair, as it was verbally agreed, by Mr. Hansbrow and Mr. Hooker, that they would not enter their Pumps for the Medal, as no means were provided for testing machinery, and believing that

**Policy, not Merit of Machines,**

Was to govern the award of prizes. The inference is clear—hence the above Challenge.

**CUSHING & HOOKER, Prop'rs.**

Newel Posts and Balustrades CONSTANTLY ON HAND and for Sale.

**THE GOLDEN ERA.**

Founded in 1852, it is the oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent.

**THE GOLDEN ERA**

Is the most universally popular of all the Weekly Journals. It presents forty-eight columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected matter. It is a welcome guest in Cottage and Cabin; the favorite at the fireside in city and country; the most useful, agreeable and altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe and elsewhere. Every household in the mountains and valleys, the cities, towns and mining camps of California, and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor. Inspired with the genius of the age, it is progressive, and aims not so much at distinction as a newspaper, as at honorable success in its capacity of a great Moralizing and Improving Influence, exercising a positive power for good, and wielding a permanent influence, many able and eminent writers choose its columns as a means of communicating with the public. No effort will be spared to make it a thoroughly California newspaper, and worthy of the support of all classes of our citizens.

**Rates of Subscription:**

Machinery.

VARNEY'S PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows: The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the PACIFIC FOUNDRY, San Francisco.

Engines, Boilers, Castings,

AND ALL KINDS OF MACHINERY,

No. 537 Washington, and 532 Merchant st., San Francisco

HAS FOR SALE

- One Engine, 5-Horse Power, \$100
One Engine with Boiler, 7-Horse, 600
One Engine, Link for Hoisting, 15-Horse, 800
Two Engines, Boilers, Port., 16-Horse, 1,200
One Engine, 40-Horse, 1,200
One 30-Horse Boiler, 300

Also, a great variety of

Boilers and Machinery,

CASTINGS OF ALL KINDS,

AT LESS THAN MARKET RATES.

Parties wishing to purchase or sell Machinery, of any kind, can do so to advantage through this agency. 12v15q

Steam Pumps,

FOR DRAINING MINES OR ELEVATING WATER TO ANY HEIGHT.

PICKERING'S GOVERNORS

For Steam Engines.

Giffard's Injectors,

For Feeding Boilers.

STODDART'S IRON WORKS,

Beale Street, San Francisco, 23v12 5m

PATTINSON'S

HURDY-GURDY WATER-WHEEL.

The Inventor of this Wheel having, after much delay, finally obtained the patent for the same, is prepared to sell rights therefor to such as may be desirous of putting them up, or continuing those already in use. This is well known among miners as the "burdy-gurdy wheel," and is considered the most economical Water-Wheel now in use.

Notice is hereby given, that the subscriber is the inventor and holds the patent right for the construction and use of the same; and that no person has a right to manufacture or use them without his permit. 7v15-4y THOMAS PATTINSON

Brodie's Patented Improvements

FOR THE TREATMENT OF Gold and Silver Ores.

BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER. The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms: No. 1—Or 10-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price, \$600

No. 2—Or 15-inch Crusher, capable of similarly pitting through five to six tons per hour, price, \$850
No. 3—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour, price, \$1,200

EXPLANATION OF THE ABOVE DRAWING. The frame is made of cast iron, bound with heavy wrought iron bands, making it very strong, and at the same time light and portable. The crusher is bolted to a wood frame of sufficient height to clear the fly-wheel, and allow the crushed quartz to pass off. The dotted lines show the movable and stationary jaws. Letter A represents the eccentric shaft by which the power is applied direct to the movable jaw. B represents the movable jaw, and C the fixed jaw. D represents the link or radius bar. E represents the bolts for regulating the opening. F, which can be regulated at pleasure, so as to graduate to the size to which it is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designated.

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, D, gives the movable jaw, B, a forward and downward motion at the same time, and which makes the hardest rock yield and separate into fragments of any desired size. The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Rawhide Ranch, Tuolumne county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Fulton Foundry, First street, San Francisco.

The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the Rawhide Ranch, "Mino, in Tuolumne county, CALIFORNIA." RAWHIDE RANCH, Tuolumne Co., Sept. 23, 1866. JAMES BRODIE, Esq., San Francisco—My Dear Sir: It gives me pleasure to inform you that I have for the past three months had one of your largest sized Rock Crushers in use, at the Rawhide Ranch Mining Company's Mill, which has entirely met my expectations, and I have no hesitation in recommending it to all who are in need of a machine for rapidly, cheaply and properly processing quartz for the stamps. Yours truly, R. P. JOHNSON, Supt. Rawhide Ranch Quartz Mill.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.

For the present it is not intended to grant licenses for the use of the improved German Barrel, for a longer term than twelve months. All persons desirous of compromising, without having recourse to legal proceedings, for past infringements, or Nevada county, and can be seen in operation for the limited period named, are requested to address as below. A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 25th, 1866.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—This Dry Crusher has been found the most economical and effective mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1866. JAMES BRODIE, Fulton Foundry, or 103 Jessie Street, San Francisco. Express Building, 402 Montgomery street, San Francisco. 12v13f

E. O. HUNT, Manufacturer of

Windmills, Horse-Powers, Pumps, Paumping Frames and Gearing.

HUNT'S ADJUSTABLE WIND MILLS to have all the sails so arranged as turn edgewise to the wind when the wind is from any quarter. Results can be set at any angle to suit the force of the wind, while the mill is running, by means of the brake lever at a foot of the mill, by any person. HUNT'S SELF-REGULATING MILL is strong, durable and cheap. It is designed to furnish the miner with a cheap and simple apparatus by which the finest free-gold can be saved without loss, requiring little attention, no machinery to drive it, and will positively collect every particle of amalgam, or of waste mercury that may have escaped from mill or sluice, and as these particles are always charged with more or less gold, this item alone, in many instances, will more than pay the cost of this Amalgamator every month. For circulars, and further particulars, address Dr. J. B. BEERS, San Francisco, Per Wells, Fargo & Co's Express. 11v15-6m

DR. BEERS' PATENT

WIRE GAUZE AMALGAMATOR.

THE ATTENTION OF QUARTZ, HYDRAULIC AND Pincer Miners, is called to this new invention for saving Fine Gold. It is designed to furnish the miner with a cheap and simple apparatus by which the finest free-gold can be saved without loss, requiring little attention, no machinery to drive it, and will positively collect every particle of amalgam, or of waste mercury that may have escaped from mill or sluice, and as these particles are always charged with more or less gold, this item alone, in many instances, will more than pay the cost of this Amalgamator every month. For circulars, and further particulars, address Dr. J. B. BEERS, San Francisco, Per Wells, Fargo & Co's Express. 11v15-6m

NELSON & DOBLE,

AGENTS FOR Thomas Firth & Sons' Cast Steel, Files, Etc., Shear, Spring, German, Flow, Blister and Toe Calk Steel, manufacturers of Mill Picks, Sledges, Hammers, Picks, Stone Cutters', Blacksmiths' and Horse-Shoers' Tools, 319 and 321 Pine Street, Between Montgomery and Sansome, San Francisco 10v14qf

THE CELEBRATED

Self Generating Portable Gas Lamp.

This extraordinary Lamp produces its own gas by the vaporization of Petroleum, Naptha, or Benzine. It emits neither smoke nor smell, and burns with a pure white flame, equal in intensity to an ordinary gas burner, and at an expense of from one to three cents per hour only, according to the quantity of light required. It is peculiarly adapted for mining purposes, also for stores, factories, billiard rooms, and, in fact, for all purposes, where regular gas is not available, and for which it is an admirable substitute. As an outdoor light it stands unrivalled, burning with undiminished brilliancy in a strong wind.

Directions for Use.

Charge the reservoir with the prepared fluid, or with Benzine, from half to three-fourths full; allow a portion to run through into the cup, then turn off the tap and ignite the fluid, which will heat the burner sufficiently to generate the gas, which will be seen issuing from the top. The tap must now be turned on, and a steady light will be maintained till the whole of the contents of the reservoir is consumed. A small needle, bent at the point and fixed in a holder, may be occasionally required to clear the minute hole through which the gas issues, and the regulating screw at the bottom turned a little back; but care must be taken not to force the screw too high, and it should never be used to extinguish the light—by turning the tap off, it will gradually go out. When necessary to renew the cotton which is placed in the lower pipe to prevent the too rapid flow of the fluid, the lamp should be placed in a vise and the burner screwed off. The burnt cotton must then be withdrawn, and a fresh piece of cut cotton, not less than one inch wide and four or five inches long, should be doubled over a piece of wire, and inserted into the pipe—the ends cut short off, the burner again screwed on with a little white lead, and the lamp is ready for use. Manufactured solely by JOHN J. HUCKS, original proprietor. Factory, North Beach, San Francisco; and for sale by his agents in every city and town throughout the State. 18v14-5m-8

LEFFEL'S

American Double Turbine

THESE WHEELS, UNEQUALED AND UNRIVALED IN the United States or the world, have been fully tested on this coast, more than forty being in use at this date in California and Oregon, driving all kinds of machinery, Saw Mills, Flour Mills, Quartz Mills, etc., etc. CALIFORNIA REFERENCES.—E. Stockett, Folsom; O. Simons, Oakland, (Mill at Clear Lake); Moran, Colville, Lexington, Santa Clara County; J. Y. McMillan, Lexington-Santa Clara County. Send for Circular to KNAPP & GREAT, Agents for California. 25v13-1yq 310 Washington street, San Francisco.

SUPERIOR CUT-OFF ENGINES.

We desire to call the attention of Engineers, Manufacturers, and Millmen, to the celebrated Hartford Engine,

With Wright's Patent Variable Cut-off, which we are now manufacturing under a license from the Woodruff & Beach Iron Work Co., Hartford, Ct. To parties wishing a First-class

Fuel-Saving Engine,

Simple and durable in construction, this Engine is offered in the belief that it is superior to any other manufactured. It enjoys the very highest reputation in the Atlantic States, where it is well known; over 300 of them having been built by the Woodruff & Beach Company, and being now in successful operation. GODDARD & CO., Pacific Iron Works, 9v15f San Francisco, Aug. 29, 1867.

BLAKE'S QUARTZ BREAKER!

PRICES REDUCED!

MACHINES OF ALL SIZES FOR SALE

BY WM. P. BLAKE,

Corner First and Mission streets, or Box 2,077 3v15f SAN FRANCISCO.

NOTICE TO MERCHANTS

AND MANUFACTURERS.

Moore's Patent Friction Hoist.

Now in successful operation in the principal stores in San Francisco, possesses many advantages over the common hoist—viz. Greater strength, less danger in working, as goods require no slinging or landing, consequently make fewer breakages; requires one man less to operate it; stops with the load at any point, without any fastening or attention from the operator. The undersigned take this opportunity to notify all whom it may concern that they have secured, by letters patent, the application of a friction pawl, or stop, to hoisting machines, and that they will prosecute any party making or using any machine infringing upon the same. VULCAN IRON WORKS CO., By Joseph Moore, President. JOSEPH MOORE. 2v16 1f

Mechanical Drawings.

Persons wishing Mechanical Drawings can obtain the services of competent draughtsmen, by applying to this office

GAS COAL IN THE UNITED STATES.—Notwithstanding the great abundance and excellent quality of heat-generating coals produced in the United States, we have, ever since the introduction of gas into our large cities, been compelled to import the greater part of the coal from which that gas is manufactured. There is now, however, a fair prospect that this drain upon our resources or foreign tax upon our artificial illumination will soon be done away with, by the use of the "Cameron Coal" of Pennsylvania, which is now being mined and sent to market in large quantities. The location of this coal bed is in Cameron county, and at a point readily accessible by a great number of carrying routes, so that it can be transported at about the same price either to the tide water of the Atlantic on the east, or the navigable waters of the Mississippi on the west. After numerous thorough and practical experiments on a large scale its value as a superior gas-producing coal is now considered as quite definitely settled. Quite a number of large companies in Philadelphia, New York, etc., are using it. It is said to produce a coke of very excellent quality. The discovery and introduction of this coal is considered a matter of no inconsiderable importance in the history of our industrial progress.

All About Sending Money by Mail. RATES OF COMMISSION.—The following are the rates charged (in currency) for transmitting money to any part of the United States: On Orders not exceeding \$20, 10 cents. Over \$20 and not exceeding \$50, 25 cents. No fractions of cents to be introduced in an Order. United States Treasury Notes, or National Bank Notes only received or paid. To send over \$50, additional Orders must be obtained. Post Offices where Money Orders may be obtained will furnish blanks as follows, which the applicants will fill out: No. .... Amount .... Date, .... 186 .. MONEY ORDER. Required for the sum of \$.... Payable at .... State of .... Payable to .... Resulting at .... State of .... Sent by .... Residing at .... State of .... ENTERED IN REGISTER. .... Postmaster. The applicant must, in all cases, write his own given name and surname in full, and when the given name of the payee is known, it should be so stated; otherwise initials may be used. The given names of married women must be stated, and not those of their husbands. For example; Mrs. Mary Brown must not be described as Mrs. William Brown. Names of parties and places, and the sums, to be written in the plainest possible manner. As there are several places of the same name in the United States, applicants must be careful to indicate which of them they mean; and the Postmaster will satisfy himself, before writing out the order, that the place indicated is the one intended.
